# AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

WEDNESDAY, MARCH 10, 1971

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
*Washington, D.C.*

The committee met at 10:20 a.m. in room 5110, New Senate Office Building, Hon. Philip A. Hart, presiding.

Present: Senators Hart, Moss, Long, Baker, and Stevens.

## OPENING STATEMENT BY THE CHAIRMAN

Senator HART. The committee will be in order.

Today we are in this Committee on Commerce opening hearings on proposals designed to make automobiles less susceptible to damage. A fair enough question is: Why are you in Congress worrying about how susceptible cars are to damage? We are worrying about it because the citizen and his insurance company are worrying about it.

The citizen is worried because his car is costing him substantial money. No matter how careful a driver he may be, it is difficult to avoid a fender-bender now and then.

Suppose that the citizen is involved in one of these so-called fender-benders at a speed as low as 5 miles per hour, which is the equivalent of walking. By the time he gets his car out of the shop—and that might take several weeks—repairs often might run as high as \$500. This means that he has dipped into his pocket and come up with \$100 cash—if he has a \$100 deductible collision policy. His insurance company pays the remaining \$400 and gets it back from the citizen by charging him, and others like him, more for insurance. Of course, the citizen might not file a claim for the \$400 with his insurance company for fear they will cancel his policy and leave him without insurance for the “big accident.”

Think how nice it would be if the citizen's 5 miles per hour scrape did not cause any damage to his car. It has been estimated that more than a billion dollars a year could be saved if cars were able to withstand low-impact crashes without sustaining damage. That potential savings is more than enough reason, as I see it, for drivers and their elected representatives in Congress to care whether bumpers on cars can really “bump” or whether they are costly and potentially lethal cosmetic fixtures.

If there is no objection, at this point in the record, let there be printed a copy of a bill which I recently introduced which would permit the Secretary of Transportation to set property loss reduction standards for passenger automobiles, thereby paving the way for the kinds of savings discussed above. The bill also has other important features designed to save consumers money. These features will be discussed in subsequent hearings.

(The bill and agency comments follow:)

Staff member assigned to these hearings: S. Lynn Sutcliffe.

92<sup>d</sup> CONGRESS  
1<sup>st</sup> Session

# S. 976

## IN THE SENATE OF THE UNITED STATES

FEBRUARY 25 (legislative day, FEBRUARY 17), 1971

Mr. HART (for himself, Mr. HARTKE, Mr. MAGNUSON, Mr. MUSKIE, Mr. PROX-  
MIRE, and Mr. RIBICOFF) introduced the following bill; which was read  
twice and referred to the Committee on Commerce

---

## A BILL

To amend the National Traffic and Motor Vehicle Safety Act of 1966 in order to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage, and for other purposes.

- 1 *Be it enacted by the Senate and House of Representa-*
- 2 *tives of the United States of America in Congress assembled,*
- 3 That this Act may be cited as the "Motor Vehicle Informa-
- 4 tion and Cost Savings Act".

5

### PURPOSE

- 6 SEC. 2. (a) It is the purpose of this Act, (1) to amend
- 7 the National Traffic and Motor Vehicle Safety Act of 1966
- 8 (hereinafter referred to as "the Act") in order to establish

1 procedures for setting minimum property loss reduction stand-  
2 ards and to promote competition among motor vehicle manu-  
3 facturers in the design, production, and sale of motor vehicles  
4 which are less susceptible to damage in traffic accidents  
5 occurring at normal operating speeds and which lessen the  
6 risk of injury and death to occupants of motor vehicles and  
7 pedestrians involved in traffic accidents, and (2) to provide  
8 for the augmentation and implementation of certain Federal  
9 motor vehicle and highway safety standards.

10 (b) The first section of the Act (15 U.S.C. 1381) is  
11 amended to read as follows: "That the Congress finds and  
12 declares that—

13 " (1) it is necessary to establish motor vehicle safety  
14 standards for motor vehicles and equipment moving in  
15 interstate commerce, to establish testing procedures for  
16 passenger motor vehicles, to establish property loss re-  
17 duction standards, to undertake and support necessary  
18 safety research and development, and to expand the na-  
19 tional driver register; and

20 " (2) it is the purpose of this Act to reduce the  
21 number and severity of traffic accidents, the number of  
22 deaths and injuries resulting from such accidents, and  
23 the extent of property damage and economic losses re-  
24 sulting from such accidents."

1 vehicle manufactured primarily for the transportation of its  
2 operator and passengers upon the public streets, roads, and  
3 highways.”

4 **PROPERTY LOSS REDUCTION STANDARDS**

5 **SEC. 4.** Title I of the Act (15 U.S.C. 1391 et seq.) is  
6 amended by adding at the end thereof the following new  
7 sections:

8 (a) the words “or property loss reduction” after  
9 the words “motor vehicle safety” wherever they occur  
10 following section 102;

11 (b) the words “or property loss reduction stand-  
12 ards” after the words “motor vehicle safety standards”  
13 or “safety standard” wherever they occur following  
14 section 102 (except section 103 (h) ) ; and

15 (c) the words “or property loss reduction stand-  
16 ards” after the words “motor vehicle safety standard”  
17 wherever they occur following section 102 (except  
18 section 103 (g) ).

19 **PUBLIC DISCLOSURE OF COMPARATIVE SAFETY AND SUS-**  
20 **CEPTIBILITY TO DAMAGE OF PARTICULAR MOTOR**  
21 **VEHICLES AND ADDITIONAL STANDARDS**

22 **SEC. 5.** Title I of the Act (15 U.S.C. 1391 et seq.) is  
23 amended by adding at the end thereof the following new  
24 sections:

25 “SEC. 125. (a) The Secretary shall develop and pre-

1 scribe by regulations issued not later than July 1, 1972, a  
2 system of tests and testing procedures designed to allow a  
3 determination and comparison of the susceptibility to dam-  
4 age of passenger motor vehicles involved in traffic accidents  
5 which reasonably may be anticipated to occur at normal  
6 speeds and under normal operating conditions, including,  
7 but not limited to, collisions at speeds of five, ten, and  
8 fifteen miles per hour.

9       “(b) The Secretary shall, as soon as possible, after  
10 July 1, 1972, promulgate property loss reduction standards  
11 which will minimize economic losses associated with motor  
12 vehicle accidents. These standards shall be compatible with  
13 safety standards issued to protect motor vehicle occupants.

14       “(c) The Secretary shall, as soon as practicable, after  
15 July 1, 1972, promulgate a property loss reduction standard  
16 which requires that all motor vehicles manufactured after  
17 January 1, 1975, and offered for sale in the United States,  
18 are so designed and constructed with energy absorbing  
19 bumpers capable of withstanding impacts front and rear of  
20 5 miles per hour into a solid, fixed barrier (as prescribed  
21 by the Society of Automotive Engineers Standard J850)  
22 and the vehicle shall withstand such impacts with a mini-  
23 mum prescribed amount of damage as may be determined  
24 by the Secretary.

25       “(d) (1) The Secretary shall undertake a study of the

1 feasibility of developing tests and testing procedures designed  
2 to allow a determination and comparison of the risk of per-  
3 sonal injury or death to occupants of passenger motor ve-  
4 hicles resulting from traffic accidents which reasonably may  
5 be anticipated to occur at normal speeds and under normal  
6 operating conditions. The Secretary shall report the results  
7 of such study, and his findings and recommendations, in-  
8 cluding any recommendations for additional legislation he  
9 deems necessary, to the President and the Congress by  
10 July 1, 1972.

11 “(2) If the Secretary finds that such tests are feasible  
12 he shall develop and prescribe by regulations issued as soon  
13 as may be practicable such a system of tests and testing  
14 procedures.

15 “SEC. 126. (a) Each manufacturer of motor vehicles  
16 shall test production models of every make and model of  
17 passenger motor vehicle manufactured or imported by him in  
18 accordance with the regulations promulgated by the Secre-  
19 tary under the provisions of section 125 of this title, and  
20 shall furnish the results of such testing, including such data  
21 as the Secretary deems necessary, to the Secretary.

22 “(b) No manufacturer shall sell, offer for sale, intro-  
23 duce or deliver for introduction in interstate commerce, or  
24 import into the United States—

25 “(1) any passenger motor vehicle manufactured on

1 or after January 1, 1973, unless production models of  
2 the make and model of such motor vehicle have been  
3 tested in accordance with the regulations promulgated  
4 by the Secretary under section 125 (a) of this Act; or  
5 “(2) any passenger motor vehicle manufactured on  
6 or after a date one hundred and twenty days after the  
7 date on which regulations governing tests and testing  
8 procedures are promulgated by the Secretary under the  
9 provisions of section 125 (b) of this Act unless a pro-  
10 duction model of the make and model of such motor  
11 vehicle has been tested in accordance with such reg-  
12 ulations.

13 “SEC. 127. (a) The Secretary shall compile informa-  
14 tion submitted to him under testing programs carried out  
15 under the provisions of sections 125 and 126 of this Act,  
16 and furnish it to the public in a simple and readily under-  
17 standable form in order to facilitate comparison among the  
18 various makes and models of passenger motor vehicles with  
19 respect to the factors analyzed by such testing programs.  
20 The information shall include, but not be limited to a com-  
21 parative analysis of the cost of repairing motor vehicles  
22 under section 125 (a) and if practicable under section  
23 125 (d) . The Secretary shall require that the results of such  
24 testing be made available to prospective purchasers of pas-

1 senger motor vehicles by the manufacturer of such motor  
2 vehicles prior to their sale.

3 “(b) The Secretary shall—

4 “(1) make such information available to insurance  
5 companies and business organizations engaged in the  
6 business of selling or underwriting motor vehicle insur-  
7 ance in interstate commerce, for use in determining  
8 premium rates for insurance covering property damages  
9 and personal injury related to the factors tested under  
10 the provisions of section 126 of this Act. Information  
11 furnished shall include, but not be limited to, identifica-  
12 tion of parts, components, systems, and subsystems  
13 damaged or displaced in the motor vehicles tested; and

14 “(2) report to the President and the Congress on  
15 February 1, 1973, on the extent to which the motor  
16 vehicle insurance industry is utilizing such information  
17 in the determination of insurance premium rates, to-  
18 gether with such additional findings and recommenda-  
19 tions, including recommendations for additional legis-  
20 lation, as he deems appropriate. The Secretary is au-  
21 thorized to conduct such studies and surveys as may be  
22 necessary to carry out the purposes of this Act.

23 “(3) The Secretary, not later than February 1,  
24 1974, shall establish procedures requiring the automo-  
25 bile dealers to provide insurance cost data to prospective

9)

1 purchasers that would enable the prospective purchasers  
2 to compare the difference in costs for auto insurance on  
3 the various makes and models of passenger motor vehi-  
4 cles having different occupant injury severity or vehicle  
5 property damage characteristics.

6 "SEC. 128. The Secretary shall, as soon as practicable,  
7 promulgate Federal motor vehicle safety and property loss  
8 reduction standards which require that all motor vehicles  
9 manufactured after January 1, 1975, and offered for sale in  
10 the United States, are so designed and constructed as to  
11 facilitate motor vehicle inspection, and to facilitate the re-  
12 pairs necessary to meet the requirements of such inspection."

13 JUDICIAL REVIEW

14 SEC. 6. Section 105 (a) (1) of the Act (15 U.S.C.  
15 1394 (a) (1) ) is amended by inserting after the words "any  
16 order under section 103" the following: "or 128, or any  
17 regulation issued under section 125."

18 SAFETY RESEARCH

19 SEC. 7. Section 106 (a) of the Act (15 U.S.C.  
20 1395 (a) ) is amended by redesignating paragraphs (2)  
21 and (3) as paragraphs (3) and (4), respectively, and  
22 inserting immediately after paragraph (1), the following  
23 new paragraph:

24 "(2) collecting data from any source for the pur-

1 pose of determining the relationship between passenger  
 2 motor vehicle performance and design characteristics and  
 3 (A) property damage resulting from motor vehicle col-  
 4 lisions, and (B) the occurrence of personal injury or  
 5 death resulting from such accidents;”

6 COOPERATION WITH OTHER AGENCIES

7 SEC. 8. Section 107 of the Act (15 U.S.C. 1396) is  
 8 amended by striking out the period at the end thereof, and  
 9 inserting in lieu thereof a semicolon and the following:

10 “(3) tests and testing procedures established under  
 11 section 125 and methods for inspecting and testing to  
 12 determine compliance with such tests and testing  
 13 procedures.”.

14 PROHIBITION AND EXCEPTIONS

15 SEC. 9. Section 108 (b) of the Act (15 U.S.C. 1397  
 16 (b) ) is amended by—

17 (1) inserting in paragraphs (1), (3), and (5) of  
 18 such section, immediately after the words “subsection  
 19 (a)” wherever they appear in such paragraphs, a  
 20 comma and the words “and section 126 (b),”; and

21 (2) amending paragraphs (2) and (3) of such  
 22 section 108 to read as follows:

23 “(2) Paragraph (1) of subsection (a), and section  
 24 126 (b) shall not apply to any person who establishes that  
 25 he did not have reason to know in the exercise of due care

1 that such vehicle or item of motor vehicle equipment is not  
2 in conformity with applicable Federal motor vehicle safety  
3 standards or property loss reduction standard or, in the case  
4 of a passenger motor vehicle, is not of a make and model  
5 which has been tested in accordance with the requirements  
6 of section 126 (b) , or to any person who, prior to such first  
7 purchase, holds a certificate issued by the manufacturer or  
8 importer of such motor vehicle or motor vehicle equipment,  
9 to the effect that such vehicle or equipment conforms to all  
10 applicable Federal motor vehicle safety standards, and (in  
11 the case of a passenger motor vehicle) is of a make and  
12 model which has been tested in accordance with the require-  
13 ments of section 126 (b) , unless such person knows that  
14 such motor vehicle or motor vehicle equipment does not so  
15 conform or (in the case of a passenger motor vehicle) is not  
16 of a make or model which has been so tested.

17 “(3) A motor vehicle or item of motor vehicle equip-  
18 ment offered for importation in violation of paragraph (1)  
19 of subsection (a) , or section 126 (b) , shall be refused ad-  
20 mission into the United States under joint regulations issued  
21 by the Secretary of the Treasury and the Secretary; except  
22 that the Secretary of the Treasury and the Secretary may,  
23 by such regulations, authorize the importation of such ve-  
24 hicle or item of motor vehicle equipment into the United  
25 States upon such terms and conditions (including the fur-

1 nishing of a bond) as may appear to them appropriate to  
 2 insure that any such motor vehicle or item of motor vehicle  
 3 equipment will be brought into conformity with any ap-  
 4 plicable Federal motor vehicle safety or property loss re-  
 5 duction standard prescribed under this title, brought into  
 6 conformity with the requirements of section 126 (b) , or will  
 7 be exported or abandoned to the United States.”.

#### 8 PENALTIES

9 SEC. 10. Section 109 (a) of the Act (15 U.S.C.  
 10 1398 (a) ) is amended to read as follows:

11 “SEC. 109. (a) Whoever—

12 “(1) violates any provision of—

13 “(A) section 108 (relating to motor vehicle  
 14 safety standards or property loss reduction  
 15 standards) ;

16 “(B) subsection (c) or (d) of section 112  
 17 (relating to keeping records and reporting data) ;

18 “(C) section 114 (relating to certification) ; or

19 “(D) section 126 (relating to passenger motor  
 20 vehicle testing) ; or

21 “(2) refuses to permit an inspection authorized  
 22 under section 112 (a) and (b) shall be subject to a  
 23 civil penalty of not to exceed \$5,000 for each such  
 24 violation or refusal. A violation of a provision of such

1 sections or regulations issued thereunder, shall consti-  
 2 tute a separate violation with respect to each motor  
 3 vehicle sold, offered for sale, introduced or delivered for  
 4 introduction in interstate commerce, or imported into  
 5 the United States in violation of such provisions or  
 6 regulations, and with respect to each failure or refusal  
 7 to allow or perform an act required thereby. A refusal  
 8 to allow an inspection authorized under section 112 (a)  
 9 and (b), or a refusal or failure to allow or perform an  
 10 act required thereby, shall constitute a separate viola-  
 11 tion with respect to each day such refusal or failure  
 12 continues.”

#### 13 INJUNCTIVE RELIEF

14 SEC. 11. Section 110(a) of the Act (15 U.S.C.  
 15 1399(a)) is amended by inserting in the first sentence  
 16 thereof, immediately after the words “standards prescribed  
 17 pursuant to this title”, a comma and the following: “or to  
 18 the requirements of section 126(b)”.

#### 19 REPURCHASE OR REPLACEMENT

20 SEC. 12. Section 111(a) of the Act (15 U.S.C.  
 21 1400(a)) is amended by inserting immediately after the  
 22 words “applicable Federal motor vehicle safety standards”  
 23 or property loss reduction standards the following: “or the  
 24 requirements of section 126(b)”.

## 1           INSPECTION OF MANUFACTURING FACILITIES

2           SEC. 13. Section 112(b) of the Act (15 U.S.C.  
3 1401(b)) is amended by inserting, immediately after the  
4 words "or are held for sale after such introduction", a  
5 comma and the following: "or are held after being tested  
6 in accordance with the requirements of section 126(b)".

## 7           CERTIFICATION OF CONFORMITY

8           SEC. 14. Section 114 of the Act (15 U.S.C. 1403) is  
9 amended by inserting before the period at the end of the  
10 first sentence a comma and the following: "and that the  
11 particular make and model of such motor vehicle has  
12 been tested in accordance with the requirements of section  
13 126(a)".

## 14           TITLE V

15   DIAGNOSTIC INSPECTIONS, REGISTRATIONS AND TITLING  
16           STANDARDS

17           SEC. 501. (a) The Secretary of Transportation shall,  
18 not later than January 1, 1973, amend highway safety pro-  
19 gram standard number 1, relating to periodic motor vehicle  
20 inspection, issued June 27, 1967, under the provisions of  
21 section 402(a) of title 23, United States Code, to include  
22 the following additional provisions:

23           (1) The standard shall require inspection of a motor  
24 vehicle whenever the title to the motor vehicle is transferred  
25 for purposes other than resale, and whenever the motor

1 vehicles, automotive repair parts or accessories: *Provided*,  
2 subsystem, or functional nonoperational part, as defined by  
3 the Secretary, is damaged.

4 (2) The standard shall require that a certificate of  
5 safe operating condition shall be delivered by the seller of a  
6 motor vehicle to the purchaser at the time of sale. The cer-  
7 tificate shall be prepared and signed by an inspector trained  
8 to perform this duty. The inspector shall be certified by the  
9 State in accordance with provisions established by the Sec-  
10 retary. No motor vehicle inspector may be certified by any  
11 State if he owns or receives any benefit in or from a busi-  
12 ness or enterprise engaged in the repair or sale of motor  
13 vehicles, automotive repair parts or accessories: *Provided*,  
14 That upon approval of the Secretary, a State may certify a  
15 motor vehicle inspector receiving such benefit where the  
16 vehicle population to be served is insufficient to make inde-  
17 pendent motor vehicle inspectors feasible and such State  
18 makes provision for protecting the public from any conflict  
19 of interest resulting from such certification.

20 (3) The standard shall be expressed in terms of motor  
21 vehicle safety performance applicable to new or used motor  
22 vehicles.

23 (b) The Secretary shall, not later than January 1,  
24 1973, amend highway safety program standard numbered 2,  
25 relating to motor vehicle registration, issued on June 27,

1 1967, under the provisions of section 402 (a) of title 23,  
 2 United States Code, to include requirements for a State motor  
 3 vehicle registration and uniform certificate of title program  
 4 similar to the registration and title program contemplated by  
 5 the Uniform Motor Vehicle Code and Model Traffic Ordinance,  
 6 chapter 3, "Certificates of Title and Registration of  
 7 Vehicles" revised 1968 and published by the National Committee  
 8 on Uniform Traffic Laws and Ordinances, Washington,  
 9 District of Columbia.

10 **REPORTS ON IMPLEMENTATION**

11 **SEC. 502. (a)** The Secretary shall report to the President  
 12 and Congress by January 1, 1972, the extent to which  
 13 the States have implemented programs in accordance with the  
 14 provisions of highway safety program standards numbered 1  
 15 and 2, relating to periodic motor vehicle inspection and motor  
 16 vehicle registration, respectively, as issued on June 27, 1967,  
 17 and make legislative recommendations for Federal financial  
 18 and other assistance, as he deems necessary in order to facilitate  
 19 compliance by the States by January 1, 1973.

20 **(b)** The Secretary shall provide for the States financial  
 21 incentive programs for establishing the inspection and titling  
 22 standards of this title. Each State certified by the Secretary  
 23 as being in compliance with the provisions of this title shall,  
 24 after January 1, 1973, receive not less than 10 per centum  
 25 nor more than 50 per centum of the annual costs of such pro-

1 grams, the percentage to be determined by the Secretary  
2 based on degree of compliance. The funds for these incentive  
3 programs shall be paid from the Federal Aid Highway Trust  
4 Funds apportioned on or after January 1, 1973.

5 (c) The Secretary shall report to the President and  
6 Congress by January 1, 1974, the extent to which the  
7 States have implemented programs in accordance with the  
8 provisions of section 501 of this Act, and make legislative  
9 recommendations, for Federal financial and other assistance,  
10 as he deems necessary to facilitate complete compliance by  
11 the States not later than January 1, 1975.

12 (d) Not later than July 1, 1973 the Secretary shall—

13 (1) certify each State program of motor vehicle  
14 inspection and motor vehicle registration which meets  
15 the requirements of the applicable standard;

16 (2) the Secretary shall not approve any State high-  
17 way safety program under this section which does not  
18 establish motor vehicle inspection or motor vehicle  
19 registration programs meeting the requirements of  
20 section 501 of this title and the appropriate Federal  
21 highway safety program standard; and

22 (3) funds authorized to be appropriated to carry  
23 out the provisions of section 501 and this section shall  
24 be used to aid the States to conduct the highway safety  
25 program approved in accordance with subsection (a),

1 (b), and (c) hereof. Federal aid highway funds ap-  
2 portioned on or after January 1, 1975, to any State  
3 which is not implementing a highway safety program  
4 approved by the Secretary in accordance with this sec-  
5 tion shall be reduced for the first year of noncompliance  
6 by amounts equal to 10 per centum of the amounts  
7 which would otherwise be apportioned to such State  
8 under section 104 of title 23, United States Code, with  
9 the reduction of an additional 10 per centum for each  
10 succeeding year of noncompliance, but not in excess  
11 of a total of 50 per centum, until such time as the  
12 State is implementing an approved highway safety  
13 program certified by the Secretary in accordance with  
14 this subparagraph (d). Any amount which is with-  
15 held from apportionment to any State hereunder shall  
16 be reapportioned to the other States.

17 (e) In order to carry out the provisions of this sec-  
18 tion, the Secretary may—

19 (A) assist, by contract, grant, or any other arrange-  
20 ment, any State in establishing or improving programs  
21 of periodic motor vehicle inspection and motor vehicle  
22 registration;

23 (B) use the personnel, facilities, and information  
24 of Federal agencies, and of State and local public

1 agencies, with the consent of such agencies, with or  
2 without reimbursement for such use;

3 (C) enter into contracts or other arrangements and  
4 modifications thereof, and make advance, progress, and  
5 other necessary payments;

6 (D) obtain the services of experts and consultants  
7 in accordance with the provisions of section 3109 of  
8 title 5, United States Code; ~~and~~

9 (E) issue, amend, and repeal such rules and regu-  
10 lations as may be necessary; and

11 (F) take such other appropriate action as may be  
12 necessary.

13 SEC. 503. There are authorized to be appropriated to  
14 the Department of Transportation such sums as may be  
15 necessary to carry out the provisions of this Act.

COMPTROLLER GENERAL OF THE UNITED STATES,  
*Washington, D.C., March 29, 1971.*

HON. WARREN G. MAGNUSON,  
*Chairman, Committee on Commerce,  
 U.S. Senate.*

DEAR MR. CHAIRMAN: By letter of March 8, 1971, you requested our comments on S. 976, 92d Congress, entitled: "A BILL To amend the National Traffic and Motor Vehicle Safety Act of 1966 in order to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage, and for other purposes."

While we have no special information as to the advantages or disadvantages of this measure and, therefore, make no comments concerning its enactment, we recommend the addition of provisions for records retention and access to records for the purpose of audit. Paragraphs (A) and (C) of subsection 502(e) authorize the Secretary of Transportation to enter into grants, contracts or any other arrangement, including such assistance to States, in order to carry out the provisions of section 502. Since there are no record provisions in section 502, we suggest the addition of subsections (f) and (g) as follows:

"(f) Each recipient of assistance under this section pursuant to grants, contracts or any other arrangement entered into under other than competitive bidding procedures shall keep such records as the Secretary of Transportation shall prescribe, including records which fully disclose the amount and disposition by such recipient of the proceeds of such assistance, the total cost of the project or undertaking in connection with which such assistance is given or used, and the amount of that portion of the cost of the project or undertaking supplied by other sources, and such other records as will facilitate an effective audit.

"(g) The Secretary of Transportation and the Comptroller General of the United States, or any of their duly authorized representatives, shall have access for the purpose of audit and examination to any books, documents, papers, and records of the recipients that are pertinent to the grants, contracts or any other arrangement entered under this section under other than competitive bidding procedures."

Under section 202 of the Intergovernmental Cooperation Act of 1968, Pub. L. 90-577, 82 Stat. 1101, the Comptroller General and heads of Federal agencies have access to records pertaining to grants-in-aid received by States. However, section 202 does not cover contracts or any other arrangement for financial assistance except grants to States.

The language in lines 1 through 3 of page 15 (section 501(a)(1)) is garbled and should be clarified. Section 14(a)(1) of S. 4331, 91st Congress, 2d session, which is otherwise identical to section 501(a)(1) of S. 976 reads as follows in place of the garbled language:

"vehicle sustains damage if any safety-related mechanism, subsystem, or functional nonoperational part, as defined by the Secretary, is damaged."

Sincerely yours,

R. F. KELLER,  
*Assistant Comptroller General of the United States.*

---

OFFICE OF THE DEPUTY ATTORNEY GENERAL,  
*Washington, D.C., May 28, 1971.*

HON. WARREN G. MAGNUSON,  
*Chairman, Committee on Commerce,  
 U.S. Senate, Washington, D.C.*

DEAR SENATOR: This is in response to your request for the views of the Department of Justice on S. 976, a bill "To amend the National Traffic and Motor Vehicle Safety Act of 1966 in order to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage, and for other purposes."

The preliminary sections of the bill would broaden the declaration of purposes contained in the Act of 1966 and add new definitions. Substantive provisions direct the Secretary of Transportation to develop and prescribe regulations by July 1, 1972, establishing a system of tests and test procedures for determining susceptibility to damage of passenger cars in low speed collisions. Cars manufactured subsequent to January 1, 1973 would be required to be subjected to the

tests by the manufacturers and no car which had not been so tested could be sold or delivered in interstate commerce. It would be required that the results of such testing be made available to prospective purchasers by the manufacturer.

The Secretary of Transportation would also be required to promulgate property loss reduction standards designed to minimize economic losses associated with automobile accidents and to promulgate a standard requiring energy absorbing bumpers in all cars manufactured after January 1, 1974.

The bill directs the Secretary of Transportation to conduct a feasibility study regarding the development of tests to determine anticipated injuries to occupants of motor vehicles in collisions and to report his findings and recommendations to the President and Congress by July 1, 1972. If tests are found feasible, the Secretary would be required to implement the testing by prescribing regulations.

The Secretary of Transportation would be required to make available to the public and disseminate to insurance companies information submitted to him from the testing programs and report to the President and Congress the extent to which such information is utilized in determining insurance rates. By February 1, 1975, car dealers would be required to provide comparative cost data on auto insurance to prospective purchasers of vehicles with different occupant injury severity or property damage characteristics.

In addition the bill would strengthen and implement vehicle inspection standards and establish a nationwide uniform titling system.

Under the terms of the bill, the Secretary of Transportation would report to the President and Congress by January 1, 1974, on the extent to which the States have implemented programs in accordance with those provisions of the bill concerned with inspection and registration standards. Financial incentive programs would be provided for the States for establishing the inspection and titling standards.

Whether this legislation should be enacted involves questions as to which the Department of Justice defers to the Department of Transportation.

The Office of Management and Budget has advised that there is no objection to the submission of this report from the standpoint of the Administration's program.

Sincerely,

RICHARD G. KLEINDIENST,  
*Deputy Attorney General.*

---

NATIONAL SCIENCE FOUNDATION,  
*Washington, D.C., June 16, 1971.*

HON. WARREN G. MAGNUSON,  
*Chairman, Committee on Commerce,*  
*U.S. Senate, Washington, D.C.*

DEAR MR. CHAIRMAN: This is in further reference to your recent letters requesting the comments of the National Science Foundation on S. 976, to amend the National Traffic and Motor Vehicle Safety Act of 1966, and amendments to be proposed to S. 976.

Inasmuch as the legislation deals with an area in which the Foundation has no direct responsibility, we defer to the views of the Department of Transportation and other agencies directly affected by the legislation.

The Office of Management and Budget has advised us that there is no objection to the submission of this report from the viewpoint of the Administration's program.

Sincerely yours,

W. D. McELROY,  
*Director.*

Senator HART. When a Senator from Utah or a Senator from Michigan or any other of us sit in hearings, we like to think that the subject is so important that it justifies the time and effort involved. I do not think you have to be a Senator from Michigan to see that the subjects we are considering today are important.

We are beginning on a legislative road which conceivably may reshape an industry that employs 1 out of 7 people in this country. We are attempting to cut economic loss from auto accidents which now take

a total of about \$2 million an hour. We seek ways to eliminate as much as possible, the \$8 to \$10 billion that consumers waste yearly for auto repairs which either are unneeded, done improperly, or not even done and yet paid for. We seek to lower auto insurance premiums which have reached more than \$1,000 a year for some unfortunate drivers; and further, we seek to lower the number of stolen cars which are costing the public, directly and indirectly, \$1½ billion a year.

Now, if those assignments were not adequate and sufficient for what we are doing, we are attempting also to save lives by encouraging the production of safer cars and establishing an inspection system which will detect the car headed for an accident before the wreck occurs.

Before inviting our first witness, Dr. Haddon, may I inquire of Senator Moss if he has any comment to make?

Senator Moss. Thank you, Mr. Chairman.

I do not have anything really to add. I think you have pointed out the reason that this matter is of importance—national importance—and the waste and loss that our citizens experience in automobile collisions and damage and repair of that damage has reached a staggering figure; and for this reason I am interested in hearing the testimony and hope that we can follow and get some real improvement in the structuring of vehicles so that damages would not occur so easily.

Senator HART. Does the Senator from Tennessee, Mr. Baker have a statement?

Senator BAKER. Mr. Chairman, I have no opening statement and no remarks at this time. I think these are going to be interesting hearings and I look forward to hearing the first witness.

Senator HART. Our first witness is Dr. William Haddon, the president of the Insurance Institute for Highway Safety. We have asked Dr. Haddon to comment on the need for legislation requiring the production of cars which minimize property damage in low-speed crashes.

He is the producer and director, and I suppose he holds the copyright, on one of the most interesting short films that any of us have seen in the last couple of years. I am sure it grated on the nerves of some when he first displayed it to this committee many months ago. I sense now that it has the seal of approval of everybody because everybody seems to talk about it without showing any outward sign of rage. Indeed, everybody now is busy implying that it was their idea to begin with, but I think it was Dr. Haddon's.

#### **STATEMENT OF DR. WILLIAM HADDON, JR., PRESIDENT, INSURANCE INSTITUTE FOR HIGHWAY SAFETY**

Dr. HADDON. Thank you, Mr. Chairman.

It is a pleasure to be here again before you and the other members of this committee. I am here today to present the results of the present series of low-speed crash tests conducted by the Insurance Institute for Highway Safety.

Before doing so, however, a few words of background: The institute is an independent, nonprofit, scientific, and educational organization. It is dedicated to reducing the losses, deaths, injuries, and property damage resulting from crashes on our Nation's highways. The institute is supported by the American Insurance Association, the National Association of Automotive Mutual Insurance Companies, the

National Association of Independent Insurers, and several independent companies.

The institute began low-speed crash tests of new-model automobiles in 1969. Until then, there had been virtually no recognition of the relationship between high automobile repair costs and the designed-in delicateness of the automobiles themselves.

Three basic questions needed answering. First, we wanted to know how much delicateness was being designed and built into new-model cars. To answer this we crashed four of the most popular 1969 sedan models into a standard test barrier at 5 miles per hour front and rear, 10 miles per hour front to barrier, 10 miles per hour in two-car configurations, front to rear and front to side, 15 miles per hour front into barrier. The results were illuminating; for example, in the 5 miles per hour front-into-barrier crashes, the four cars averaged \$200 in estimated repair costs per car.

Then we asked how large a proportion of the total vehicular crash damage low-speed crashes might account for. Working with data provided by a major automobile insurance company encompassing a sample of thousands of auto property damage claim closures during a 6-month period of 1968-69, we discovered that 94 percent were for \$500 or less.

The third question was whether such low-speed crash damage could be eliminated by alterations in vehicular design. In fact, one of the many available on the shelf solutions was presented to the Senate Antitrust and Monopoly Subcommittee,<sup>1</sup> your committee, at the same time by an independent aerospace manufacturer. Some members of this committee may have since seen demonstrations of one or more of the several other energy-absorbing front and rear end design options available to eliminate low-speed crash damage.

With the introduction of 1970-model automobiles we expanded our crash tests to include 12 popular models—the four sedans, four so-called “pony cars,” and four small cars. The filmed results of both the 1969-model and 1970-model cars were presented at hearings of the Senate Subcommittee on Antitrust and Monopoly.<sup>1</sup> The results of the 1969 and 1970 model low-speed crash tests are shown in appendix A attached to my testimony.

As our test results have become known, public and private concern about the problem of needless delicateness in auto exteriors has surfaced. The bills you are considering today reflect that concern. Also a number of State legislatures are actively considering legislation to require that automobiles withstand low-speed crashes without damage; one State, Florida, enacted such a law last year.<sup>2</sup> Further, a number of insurance companies have announced premium reductions to encourage the offering in the marketplace of automobiles that are not susceptible to low-speed crash damage. Finally, there appears to have been an increase in efforts by independent designers and developers to apply long- and well-known energy absorbing principles as a means of providing crashworthy automobile bumpers, and a steady increase in editorial and public demand for solutions to the automobile fragility problem.

<sup>1 2</sup> See reference on p. 53.

Unfortunately, although the techniques for solving the problem have been available for years, the results of our most recently completed series of tests—involving 1971 model automobiles—show that they continue to be ignored in the design and manufacture of new cars being sold to consumers today. The technological remedies remain on the shelf, where they have gathered dust for costly years.

The baseline of low-speed crash damage reflected in estimated repair costs generated in our 1971 model tests on balance appears to have worsened. For example, for the four sedans, the only like models crashed both last year and this year, the average estimated repair costs compare as follows:

When crashed front end into the test barrier at 5 miles per hour, \$215.64 for 1970 models, \$331.69 for 1971 models;

When crashed rear end into the barrier at 5 miles per hour, \$218.66 for 1970 models, \$329.28 for 1971 models;

When crashed into like models front-into-rear at 10 miles per hour, \$558.04 for 1970 models, \$516.40—the only improvement—for 1971 models;

And when crashed into like models front into side at 10 miles per hour, \$499.36 for 1970 models, \$637.76 for 1971 models.

The largely cosmetic, eggshell front and rear ends of new automobiles remain with us in showrooms and on the streets, insuring, for some time to come, the continued operation of a highly remunerative market in replacement parts sales, most of which automobile design has made certain will be made by the maker of the automobile itself.

Many of you may have noticed the new attention that is being paid in some media advertising of new model automobiles to the issues of occupant safety and protection from vehicle damage. In promotions for some of the 1971 models, we have noted claims—albeit sometimes veiled and couched in careful innuendo—of improved crashworthiness of bumpers. As you watch the film of our 1971 model crash test, you will want to pay particular attention to at least three of these.

1. The Pontiac Firebird, which has for the last few years featured what is referred to as the “Endura” front end. A company promotional booklet on 1971 Pontiac models calls the Endura “amazing.”<sup>3</sup> An automotive magazine has described the front end design as “energy absorbing.”<sup>4</sup>

2. The 1971 Buick Skylark’s bumper, of which a company official said during a press conference last autumn:

... (I)t will withstand about four times as much force from any intruding or any impacting object than the 1970 bumpers. So we made a very dramatic improvement in our bumper protection.<sup>5</sup>

3. The 1971 Plymouth Satellite, which features what one automotive magazine called a “heavy loop bumper (which) provides complete protection for recessed headlights and black-out grille,”<sup>6</sup> and which a promotional brochure described as a “massive front bumper.”<sup>7</sup>

Before showing the film, a word about the test procedures used in this series: Our tests are now being conducted by EG&G, Inc., an established leader in the development and use of advanced technology instrumentation and data gathering systems, lighting products and photographic systems. They were conducted at a specially designed and

<sup>3 4 5 6 7</sup> See reference on p. 53.

constructed indoor testing facility. Whereas in the past the test vehicles were towed in neutral into the obstacle—the barrier or second car—by another vehicle, this year's models were actually "driven" into the crash under their own power from a remote control console, thus more closely simulating real world conditions.

Since each vehicle being tested was driven into the test barrier or stationary target car under its own power, in some of the tests, notably the sedans test-crashed into the barrier at 5 miles per hour, the cars were not braked immediately following the first impact. These cars rebounded from the barrier and, since they were still in forward gear, tapped the barrier again—a phenomenon not unknown in real-world low speed crashes, incidentally, as when a motorist is unable in a crash to apply the brakes or, in a standard transmission car, disengage the clutch soon enough to avoid successive collisions. These secondary taps will be clearly visible on the screen as you view the film of the tests.

Senator HART. Doctor, you're explaining that this new film will show cars actually driven whereas in the earlier film they were towed. Is the failure of the 1971 models—or is the still increased costs to repair a 5-mile damage in the 1971 models the result of the different method of putting the 1971 into the barrier than the 1970?

Dr. HADDON. We wondered about that, Mr. Chairman, and it is an excellent question; and as a result, we looked at this very carefully to determine whether or not the second collisions actually caused additional damage.

We asked our contractor, Hydrospace Research Corp. of Rockville, Md., a subsidiary of E.G. & G., to examine data from each of the subject tests. The second collisions, which occurred in three of the 48 tests to date, were not of sufficient force to register any data on floorboard mounted accelerometers which had been placed in the cars before the tests, nor to register on audiotrack records taken of each crash. Also, the damage appraisals on these cars did not indicate any unexpected high values.

We concluded, therefore, that the second collisions were not severe enough to cause added vehicle damage. On the other hand, to more closely simulate real-world events, it would be more realistic to include these secondary taps.

I think the short answer is we do not think so and we have good data to support that position.

As with our 1969- and 1970-model tests, estimating of repair costs following each crash was done by a panel of three automobile damage appraisers. The cost estimates also reflect inflation's toll on crash-car owners, both in terms of labor costs and replacement parts prices. I might add, incidentally, that the increase from last year to this year is not predominantly accounted for by the \$1 increase in labor costs. This is a relatively small part of the increase on average, and much larger increases are apparently coming from the delicateness of the cars themselves and from inflation in the cost to purchase the parts themselves.

In previous years' crash tests, we used the rate—modest even then by national standards—of \$7 per hour for labor. This year we have raised this to \$8 per hour, a rate still considerably below that charged in many parts of the United States today.

The total estimated repair cost after each test crash is shown in a chart included in this testimony at the end of the film. In the film you will see tests involving four series of crashes—front into barrier at 5 miles per hour, rear into barrier at 5 miles per hour, and intervehicular tests of identical vehicles front into rear and front into side, both at 10 miles per hour. The tests involve 12 models of automobiles: four sedans, four small cars including three new domestic competitors to the imports, and four intermediate-sized cars. Now, the film of the 1971 model low speed crash tests. As you view these crashes, it is easy to see why these automobile designs guarantee huge sales in crash replacement parts that are available only from those who possess the specially designed equipment which fabricated the costly, delicate, original equipment parts in the first place.

Mr. Chairman and members of the committee, if I may suggest, if you would care to move to your left you would be able to see this film without parallax.

Mr. Chairman and members of the committee, I would also call your attention to the fact that the projector we have with us is capable of holding single frames and also can be reversed in case you would like to view a sequence another time.

(Film begins.)

A man's walking speed approximates 5 miles per hour. Here you can see a man hitting a wall at that speed with no damage to himself. On a football field men collide at 10 and 15 miles per hour, and at even greater speeds, often without damage.

Here we begin the 5 miles per hour barrier crash tests with the Chevrolet Impala, four-door sedan, for \$367, at walking speed. You will notice the man in each of these, either walking or jogging later in the 10 miles per hour crashes.

Here is the Ford Galaxie, a family automobile, for \$341, at walking speed.

Next, the Plymouth Fury. As you can see, the bumper of this car failed to protect the sheet metal of the quarter panel which was designed to be right out there with it.

This car, the American Motors Ambassador, has so-called "bumper guards." They acted to "roll" the bumper on its mounts and helped aggravate the damage. This was the highest repair cost estimate of the four sedans in this series. Of the total \$415, \$123 was due to radiator and fan blade damage. In addition, the left front door was pushed out of alignment. You can see the results of this walking speed crash.

Needless to say, if this occurred on the road, it would usually involve police investigation, tying up valuable manpower, and all sorts of other problems.

And the VW, \$130.

Now we have the Chevrolet Vega, with an estimated repair cost of \$181, and you can see all the damage to the front end.

And the Ford Pinto.

Again, in this crash here, the AMC Gremlin, you can see how the so-called bumper guards roll the bumper back. You see it turning down.

Here we have the Pontiac Firebird I referred to earlier. This car is equipped with the so-called Endura front end bumper. While other body damage was relatively low, the bumper had to be replaced and refinished, at an estimated cost of \$161.20. Some bumper!

This is the Buick Skylark. It is equipped with the bumper a company official said could take "four times as much force"<sup>5</sup> as last year's models. It allowed the car to sustain obvious massive damage and to record the highest estimated repair cost in the 5-mile-per-hour front-into-barrier crash series—\$427.

This is the Mercury Montego. As you can see, the radiator of this car suffered a leak in the test crash. The radiator and fan repair estimate came to \$100 of the overall \$402 estimate.

The so-called full loop bumper is found on this car, the Plymouth Satellite. Though it generated the lowest repair cost estimate of the 5-mile-per-hour front-into-barrier test series—\$98—still its radiator core assembly needed repair. Notice the radiator leak in the closeup view.

Everyone of these 5-mile-an-hour front-into-barrier crashes should have resulted in zero damage.

And now the 5-mile-per-hour rear-into-barrier crash tests.

This sedan experienced the most damage of any in the 5-mile-per-hour series, either front or rear—\$447. The bumper itself had to be replaced, repairs had to be done on both rear quarter panels, and both rear taillight housings had to be replaced. That is the Chevrolet Impala. You can see the gentle rippling of sheet metal [audience laughter] which, unfortunately, is no laughing matter, and which is what the consumer not only nationwide, but abroad as well, has to put up with.

And the Ford Galaxie—\$318.

Watch on this Plymouth Fury for the rippling of the quarter panel due to the bumper's being rolled into the sheet metal, inflicting the damage of the crash on the weaker, expensive-to-replace structure—needless to say, with expensive damage the result.

And here we have the American Ambassador. How would the driver of this gently hit car get his safety equipment out after the crash? As you can see, the trunk was shattered.

And the VW. Notice that the design of the tailpipes guarantees that they'll be hit.

Notice that some of these repair costs run less than a third of others among competitive automobiles.

Here we have the Chevrolet Vega, and note that these crashes are still at walking speed and are comparable to what cars routinely experience in parking lot and driveway backing maneuvers.

The Ford Pinto. For a mere \$210.

And the American Gremlin. For \$286.

And the Pontiac Firebird again. I should tell you that most of the damage does not show near the bumper itself in this and a number of other crashes. Instead, it happened to the rear quarter panels—rather symmetrically on either side, I might add, as we shall see later on in slides.

Here, the Buick Skylark.

We have been accused, including, of being unscientific because we show someone walking in the background at the speed the car is moving. Apparently this makes it a bit too clear to the people who look at these—the public—how slowly the cars are travelling when they crash.

<sup>5</sup> See reference on p. 53.

And the Mercury Montego. Here damage was sustained by the frame rails, trunk lid and rear floor pan and reinforcements, as well as the expensively sculpted sheet metal. You can see it dimpling all the way up to the door—for \$267.

And here, of course, is the Plymouth Satellite again. This bumper's inadequacy allowed much damage to other, weaker parts of the vehicle structure—again compelling, by vehicle design, the purchase of expensive crash parts.

And now our 10-mile-per-hour intervehicular tests, first impacting one car into the rear of an identical model that is stationary and in neutral.

The Chevrolet Impala. You can see the fellow jogging in the background. Notice the mismatch problem here even between identical automobiles produced by the same manufacturer. For \$501. Here you see some of the damage.

Here you have the Ford Galaxie. When the front and rear bumper designs chosen by the manufacturer for even the same model aggravate damage by failing to mesh properly, as here, a well-known design principle has been cast aside. As an executive engineer, speaking for the manufacturer of this vehicle, testified last year, "Regardless of other requirements, the front and rear bumpers of a given car line must match at design and curb attitudes with no resultant damage to components." \* and here you see the split front bumper, believe it or not, and rear end closeups.

Now the Plymouth Fury. Again jogging speed, mismatch problem, and all of the rest—these carefully designed structures, which you can see. For \$448.

Now here we have coming up the American Ambassador, and I want you to again watch for the bumper guards serving to twist the bumper on its mounts and aggravating the resulting damage. You can see cosmetic junk falling off—some of the junk.

Here is the VW again. This crash gives another excellent demonstration of the bumper mismatch problem. Had these bumpers been designed to meet properly, little damage would have occurred to sheet metal. And yet you can walk down the street and see on parked cars, precisely this sort of thing commonplace in every city in the country. For \$262.

Here we have the Vega again. Note: They don't even come in at the same height, those bumpers; the man jogging in the background; and a small matter of \$521 worth of damage.

Here is the Ford Pinto. Again mismatching bumpers. Also, the impacted car's bumper allowed damage to the rear quarter panel sheet metal, as you will see in a moment. And needless to say, this is not all. You also get all this expensive damage under the bumper, where there should be bumper but isn't.

Here, again, the American Gremlin. Note how the bumperguards of the impacting car's front bumper twisted the bumper out of position and left their calling cards on this rear bumper.

And the Pontiac Firebird. The front end of this car, the so-called Endura design, acts as a battering ram rather than as a properly designed system. As you can see, it left its costly imprint rather sharply on the rear of the impacted Firebird. You will see this a bit better

\* See reference on p. 53.

in a moment in the closeups. That is the result of the Endura bumper on that impacting car.

And here is the Buick Skylark, concerning which we will have a bit more to say later. Now, the front end of the Buick Skylark was designed to have a pointed snout, also. Notice the damage this unnecessary structure sustained in this crash, and the wound it left on the trunk lid of its companion vehicle. Imagine what that would do to a pedestrian, as these, in fact, do do to pedestrians. For children—many of them—this is at head height, and that is the last thing they see this side of eternity.

Here we have the Mercury Montego. Notice the trunk lid that flew open. Again, the front end battering ram left its mark on the rear end of the struck Montego. Notice the disproportionate amount of damage inflicted on the impacted vehicle. You can see how it buries itself right in.

And the Plymouth Satellite. We wish that these did have the competence of design that the term "satellite" implies. The technology exists, gentlemen, to do better than this. Even in these front-to-rear 10-mile-per-hour crashes there is no reason why damages could not have been held absolutely to zero.

And now the 10-mile-per-hour, front-to-side intervehicular crash tests, the last of the series we have completed to date.

And with the Chevy Impala first. All of the General Motors automobiles we crash tested, as this Chevrolet, were equipped with special reinforcing side door beams to reduce the likelihood of intrusion into the passenger compartment by the impacting vehicle, a responsible feature. Note that in this crash test the degree of intrusion is far less than that in the 10-mile-per-hour tests of cars not equipped with such side-door beams.

This crucially important type of device, although first introduced by GM in 1969 models, has not yet been introduced widely in vehicles. A door strength standard was proposed as early as 1967 by the National Highway Traffic Safety Administration—MVSS214—but final action was not taken until October 22, 1970, when the final rule was issued. The earlier proposed effective date of September 1, 1971, was moved to January 1, 1973. Damage costs to the side-struck car, some \$375, are roughly comparable to those for sedans without the beams.

And the Ford Galaxie. This Ford Galaxie also was equipped with a side-door beam. Again, passenger compartment intrusion—but not repair cost—was reduced compared to the cars not equipped with side beams. Incidentally, other Ford models we tested in this series, specifically the Pinto and Mercury Montego, were not found to be equipped with this important safety device, something that I believe has not been publicized especially by the manufacturer.

And here we have the Plymouth Fury. The front fender extension of the impacting car, one of the first pieces to strike the stationary car, shattered and left exposed a sharply pointed fastener which punctured the side of the impacted car. Imagine the damage to a pedestrian speared by that spike. Note that I placed in the record of this committee 3 years ago an example of a head penetrated by a similar design in an earlier model.

Now the American Ambassador. The right front door swung open in this crash, which in the real world would have exposed occupants to

a completely unnecessary hazard. And this, mind you, again is only 10 miles per hour, a jogging speed. Also note the imprint of the so-called bumper guards on the massively damaged side of the impacted Ambassador—and the degree of intrusion permitted by the unreinforced side door structure. So much for this kind of bumper guard, so called.

Next the VW, at a cost for the crash of \$353.

Here we have the Vega again. This new little car on the market also has the stylish—and hostile to occupant, pedestrian and vehicle—snout-designed front end. It sustained, and inflicted, massive damage in even this low-speed crash. \$386.

And the Ford Pinto. Not only did the side window of this Pinto shatter in the crash, showering likely occupants with shards of glass, but it also left a collar of jagged glass in the door frame, ready to snag and lacerate any occupant being tossed back to the side by the car's leveling out.

And here we have the American Gremlin. Note again the dents made by the bumper guards.

And here is the Pontiac Firebird. Again the Pontiac's Endura front end's battering ram contour inflicts heavy damage to the side of the impacted identical car, even though this one is equipped with GM's side door reinforcement beam. It seems that if you put enough of a snout on these, you can even go through the side beam on the same kind of car and get into the passenger compartment. You can see the shower of broken glass hurled into and outside the car. Not only did the side glass break, the antenna-containing windshield also broke and had to be replaced, at a price of almost \$150.

Now the Buick Skylark. Again despite the claims of strengthened bumpers on this Buick model—and if they in fact were strengthened, you can imagine what they were before—the impacting car suffered radiator damage, as it also did in the 5-mile-per-hour front-into-barrier crash and the 10-mile-per-hour front-to-rear crash. \$528 for this crash.

And the Mercury Montego. Notice the battering dam design of this front end again. It insured that extensive damage would occur, including the shattering of the impacted car's side windows. The disproportionate damage done to the impacted car in terms of estimated repair cost is again the effect of the rigid battering ram. As noted before, this 1971 car was not equipped with reinforcing side door beams. Consumers, take note! And that one ran \$828.

The fact, incidentally, that side windows don't need to break is shown by the fact they don't all break in these crashes. Some people can apparently design them so it doesn't happen at even higher speeds.

Now, next we have the Plymouth Satellite. Plymouth's loop bumper design—rigidly constructed and nonenergy absorbing—leaves a deep reminder of itself on the side of the impacted car—again disproportionately inflicting damage in a crash which, in the real world, would have showered occupants of the struck car with glass.

Even in these front-to-side 10-mile-per-hour crashes the likelihood of occupant damage and the magnitude of structural damage could have been largely reduced with proper attention to excellence of design.

(The chart follows:)

**1971 LOW SPEED CRASH TEST RESULTS**  
**Insurance Institute for Highway Safety**

		5 MPH FRONT	5 MPH REAR	10 MPH FRONT	10 MPH FRONT/ REAR*	10 MPH FRONT/ SIDE**	15 MPH FRONT
SEDANS	Chevrolet Impala	367.90	447.00		280.50 221.05	328.85 375.30	
	Ford Galaxie	341.20	318.55		248.15 469.60	241.00 439.35	
	Plymouth Fury	202.25	266.35		201.85 246.80	247.10 306.55	
	AMC Ambassador	415.40	285.20		256.30 141.35	233.25 379.65	
SMALL CARS	Volkswagen	130.75	59.05		81.10 181.75	126.35 227.45	
	Chevrolet Vega	181.30	228.45		276.55 244.60	191.05 195.90	
	Ford Pinto	164.20	210.00		183.35 196.10	151.90 244.15	
	AMC Gremlin	121.30	286.90		253.95 137.65	172.00 329.65	
INTERMEDIATES	Pontiac Firebird	229.00	262.60		77.00 385.60	55.40 458.70	
	Buick Skylark	427.10	226.85		305.75 190.70	354.00 174.50	
	Mercury Montego	402.11	267.35		171.50 469.13	98.85 729.50	
	Plymouth Satellite	98.45	256.35		161.35 241.65	120.95 523.25	

\*In the front-to-rear crashes, the price listed first for each car model is the estimated repair cost for the striking car (front-end damage); listed second is the estimated repair cost for the struck car (rear-end damage).

\*\*In the front-to-side crashes, the price listed first for each model is the estimated repair cost for the striking car (front-end damage); listed second is the estimated repair cost for the struck car (side damage).

Dr. HADDON. Gentlemen, the high base line of damage reflected in these test results is attributable to more than the performance of the clearly inadequate bumpers with which the cars were equipped. It is a product of the overall design of the automobiles—and I might say the design philosophy which seems to be represented so clearly by it—particularly by their front and rear ends.

The question that should concern us is that which examines the use made of the space occupied by the vehicle and its components—whether, for example, the car is heavily laden at its prow and stern with expensive-to-replace cosmetic fringes—costume jewelry—and is adorned with protruding nose cones and upper lip snouts which perform all of the functions of battering rams, or instead is relieved of this pocket-picking ornamentation and, at the same time, equipped with self-restoring, energy absorbing structures.

A few slides<sup>1</sup> will illustrate in detail how the designs of current model vehicles guarantee crash damage. First, some slides detailing what you have already seen in the film—how the bumpers themselves perform by rolling and twisting on their mounts, away from their normal positions, to mangle sheet metal which has been needlessly extended to embrace the outermost extremities of each car, even the bumper mounts themselves—with the public warranted to lose.

The first slide is of the American Ambassador. We have already seen this in the movie. You can see in this closeup how the sheet metal has been placed by design immediately proximate to the bumper, and that the bumper is designed in such a way that it rolls backward to do damage that picks the pockets of the consumers who use these vehicles.

Next we have another view of the American Ambassador damaged in the front to side—the last was front to barrier. Again, the same sort of picture.

Next, the American Motors Gremlin. Again notice all of the damage guaranteed by the design of this car.

Next the Chevy Impala. Notice how that bumper, by its design and the design of the adjacent structure, guarantees that it mangles into the sheet metal even in the low speed crash of 5 miles an hour which produced this pictures—all too common throughout the country and throughout the world, with cars coming from many countries, including the United States, I might add.

Next we have the Chevrolet Vega, rear to barrier, 5 miles an hour. Notice how the sheet metal on the left rear corner has been mangled by the bumper. The bumpers simply do not work.

Next, another picture of the same car, this time, with the same sort of damage, a closeup of the right rear. This is from the rear end to barrier at 5 miles an hour, much the same as going backward into your garage or backing in a parking area.

The next is the Plymouth Fury. This one at 10 miles per hour.

Next, the Buick Skylark. Notice that even the nameplate managed to fall off in this one.

Now some illustrations of how the designs of the front and rear ends, including bumpers, acted to produce damage to side quarter panels of the cars.

Notice how efficiently and precisely the forces of impact are delivered to very expensive sheet metal far removed from the point of impact. In fact, you can see this on both sides, as the next slide shows. Mind you, this is a 5-mile-an-hour, rear-end-to-barrier crash getting both quarter panels.

As I noted during the film, incidentally, the damage is extremely symmetrical, which is not only a comment on our test methods, but also on the design of the car. The cost for straightening each of these quarter panels came to exactly the same.

<sup>1</sup> The slides referred to begin on p. 56.

Next we have the Plymouth Satellite. More of the same. Remarkable how the same kinds of designs produce the same kinds of damage year after year on the same kinds of cars.

Now the Ford Pinto. And you have seen this in the movie. And I must say that those of us who know what is going on are quite familiar with this as we drive in traffic day by day; see car after car as we move slowly back and forth, and in walking down the street, seeing parked car after car that illustrates exactly this pocket-picking design. One could say cotton-picking design also.

Incidentally, you may be curious as to the cause of the dramatic radiator breakage and leakage in the American Ambassador's 5-mile-per-hour front-into-barrier crash test. In this slide you can see the damage, from the inside, to the radiator, how this design allowed the radiator—and mind you, this was at 5 miles per hour, when it should have zero damage, let alone radiator damage—allowed the radiator to be pushed backward into the fan blades, which, because the car was running, chewed into the radiator core, causing the escape of steam and antifreeze you saw early in the film.

Perhaps the most dramatic proof of the function regularly served by contemporary automobile design is in the fanciful—and dangerous—front-end snouts, spearheads and jutting lips styled into today's cars. And I might say this has been going on for a good many years.

The following slides illustrate dramatically what caused the massive damage in some of the intervehicular test crashes you saw in the film:

First, the Chevrolet Impala; second, Ford Galaxie; Chevrolet Vega; Ford Pinto; Buick Skylark; Pontiac Firebird; and Mercury Montego. And again the Mercury Montego, buried deeply—as may happen, one presumes, everywhere these cars are used in actual practice—in the structure of another.

We have noted that, in the course of the rising publicity over improved automobile crashworthiness, some are claiming that it would be impractical now to set even so low as a 5-mile-per-hour no-damage floor for both front and rear ends of cars, and suggesting—and I find this incredible, as I believe the people will and as this committee, I believe, does—that even a two and a half mile per hour no-damage floor be set for automobile rear ends, a slow walk rather than even a fast walk. Gentleman, a man jumping only two and a half inches off the floor lands at two and a half miles per hour. It seems reasonable that automobiles should sustain damage-free rear-end crashes into a barrier at somewhat greater speed—and yet we have seen, in the film of our test crashes, the amounts of damage that those same automobiles sustain at a walking speed of 5 miles per hour.

To cite two other examples, a man landing from a jump of just over 10 inches—less than the distance involved in jumping off a high step—would land on the floor at 5 miles per hour; one landing from slightly over three and a third feet would land at 10 miles per hour.

To this point, Mr. Chairman, I want to comment more specifically on widespread claims that an adequate solution to the problem so dramatically illustrated in these films is a front-end energy-absorbing bumper capable of withstanding a 5-mile-per-hour barrier crash with little or no damage. There is no question that bumpers able to manage energy without damage to vehicle structures at barrier crash speeds up

to and above 10 miles per hour are now, and for some time have been, well within the state of the art, have been on the shelf, so to speak. But at least according to one carmaker, there seems to be a question whether rear-end property damage in low-speed crashes is of sufficient magnitude to justify even a 5-mile-per-hour damage-free rear-end bumper system.

I refer to General Motors Corp.—and I would not refer to a specific company if it were not that I think the quote should be identified—which has circulated an analysis claiming to justify its conclusion that “a separate speed range should be selected for the front and rear bumper systems”—with the rear system set at a much lower range than the front—because “front-end collisions occur two and a half times as frequently as rear end collisions,” according to GM.<sup>9</sup>

If GM's data were representative of the real world, its conclusion might be sound. Based on 13,000 cases under collision coverage written by Motors Insurance Co., its subsidiary, the data say that 58 percent of collisions involved front damage, while only 30 percent involved rear damage. This, GM suggests, means that rear-end damage is much less of a problem than front-end damage.

But it turns out that GM's data, based as they are on what in the insurance field is called collision coverage, and based only on collision coverage, are limited almost entirely to damage to cars that struck something else—another vehicle or a fixed object. Not included, since Motors Insurance Co. does not write property damage insurance, is damage to cars struck by other vehicles, such as those hit by others through absolutely no fault of their own.

We looked at the damage to these struck cars by examining a national sample of approximately 13,000 closed property damage liability claims from one of the country's largest auto insurance companies. The results were quite different from GM's data involving striking vehicles. In our examination 46 percent involved damage to the rear of the car, and only 29 percent involved damage to the front of the car. That is in what are called property damage claims.

Since a figure more nearly reflecting the true role of rear damage in all crashes would include the damage experience both of struck cars and striking cars, we also combined our data with a representative set of closed collision claims from the same company. In result, we found that for every one and twenty-six hundredths collisions involving front damage, one collision involves rear damage—the latter frequently caused to the vehicle of an innocent driver hit by another from behind.

The pacifying assurance that good rear end bumper systems would not be to use GM's term—“cost effective” might also be rather vigorously challenged by the countless car owners whose vehicles each year are mashed from behind.

I also note public claims by some to the effect that providing significant bumper protection front and rear on automobiles would require both considerable extension of vehicle length and vehicle cost. I was not going to mention, incidentally, that the length of vehicles has been going up and down like an accordion at the whim of the manufacturers as far back as I, at least, can remember, and I expect some people here can remember it further than that.

<sup>9</sup> See reference on p. 53.

These and other arguments against improved vehicle crashworthiness are spacious on their face. A policy that provides a safe, damage resistant vehicle would require that snout configurations and fancy tinsel cosmetics be eliminated and their space utilized instead for proper energy management structures, thus both reducing vehicle cost and eliminating low speed crash repair costs. It is a question of how the space occupied by the structure of the vehicle, of whatever length, is to be utilized—by proper energy-absorbing structure which is self-restoring, or by costly, fragile and damage-prone cosmetics.

You saw, for instance, how the sheet metal has been extended right up to and around the bumpers. It doesn't need to be done that way.

By choosing the former option, manufacturers could reduce the initial price of the vehicle or, at worst, maintain it at present levels by elimination of the costly delicacies.

Another aspect of the exterior designs of several of these vehicles flies in the face of the best interests of men, women, and children not only in the United States, but everywhere in the world where these and similar vehicles are used, regardless of country of origin.

Man discovered thousands of years ago that the likelihood and severity of damage to people, as well as to their property, could be greatly decreased if the impacting parts of objects that hit them are designed to guarantee that the forces are spread out rather than localized.

In practice, this health principle is deliberately ignored in design intended to produce impact surfaces that are hard, pointed, rigid, sharp, edged, jagged, or otherwise hurtful on contact with people. Military hardware from all parts of the world, through all the eras of man, illustrates this—witness the edges of swords, the points of spears, warclubs, tomahawks, battering rams, the prows of triremes, and more recently, those pointed shafts of bamboo found along war zone jungle trails.

I would like to illustrate this again with a few quick slides showing our disregard in our environment, our modern environment, for the human beings that are hit so frequently, for whatever reason, by these designs with which we are lacing our entire American environment.

First, the Mercury Montego. Notice the "W-shaped," as it is called, front end. We believe that this serves to trap, for example, children and other pedestrians who are unfortunate enough to be in front of it, and many of these will hit pedestrians—are hitting pedestrians right now. And we believe, in the case of small children, that because of those prows they are not deflected sideways, they can't be under the dynamics of the crash, but instead are channeled under the wheels where they can only sustain, on average, far more lethal, disfiguring, crippling—you name it—injuries than are frequently the case when pedestrians are deflected sideways.

I think that it is about time that all of the American people understood these aspects of their environment.

Here again in the next slide you have the Mercury Montego from another angle. Certainly that impact design speaks for itself.

And I might note, incidentally, that on a number of cars the honeycomb of the grill is made of a plastic which probably doesn't injure as much as hard metal. So one can put this on the front of cars. But now the metal is out there first, sharp and pointed and hard.

In the third slide, again of the Mercury Montego—you have seen this before—notice not only that the central prow is burying itself deeply in the side of the impacted car, but that those vertical choppers on either side are tearing even the sheet metal, as you can see in the foreground.

Next we have the Chevy Vega. Notice the series of prows—pedestrian and vehicle damaging structures. Now this happens to be a design which has a very long history. In fact, if you go back to military hardware, in this case back to the battering rams that were used in the Middle Ages and at other times, you can find precisely this kind of design with a series of points which serve to make damn sure that the forces of the impact are localized so that they destroy structure.

The next slide shows one of these battering rams, the head of an ancient battering ram of many pounds, with precisely this sort of design.

The next time you see that some child was killed or crippled or converted to a paraplegic or blinded, or what have you, by a car, I hope you will think about these things.

Next we again have the Chevy Vega. Again the battering ram designs, the force—localizing structures, whether hitting property or people. This also illustrates that there are many small points on some of these vehicles. And this, too, is a design which has a very long history in military hardware in particular, with such things as the mace shown in the next slide.

Then next we have the Ford Galaxie. More points, macelike points. And in addition to this, many of these vehicles serve to act like choppers. I showed you a vertical chopper in an earlier vehicle. This has some on the sides. And you see them horizontally. You see this here (using electric pointer), for example, on this ridge here and across this point here, and all the way over the other side, and the ridge that doesn't show all the way down the bottom here. And these serve, whether vertically or horizontally, to chop what they hit, localizing the force of the impact. And that is what is going on on our highways, by design, literally nationwide and beyond.

I thought you might be interested that this design also goes very far back. In the next slide, here are some beautifully designed, but correspondingly lethal, Scandinavian ancient bronze axe heads; and you can go almost to any part of the world, to any period of history, and find equivalents.

Next we have the Buick Skylark which has a front beak, this pointed beak right here. I won't even bother again to comment on all the other things. This beak acts precisely like a beak, a bit larger than you see on birds. In the next slide notice that even after the 10-mile-an-hour front and rear impact, this Skylark's beak is essentially undamaged. In fact, if anything, its position is now more treacherous because the lower structure was weaker—the weak bumper problem again. But the sharp beak was still sitting out there after it had cut into the structures which it hit on an identical car. Think of these hitting people!

Now, there are also points on some of these that are more localized. And this, too, has a very long military history. In the next slide we see, again from Scandinavia, some beautifully designed, but lethally pointed structures which make sure that the force of impact penetrates.

Another slide shows the same sort of thing for medieval pole arms, so-called, with all of their choppers and points.

You have already seen the next slide—the pointed structure exposed in a crash of a Plymouth Fury—the same kind of thing is commonplace on our roads in a design which probably had hundreds of engineers working on it. This one, as you remember, was uncovered in a 10-mile-an-hour front to side crash. Notice that it is located in the principal area of pedestrian impact, the right front of the car. And you can visualize where on a pedestrian it would hit, depending on how high the pedestrian was. On a child standing to the height of the front of that vehicle it would penetrate the head. And again there is in the record of this committee just such a case many years in the past, before this vehicle was designed.

In view of what I have just been showing, it can hardly be maintained that using the same lethal shapes for the surfaces of vehicles that can and regularly do impact pedestrians, bicyclists, and other defenseless road users may be excused as an act in ignorance. No stretch of the imagination could suggest that this could be an act of ignorance.

Let me note that the record of this committee served public notice in 1968 that these designs were producing needless spearing and lacerating of Americans—incidentally, with results medically comparable to those produced by devices of warfare.

Eliminating such expensive and needless costume jewelry and substituting design and executive decisions that reflect concern for people will reduce needless human and social, as well as property, damage.

Incidentally, I have refrained by choice from showing you again the close fit between such structures, as I showed you in 1968, and the holes in people that they produce, and needlessly so. But they are in the record in case you want to pull out the not pleasant color photographs which were submitted at that time.

In the April 25, 1968, hearings of the committee<sup>10</sup> I discussed with the committee these pedestrian-be-damned designs, provided medical case studies and photographs showing the unnecessary penetration into bodies of such pointed metal junk sculpture, and placed in the record my letter of December 21, 1967, to auto and truck manufacturers. This letter included the following, and with your permission I quote:

... I am writing concerning the difficult and serious problem of injuries to pedestrians, bicylists and others who are hit by, or who themselves hit, exterior vehicle structures—and the fact that the contour and structure of exterior portions of vehicles often unnecessarily increase the likelihood both of injury and its severity.

As you know, for decades we have been aware medically and from a safety standpoint that structures which localize the forces of impact on the bodies of men, women and children can needlessly contribute to injury, disability, and death. Some 9,300 pedestrians, not to mention bicyclists and others, are killed in the United States each year, and an estimated one-third of a million injured.

Now these are the things that are hitting them, gentlemen; you have seen them on the screen.

Again quoting:

Attention to means for reducing pedestrian and related injuries, and to reducing severity of those that occur, should have just as high priority as accomplishing the same objective for drivers and passengers.

And this should be implemented, and should have been implemented literally decades ago.

<sup>10</sup> See reference on p. 53.

I know you are giving attention to accomplishing this, especially through the elimination of vertical and horizontal external ridges and protrusions. . . .

As it turned out, I was wrong.

Again quoting:

With the increasing interest of physicians and the general public in this entire problem we expect that many examples of structure-injury relationships, useful to all of us attempting to reduce injury and death on our highways will come to our attention and yours. I am passing along two such examples I hope you will find helpful.

Apparently they were not considered helpful.

And finally, again quoting from part of the letter:

. . . Not all pedestrian injuries can be minimized or eliminated through cleaning up the exteriors of vehicles, either in contour or in hardness of structure in impact areas, but gains can be achieved. For this latter reason, I hope you will find these examples—that I am sending to other companies as well—helpful as you work on the ways in which you should approach this area in the future. If we can be of any help in this respect, I hope you will let me know.

Yet another point is often misunderstood. This is the belief that the safety of occupants demands the crushing of vehicular metal. It has been said that occupants of automobiles equipped with undamageable front and rear ends would be exposed to greater crash forces since the vehicles would have to be rigid enough to crash without damage. If this were so, jet airliners would be unable to land without sustaining damage both to themselves and to passengers from the jolt of touchdown. There are about as many other examples of impact-energy management that effectively and repeatedly keep damage from occurring at low and moderate impact speeds without providing rigid structure that causes damage to humans—modern railroad draft gear that absorbs the shock of coupling freight cars, for instance.

Dr. Patrick M. Miller, head of the Structural Dynamics Section of Cornell Aeronautical Laboratory, Inc., has also forcefully disposed of this point.<sup>11</sup> As you may know, Cornell Aeronautical Laboratory has conducted much of the crash testing and research in this field for the Department of Transportation. Dr. Miller said, and I quote:

. . . (W)e do not see any basic incompatibility between designing vehicle structures for occupant safety and also for property damage reduction.

The contention has been made that the vehicle structure should be weakened so that it will collapse and assist in cushioning the occupants during high speed impacts, where occupant injuries and fatalities generally occur. On the other hand, most people agree that the structure must be strengthened to provide for reduction in vehicle damage. The contention related to the vehicle strength as it affects occupant safety is, I believe, erroneous. Indeed, our work indicates that by strengthening the vehicle structure, both occupant safety and vehicle damage aspects of the problem would be improved.

Even though the vehicle damage problem is associated with low speed, 5 and 10 mile per hour collision, while occupant safety is generally concerned with 20 to 60 mile per hour impact velocity ranges, it may be helpful to briefly review some of the results of the higher speed collisions. . . .

And later in the statement he said:

Thus increasing front structural strength to improve occupant safety in higher speed collision is consistent with a strength increased to reduce vehicle damage in low speed collisions.

A great deal more is involved than simply mounting an improved bumper a few inches in front of the present day vehicle, although even

<sup>11</sup> See reference on p. 53.

this first practical step is decades overdue. What we must also be concerned with is a change in the basic concept of vehicle design to serve the public interest and to remove much of the lethality from the crashes of passenger automobiles on our highways—and much of the dollar cost of their impacts as well.

The Insurance Institute for Highway Safety will continue its testing during the coming months. The committee has asked that we return when we have collected further data from our tests. We will be pleased to comply.

I will be very happy now to answer any questions you might ask.

Senator HART. Thank you very much, Dr. Haddon.

I wouldn't presume to speak for anybody in the audience—it is just my impression that this, your most recent film, is even more devastating an indictment of indifference and shortsightedness on the part, yes, first of the manufacturer, but second of all each of us. Before I blame somebody else, I remember vividly last fall standing on the floor of the showroom at the home office of a principal American auto manufacturer between campaign stops actually and taking the time to go around. I stopped most seriously at one of the vehicles that had one of the most dramatic snouts. Except that it looked a little too young for me, I, by God, would have bought it. And I sense it was largely because of that design. So I was wrong, too.

We are all in a sense, until we are sobered by a thing like this, sharing the guilt.

I had hoped actually, had anticipated that after this fourth meeting over a period of 4 years between you and others of this committee, all these discussions, and the PR pitches, that this would have been a meeting where you described the improvements. You might have been critical of timelag, and so forth. But what you are suggesting—and I notice you draw much harsher word pictures this year than you ever did before, and perhaps that's why I get the impression that what you are showing us is worse, not just a gradual improvement subject to criticism of not enough effort to accelerate still further the improvement—you are in here telling us the damn thing has gotten worse. Now is that what you are telling us?

Dr. HADDON. I think it would be an understatement, Senator, to say that it has gotten any better. And certainly considering the time for correction the situation is, indeed, worse.

Senator HART. Well, we shall hear from those who share with us customers the guilt, the manufacturers.

Dr. HADDON. I agree, incidently, if I may, very strongly with your point that this is not merely dereliction, with respect to people at least, on the part of manufacturers. We live in an environment in which children are not told about the hazards of our time. They are told instead about the bears in the forest and the wolves and Little Red Riding Hood. And I think that one aspect of this is that even people who concern themselves with the environment for the most part don't even see the environment of their own vehicles and the other vehicles about them.

Senator HART. I am glad you underscored it. I made note of the word "environment"—you used it describing one of those vehicles with sword designs and suggested that this was part of our environment, and you are right. The environmentalists don't give that broad a defi-

nition. And when we talk about the environment and what we have to do to fix it—we always think it costs so many billions of dollars that maybe we haven't time left to reverse the deterioration of lands and air and water. We forget that the environment includes what you showed us this morning. I suppose to produce a bumper at a level the same as the bumper on the same manufacturer's vehicle and others without the frill of the Y or the prong or the sword would probably cost less, wouldn't it? I don't know.

Dr. HADDON. I find it difficult to believe that if one wanted to reduce the manufacturing cost of these cars, such as the prow of the Montego, for example, and others, that one couldn't find a way to do it by reducing the amount of junk extended forward. And backward, for that matter.

Senator HART. And that is something that we can do to improve the environment quickly. Unlike the problem of Lake Erie, we can do something about this aspect of environmental damage quickly, if we would.

Dr. HADDON. Yes, although I think that it is pertinent that, as I believe I intended to suggest in part of my statement, each year we slip it is not just a loss for that year in penetrated people and lost property, but rather the entire period is slipped that those vehicles will be on the road, which will be more than a decade. So these designs are not just 1971 designs. They are the American environment in substantial part, the hazards of the American environment, until into the 1980's.

Senator HART. Again reflecting on how those of us who have a responsibility to be aware and think we are doing what our assignment requires but still don't meet it, I came loaded with a list of questions that went to the cost, the \$7 billion of premiums, for example, for the accident crash coverage, the \$3.7 billion-plus for repair costs, and you know the list of questions that would be developed under the business of how you can reduce the damage to property. I came with a couple of questions hoping that you would endorse that aspect of the bill that I filed that asks for a study and evaluation of standards to protect the occupant of the vehicle. But confessedly, I was thinking largely in terms of the dollars that we could save. And only after seeing your film am I reminded again that the first concern should be with respect to life and personal injury.

You raised yourself what is often used as the explanation for the fragility, the delicacy of the structure: That unless the metal ripples, you are going to have very serious consequences to the occupant. You cited, I think, the Cornell report that says this is not necessarily true. But it remains almost an article of faith among those of us who are less informed in the area.

Following either the first or second set of hearings—either in the Committee on Commerce or the Committee on Antitrust, I do not recall which—at which you testified, one of the presidents, at least at that time a president of one of the major American automobile manufacturers rather profoundly reminded us in Detroit that we already have a vehicle, if you want it, that takes care of the problem. You and I and the committee were seemingly being critical of him and his colleagues. He said, "We build tanks here, too." And I remember a newspaper editorial suggesting, "Well, of course, what is wrong with those politicians down there?"

Now are we absolutely sure that the rippling effect which produces the high repair costs can be eliminated, with the result of lesser collision costs and without physical injury increases?

Dr. HADDON. Mr. Chairman, it is important—as the committee's record shows very clearly and, in fact, a good deal of comment from other sources available to the committee shows very clearly—first, that there is a great deal of separation between the speeds at which the overwhelming bulk of the property damage is sustained and the speeds at which injury progressively becomes a problem with higher and higher speed.

Second, within that set of conditions, we are 100 percent positive—and I quoted an independent expert, Dr. Miller from CAL, in my statement—that one can provide effective energy management at low speeds, especially in front- and rear-end collisions, in ways that in no sense are incompatible with protecting people and which, if properly done for many of these vehicles, would improve the protection that is given to those people inside.

Now the question in science, in physics and engineering, is not whether or not one has to absorb energy. One has to absorb energy when something that is moving stops or is stopped. The question, rather, is how do you do it?

You can do it erratically, as you have seen here, by chewing up all sorts of expensive structure, structure that by design is expensive. Or you can do it in a controlled way by energy-managing devices which do not damage any structure.

And in fact, you have also in the record of this hearing—I believe from the October 6, 1969, record; I guess it was in the Senate Antitrust and Monopoly Subcommittee, and I believe you were chairing it, and you implied this earlier—you have not only a written record, a statement, but you also have a movie showing this done with modern devices that are inexpensive and that have been used for many, many years in a number of applications, especially on aircraft landing gear.

You can imagine what would happen if one had to crush sheet metal and perhaps damage occupants every time one put down a light plane or a jet aircraft—if that was how one managed the energy of the vertical jolt, or on an aircraft landing on an aircraft carrier, for example, where they land in a vertical vector at a speed of up to 15 miles an hour and above. In fact, the military specifications for the so-called sink rate that has to be tolerated by military aircraft landing on carriers are somewhere in the vicinity of slightly over, if I recall, 15 miles an hour. So you can imagine what we would have to do as a country, in our military operations or commercial aviation or general aviation, you name it, if each time this happened, to protect people, the only thing we could do would be to chew up a lot of expensive structure. We simply would not tolerate it, and have not tolerated it.

Perhaps this is because the purchasers of aircraft are a bit more sophisticated than the general public, who do not know that it is not necessary to damage the structure.

In addition to that, in the statement from Gerald J. Lynch, the board chairman and president of the Menasco Manufacturing Co.—a leader in shock attenuation devices and the manufacturer of some more than 100,000 military aircraft and other aircraft landing gear systems—as his statement said—October 6, 1969, again, in your record:

Now let us consider cost. The cost of an average installation has one or possibly two principal ingredients; namely, the cost of the shock isolators themselves, and the incremental costs, if any, of integrating the isolator into the vehicle. We estimate that a set of eight shock mounts in volume production would cost approximately \$25 per vehicle, exclusive of selling expense, administrative cost and profit. Our estimate is based on our knowledge of material costs and what we know to be the manufacturing potential of the automotive industry.

I might add, as an aside, that I believe this man was the head for some time of one of the Ford subsidiaries, and he presumably knows what he is talking about.

Again quoting:

Now we cannot estimate the incremental cost, if any, which would be incurred in integrating the bumper system on new model cars. Each manufacturer must identify and evaluate for himself the interacting trade-off decisions with respect to cost, weight, performance, et cetera, in firming up his final design. On the basis of our own understanding of the problem of integration on a specific vehicle, the incremental cost, if any, would not be significant.

As a matter of fact, it is conceivable that design trade-offs could result in a net reduction in the total cost of the vehicle.

And I think that is obvious when you are in this ball park, you could easily take off all of the sculpture you have been seeing in the film and slides.

I hope that answers your question.

Senator HART. I hope this is helpful in correcting the folklore about this thing.

Senator Moss, I know, has questions. So let me raise a couple and then turn to Senator Moss. And then if there is time remaining, we can continue; and if not, we will ask you please to file answers to questions that we will furnish you.

You talked in your statement about the designed-in delicateness—an expression you used several times—designed in delicateness.

Now is the delicateness purposely designed in? Or is it designed in in the sense that the engineers, the automotive engineers just have not paid attention to building cars capable of experiencing low-speed crashes without damage?

Is it thoughtlessness? They just have not thought about the crashes, the repair bills following on after? Or have they thought about it and nonetheless, for some other reason, intentionally designed it in?

Dr. HADDON. Mr. Chairman, I believe that it is entirely accurate to say that the manufacturers of many of these cars are exquisitely expert in estimating exactly what their manufacturing costs are, exactly what stores of replacement parts they must or should or can place in their inventory, and that they are perhaps among the leaders in the world in management expertise of this kind.

I am not interested, nor would I have any way of knowing, whether or not they do this as a matter of deliberation. But I think it should be obvious to us all that they do it knowingly.

Senator HART. Speaking now to your insurance experience, if the delicateness was designed out, how would the insurance companies react? And, specifically, what would be the savings that one could anticipate being passed on to the consumer of insurance?

Dr. HADDON. I should recall first, Mr. Chairman, that I and my organization are not involved in any way in pricing or rating. We are not an insurance association. And frankly, I could not give you an answer to that question.

But I would point out that, as I believe many of us here have seen, there have been advertisements and public statements by several companies that if they only could get a car that could merely sustain no damage at the walking speed of 5 mph, front and rear into a barrier, they would cut their premiums and pass this along directly to the people who purchase their insurance. And I believe the offer has stood now for some time, the various offers, and as yet it still is not met.

Senator HART. If we are determined that we should design out delicateness, or have it designed out for us, I take it there are three ways to go about it:

Have analyses made such as you have made so that each car, when it sits on the floor of a showroom, has a rating on it; and the theory would be that people would buy those cars rated least delicate, and this would encourage the industry to build more cars of that kind.

Or—this would be a variation on it, which is why I asked you the preceding question—tell people how much the delicateness factors will cost them or save them with respect to each of the cars that are offered for sale rather than giving them some sort of an abstract rating of susceptibility to damage of each car. We would tell them that insurance for  $x$  car would cost  $x$  dollars; and for  $y$  car it would cost  $x$ -plus-\$200.

Or, the Government could require certain levels of protection against delicateness; sort of giving a minimum floor of assured protection to the buyer.

Now as you have looked at it, what is the most effective way to eliminate the delicateness? Or should we crank up on all three fronts?

Dr. HADDON. I think you have summarized the alternatives very well, Mr. Chairman. In this hearing, after all, to some extent we are publicly rating automobiles—at least, publicizing their huge variations in susceptibility to damage, and that none of them meet acceptable engineering standards.

As far as your second point is concerned, there is already differential rating by many companies nationwide among the many States on “muscle” cars because of the substantial excess losses associated with the operation of such cars, for whatever reason. And in fact, one hears that this is—although I have not seen any sales figures to support this—one hears that this has substantially blunted the push of some manufacturers to put these cars into the hands of increasing numbers of consumers.

And of course, in the third case, there are opportunities, and I think requirements, for Government in connection with this public problem. I tend to hold the old view that issues which affect all of the people are all of the people's business. And that means, as well, the business of the agency that has been set up to regulate this sort of thing.

So my rather long answer is that I agree with you. I think that all three should be used, in spades; that things are proceeding in that direction; and that a great deal more needs to be done in all three areas.

I would say, however, that I believe that as far as the Federal Government is concerned, it is not the most desirable approach to write into Federal legislation specific performance requirements for bumpers. This would tend to freeze technology. I think that, rather the regu-

latory agency that was set up by the Congress should in fact be the one to be given needed new responsibility for going into all of the technical details, but with a clear forceful indication of intent on the part of the Congress that it means for the agency to move vigorously in the public, rather than the private, interest.

Senator HART. Certainly we better find out from that agency why that build-your-bumpers-at-the-same-level regulation you commented on in your prepared testimony is still being reviewed. I cannot find the place, but you did tell us that several years ago.

Dr. HADDON. I do not recall, Senator, but in any event, I think that it is important—although I did not come prepared to discuss your bill or that filed by Senator Lloyd Bentsen of Texas—I think it is important that authority is needed within the Department of Transportation, clear authority that cannot be argued to the point of delay for years in the courts, for DOT to set standards on the basis of property damage as well as on the basis of reducing injury to people.

Senator HART. Well, when we suggest that we legislate authority for the Department of Transportation to set property standards you caution us not to spell out any particular standard in the legislation less than 10 miles per hour. Is that correct?

Dr. HADDON. That would be considered advisable.

Senator HART. I would predict or anticipate that responses from the industry would run that it either cannot be done, or it can be done but it will cost more than it is worth to get into the business of property. They were reluctant when we proposed to move toward safety standards and now that is accepted; but they would still argue that property loss reduction standards would not be worth the cost, or that "the Government won't give us enough time, leadtime, when they set them."

Now, you have told us that cars can crash at low speeds without sustaining damage. Can we confidently anticipate that if authority is assigned to the Department of Transportation to set property loss reduction standards for automobiles, that it can be done without destroying the esthetics, without major redesign of existing vehicles?

Dr. HADDON. A simple answer is: There is no reason whatsoever to destroy the esthetics. And I believe that, if you can get them on the record, designers for the auto companies will tell you precisely the same thing as they have told others.

I would, if I may, like to add an addendum to an earlier comment. One of the most flagrant bits of misinformation, I think, that has been disseminated by some over recent years was referred to by you earlier, and that is that vehicles, to be safe, have to be like tanks. It simply is not so. In fact, a tank design is a bad design because of its rigidity—because its rigidity in effect transmits the force backward to the people rather than absorbing the energy between the people and the extremities of that particular kind of vehicle.

I just wanted to get that on the record.

Senator HART. I am glad you did.

I hope those editorial writers will read the record, those fellows who wrote that magnificent editorial pointing out how wise the manufacturer was to point out that we had tanks. I hope they read that.

What about cost? Would new energy management systems cost hundreds of dollars? What do you estimate with respect to the cost-bene-

fit ratio? Would any necessary cost increase be offset by savings that would result?

Dr. HADDON. The essential question is how it is done; if it is done properly, it should not.

And again I would refer you to the statement by the head of Menasco to which I referred earlier, and present in the record now, made a year and a half ago.

Senator HART. Have you any idea how long it would take the auto industry to put energy management systems into production?

Dr. HADDON. I suppose the answer to that is the same as the answer to anything else that that industry chooses to do: It depends on how much push it gets behind it.

Senator Moss. Will the Senator yield to me right there?

Senator HART. Yes.

Senator Moss. First of all, let me say that I think your film was excellent. In these days when we read about the large cost of production of some of the epics that are filmed, I think perhaps you have all the records when you put on all those dollar signs on what every one of those crashes cost. But it certainly is dramatic and telling.

Along the line that Senator Hart was just pursuing about the cost of installing energy-absorbing designs on our vehicles, I am reminded that a lot of top executives of the auto industry have recently been making speeches, and they said that the Federal safety, emission, and property loss reduction standards are going to cause cars to cost as much as \$1,000 more by 1980.

Now the staff advises me that in their discussions with the industry executives, this includes an inflation figure of about \$500 [laughter], but I would like to point out that Mr. L. B. Bornhauser, vice president of quality and safety of Chrysler, made a speech recently in Detroit on February 10, and I would like to read a quote from his speech, and then perhaps get your comment on it:

If our industry does not find new ways of meeting the public demand for safer, more reliable, more serviceable vehicles, it could lose the initiative for innovation and change to the regulators, the lawyers and the underwriters. Remember in the 1960's we met the public's demand with the strategy of proliferation; the public wanted greater choice, more variety in models and body styles, two-door and four-door versions of hardtops, coupes and convertibles. It wanted more trim coats, more options and more accessories, from hood scoops, mag wheels and wood-grained steering wheels, to stereo sound systems, electric windows and automatic temperature control. In the 1970's there was a new demand for better quality, for cars that are sure to start and heaters that will always work, especially on mornings like this, for cars that can be maintained and repaired easily and inexpensively, for cars that protect passengers and do not pollute the atmosphere. Our industry met the demands in the 1960's and I am convinced we will meet the demands in the 1970's. But this will take some fundamental change in our product strategies. I think we will see automobile companies reduce the number of models and body styles that they offer. We have already seen all of the manufacturers drop convertible models from most of their lines. I think we will see each manufacturer standardize parts as a way to reduce costs, simplify manufacturing operations, and help solve dealer inventory problems. I think we will see the whole industry move away from the frequent and extreme model changes. Styling and model change will always be a basic part of the automobile industry, but in the 1970's basic product innovations and improvements that make vehicles safer, more reliable and more easily serviced will be even more important.

And that's the end of the quote.

Now do you see this coming about by the automobile manufacturers, this optimistic statement?

Dr. HADDON. Senator, we have all heard optimistic statements before, and I think that the proof of the pudding is in the eating. And a good deal of pudding needs to be eaten to swallow in retrospect some of the statements we have heard.

I would like, if I may, in response—I think it is relevant and it certainly has been widely disseminated—to show you an advertisement which appears in the February 26, 1971, issue of Life magazine.

As you can see, and you may have seen this ad, it is at the top of a two-page spread, and it speaks I think, very interestingly—I expect unwittingly or inadvertently—to this cost issue.

On the one side of the page, the right-hand side, is a picture in outline of what it refers to as the most popular six-passenger car in 1959.

This is an ad placed by Mercury, the Lincoln-Mercury Division of Ford. It says across the top: "Return of the Real Dollar," and the title is: "Mercury Montego's \$2,798 price buys you more car today than 12 years ago." And the 12 years ago was 1959. It gives the 1959 price as \$2,724 and the 1971 six-passenger Mercury Montego price as \$2,798.

Now what else does it say? It says: "The things that make Montego a better value than 12 years ago"—and you remember that there were some pretty expensive materials in the crash films shown in the design of that car—"also make it a better value than any other six-passenger car today."

But what are the things they take credit for? I will just read around each car so I cannot be accused of picking only the ones that fit my point.

First of all, "front tread," and it gives the number of inches. Next, "dual brake system, self-adjusting brakes." At least one of those is required by a Federal standard. I have no doubt that if you check the public record you would find that at the time that every one of these items now required by Federal standards and now claimed—entirely properly—by the manufacturer as something extra that they are providing, you would find, that there were all sorts of objections that these would cost unbelievable sums of extra money which would undoubtedly have to be added on to the price the poor consumer would have to pay.

Then the next item is a "6-cylinder engine." The next item: "wood-grain vinyl paneling on the dash." The next item, "printed electrical circuits in instrument cluster." The next one, "energy-absorbing steering column with locking features"—two required features that were supposed to be so expensive. Next, "head restraints," also federally required. Next, "flow-thru ventilation." Next, "exhaust emission control system"—another Federal requirement, and although I am not familiar with the details of that or the record, I expect there also it was claimed that it was going to cost a great deal. "Bias-belted tires, rear tread, the overall length, and wheelbase."

On the other page, they go through the same items, mentioning, for instance, single brake system. That was before the Federal Government got into the act and required it to be tightened up so if the system failed you would have some chance of stopping with a backup system.

They go on and mention "rigid, nonlocking steering column." They could have been more accurate—it was in fact a spear aimed at the

driver's chest—but they would have scared people to death. "No head restraints, conventional exhaust system," and so forth.

And yet according to this ad, if I read it correctly—and I think I do—a difference of considerably less than \$100 between those two cars over a period of 12 years.

Now obviously, pricing of automobiles and their manufacture is not this simple, but I think this is one testimonial to the fact that these things do not have to cost more, even over a period when there was a good deal of inflation in just about everything.

Senator Moss. I appreciate that answer because of the constant resistance we hear that "this is going to raise the price of automobiles so greatly," "that the consumer will be severely injured." And then, as you point out, when the automobile manufacturer is required by Federal law to do it, he turns it into a virtue by saying, "Look at all these extras we are going to give you." And actually the price of the car, in this instance at least, did not go up. The buyer got all the extras without paying a lot of extra money.

As I interpret your testimony, you believe that there could be adequate designing of energy-absorbing bumpers and exterior parts of the automobile that not only could reduce this dramatic damage that we see there, but could give even improved protection rather than loss of protection to the occupants?

Dr. HADDON. Yes, sir.

Senator Moss. And that the expense would not be exorbitant, would not be anywhere near this \$1,000 per model more that we hear the scare words about?

Dr. HADDON. That is correct. We always seem to hear about the cost of things to be added, but we do not hear about the costs that do not need to be added or that can be taken off.

Senator Moss. One other thing about this standardization that Senator Hart mentioned. Another thing that is often said in criticism, is that a requirement for this kind of protection device would cause cars to look alike, like peas in a pod. Do you think that this is necessary?

Dr. HADDON. No, sir. I think we have had adequately demonstrated to us over a period of 70 years the ingeniousness in styling, granted basic structure, that can be produced in this field.

Senator Moss. I want to ask you one thing about our insurance industry. Your experience in the Highway Safety Bureau has given you great credibility, from what I hear, with the insurance industry, and I just wondered if you know whether action is being taken by the insurance industry, individually or collectively, to establish research repair centers similar to the action taken by the British when they established their research center at Thatcham to control the costs and improving the standards of vehicle repairs?

Dr. HADDON. I cannot give you any complete answer to that, but I have myself visited the Thatcham facility and a number of people within the insurance industry have visited it as well. There have been some discussions—we ourselves would not typically be involved in such discussions.

It certainly offers an interesting example of looking at the process of repair, once damaged, and of finding facts that can be used to force less expensive repair problems.

Senator Moss. So it would be a forward step if this were done in our country; is that correct?

Dr. HADDON. It might be. But I would like to know more about that approach before reaching a definite conclusion.

Senator Moss. Well, thank you. I realize we have extended this hearing over a long time and we have run late into the lunch hour. It is fascinating, and I am sure that this committee will want to continue to pursue with vigor some of the things you have presented to us here this morning.

I appreciate the chairman's allowing me to get those questions in.

Senator HART. I apologize for not turning it over to you earlier, and I appreciate the questions you have asked.

On that business of cost, what would be added? How tough would it be to trim out some of the weaponry, as you describe it, in the front of the car?

I could not stake my life on the preciseness of the figure, but it is in the range of \$2 billion that the American automobile manufacturers spent on tools and dies for the model change of last year, about \$2 billion amortization for special tools and dies used in connection with model changes of that year. So there is money around to produce vehicles which are, as you put it, environmentally compatible and, as other people would say, less fragile and less threatening.

My last point before you leave—and we will ask you to respond to a series of other questions for the record, if you would, in writing—I am reminded of it when you say it is not just this model year that produces the kind of threats to life and the costly property damage. They are with us for as long as that car is on the road, which is for a long time. I feel strongly that the Federal Government has not moved fast enough and tough enough to ensure that there is honest-to-goodness periodic inspection of vehicles on the road.

And here again Michigan, which ought, in this field, to be in the lead, still does not have mandatory automobile inspection, and there are 20-odd other States that do not. Part of it is the experience that some of us have had with sloppy, really worthless kinds of present-day inspection systems.

From your background and experience, what counsel do you give us as to the desirability of annual—"periodic" I guess is a better word—inspection of vehicles?

Now I would throw in even new car inspection to outrage everybody, but at least inspection of used vehicles.

Dr. HADDON. The area needs much attention. As the person substantially responsible for the Federal standards for State governments with respect to vehicle inspection, which is nowhere, as far as I know, being adequately met or completely met, I feel very strongly on the point.

There are aspects, also, of that standard which are simply being neglected—I think that would be the gentle way to put it—I believe, everywhere in the country.

Let me give you a specific example. One of the requirements, as I recall, is that records be kept in inspection stations of the defects, the shortcomings of the vehicles that come through those inspection stations, and these records are to be collected, tabulated and at least annually published by the States so that the public would have the bene-

fit of knowing, as they do, for example, in Sweden, which vehicles have what failure rates on vehicle inspection; and that is simply not being done. It is one of the many consumer issues that is being neglected. There are others.

Senator HART. This goes to protection of life and property?

Dr. HADDON. Yes, sir.

Senator HART. I have found, in leafing through for the fifth time your prepared testimony, the proposed regulation to which I referred earlier. I thought it had to do with bumper levels; and it refers to that side door bar, or whatever you call it—reinforcig side door beam. "A door strength standard was proposed as early as 1967 by the Highway Traffic Safety Administration, but no final action has been taken."

You dramatized the value of that. And I remind us on the committee that we better find out how come the long delay in that.

I was confused; I thought it was the bumpers. Actually the bumper, where you cite a Ford executive engineer saying:

Regardless of other requirements, the front and rear bumpers of a given car line must match at design and curb attitudes with no resultant damage to components.

And when we get that speech as a fact, we will assemble and say "thank you."

There will be other questions directed to you. Thank you very much.

Dr. HADDON. Thank you, Mr. Chairman.

(The questions and the answers thereto follow:)

MARCH 24, 1971.

Dr. WILLIAM HADDON, Jr.,  
*President, Insurance Institute for Highway Safety,*  
*Washington, D.C.*

DEAR DR. HADDON: In order to clarify further the record of the March 10, 1971 hearing before the Senate Commerce Committee, I am submitting the following questions to you and would appreciate your written responses:

1. Do you know if bumper guards could be applied to existing vehicle bumpers which will provide some additional protection to the vehicles now in use?

2. Do you know of any individual insurance company or an industry plan which would assure that the cost savings from energy absorbing bumpers will be passed along to the insurer?

3. Have you made any projections as to the potential savings less delicate cars would afford to the motoring public?

4. Do these projections take into account possible cost increases in vehicle manufacturing that may be passed on to the consumer?

5. Do these projections take into account the savings resulting from the potential reduction of damage of speeds in excess of those for which energy management systems are designed?

6. In your statement you say that 94% of certain property damage claim closures were for \$500 or less.

a. Approximately what range of crash speeds are likely to produce \$500 of pay out by insurance companies?

b. Is it possible to determine accident frequency at various precise impact speeds in order to ascertain the speeds at which the bulk of our "Fender-bender" accidents are occurring?

7. In your testimony you take issue with General Motors' position on frequency statistics in front-end collisions as compared to rear-end collisions. At pages 25, 26 and 27 you discuss your findings as compared with GM. Can you provide the Committee with the details of your findings, including statistical bases for such findings?

8. How can property loss reduction standards reduce pedestrian injury?

9. Does the Secretary under current law have the authority to issue standards which would afford pedestrian protection from the kinds of designs you have described in your testimony?

10. The evidence before the Antitrust Subcommittee clearly establishes that as a minimum about  $\frac{1}{3}$  of the general repairs are improperly done for a number of reasons, not the least of which is the inability of many of the mechanics to correctly perform the repairs they undertake. Now it seems to me that  $\frac{1}{3}$  of the general routine repairs are unsatisfactory, and an even larger number of the more difficult crash repairs are probably unsatisfactory and indeed possible grossly unsafe. It was for this reason we included in this bill a provision requiring inspection after vehicles are involved in crashes which damage safety related mechanisms. Here again it seems to me that the insurance industry's own interest can be served by such post crash inspections. First, you would know that you got qualified repairs for the money you paid; and secondly, you can be sure that the repaired vehicle would not again be involved in a subsequent accident due to faulty repairs.

Does the insurance industry have any estimate of the relative cost benefit ratios for inspections as that might result in a savings by preventing accidents?

11. The life insurance people make an effort to determine the condition of the people they write life insurance on. Yet under the present system of auto insurance there appears to be a lack of concern by the industry about the condition of the vehicles they insure.

Is the insurance industry making any effort to determine if the mechanical condition of vehicles is a positive factor in accidents?

12. This bill provides for inspection at the time of transfer of title. Wouldn't such a provision guarantee that the vehicles insured would at least meet minimal safety requirements?

Thank you very much. The Committee certainly appreciated your March 10th testimony.

Sincerely yours,

WARREN G. MAGNUSON,  
*Chairman.*

INSURANCE INSTITUTE FOR HIGHWAY SAFETY,  
Washington, D.C., April 30, 1971.

The Hon. WARREN G. MAGNUSON,  
*Chairman, Senate Commerce Committee,*  
*U.S. Senate, Washington, D.C.*

MY DEAR SENATOR MAGNUSON: This is in response to your March 24 queries. I regret that I have been delayed in answering by heavy travel since.

1. As indicated by the films and test results shown to the Committee and as discussed in my testimony, the vertical bar-type "bumper guards" such as those now found regularly on some cars seem to provide no additional protection, and may indeed be aggravating damage in at least some types of low-speed crashes.

2. According to press and advertising copy, a number of companies are offering collision insurance premium reductions for vehicles whose manufacturers have provided front- and rear-end damage protection systems capable of eliminating barrier-impact damage at speeds even as low as five miles per hour. Details of such offerings would be available from either the trade associations representing those companies or from the companies themselves.

3., 4., & 5. No manufacturer has made public the extent to which vehicles sales' price and manufacturing costs are now unnecessarily inflated by sheet metal and other sculpture placed in proximity to both front and rear bumpers, or the extent to which this will be true in case of the design planned for future years. In addition, no manufacturer has made public the extent to which sales of new cars are inflated because the designed-in delicateness of contemporary cars unnecessarily makes many cars involved in low-speed crashes a "total loss." Nor has any manufacturer publicly indicated its manufacturing costs and the amount, if any, that it intends to further increase its vehicles' sales prices because of the addition of low-speed energy-managing, no-damage front- and rear-end design. Thus, we are making no projections in this area at present. However, as noted in my response to a question by Senator Hart during the March 10 hearing, it may well be that damage resistant front- and rear-end car design can be made available to the public at no increase in vehicle sales prices, or at a reduction in price. Savings produced by eliminating costly sheet metal sculpture could quite likely more than offset the cost of equipping automobiles with bumper designs that effectively manage energy—without damage—in such low-speed crashes as those at five, ten, and fifteen miles per hour.

6. a. and b. Since the research in this field has not yet determined with sufficient precision the frequencies and interrelationships between such factors as the various real-world crash configuration, speeds of impact, and objects striking or struck, a precise answer is not yet possible. Such research is possible, though pesky in design and execution. However, as our findings presented in the March 10 and prior hearings indicate, present cars are so delicate that 10 miles per hour car-into-barrier and front-to-rear car-to-car crashes commonly produce amounts of damage in excess of \$500.

7. A survey was conducted by Allstate Insurance Company of all claim files closed during February, 1970, involving a claim under property damage liability or auto collision coverages. Approximately 13,000 claims of each type were surveyed. The Institute obtained its data from these surveys. These were the basis for the statements concerning the frequency statistics in front- and rear-end collisions.

Each claim in the survey involving damage to an automobile had the collision impact point coded, using a coding system based on the 12 numbers of a clock face. For example, a direct rear-end impact was coded as "6", a direct front-end impact was coded as "12", codes "5" and "7" represented off-center rear-end impacts and codes "11" and "1" represented off-center front-end impacts.

To obtain the impact frequencies for rear-end impacts, the number of claims with impact codes "5", "6" and "7" were summed and then divided by the total number of claims. Similarly, for front-end impacts the number of claims with impact codes "11", "12" and "1" were summed and then divided by the total number of claims.

Front- and rear-end impact frequencies were obtained, as described above, separately for property damage liability coverage and collision coverage claims. For property damage liability coverage claims the frequency of rear-end impacts was 45.6 percent and the frequency of front-end impact was 28.9 percent. For collision coverage claims, the frequency of rear-end impacts was 21.7 percent and the frequency of front-end impacts was 56.4 percent. Combining the two sets of results produced a ratio of front-end impact to rear-end impacts of 1.26:1.

8. The short answer is: by eliminating designed-in features of car exteriors that produce both unnecessary dollar losses *and* unnecessary pedestrian injuries, i.e., pointed, sharp, spear-headed and other force-localizing configurations. The detailed basis for our answer is contained in my direct testimony and in the question and answer portion of the March 10 hearing. I note also that placing the bottom of the bumper too high can force small children downward under the car, and that hardness of striking surface also increases injury unnecessarily.

9. Yes!

"The committee was likewise made aware of the substantial needless hazards to pedestrians presented by external fins, ornamental protrusions, sharp edges, stylistically angled bumpers. . . .

"Thus the bill is intended to reach not only the safety of driver, passenger, *and pedestrian* (emphasis added), but the safety of those who must work with or otherwise come in contact with the vehicle while it is not operating." (Committee Report on Traffic and Motor Vehicle Safety Act of 1966, Senate Committee on Commerce, Calendar No. 1271, Report No. 1301, June 23, 1966.)

10., & 11. These questions should be addressed to the trade associations representing the insurance industry. This Institute has not developed data on car repair quality or the cost benefits of vehicle inspections. Incidentally, I would point out that inspections such as you describe, if performed, should be directed at seeing to it not only that vehicle-caused accidents are prevented in the future, but also that vehicle features intended to protect people and their property *in crashes which do occur* have been restored to original operating condition.

12. This would depend on the type and quality of any such inspection. Such questions have been extensively discussed in "Safety for Motor Vehicles in Use," a report by the Secretary of Transportation to the Senate, June 1968, pursuant to requirements of Section 108(b)(1) of Title I of the National Traffic and Motor Vehicle Safety Act of 1966 (Document No. 103, GPO Catalog No. 90, available for \$.50).

Sincerely,

WILLIAM HADDON, Jr., M.D.,  
President.

Senator HART. We will adjourn, subject to the call of the Chair.  
(Whereupon, at 12:50 p.m., the committee was adjourned, subject to the call of the Chair.)

This car met requirements of the U.S. Department of Transportation's standard for rear bumpers on 1973 model cars, and yet suffered \$64 in property damage in this crash test.

(The following information was subsequently received for the record:)

MAY 27, 1971.

Dr. WILLIAM HADDON, Jr.  
President, Insurance Institute for Highway Safety,  
The Watergate, Washington, D.C.

DEAR DR. HADDON: As a follow-up to your testimony before the Senate Commerce Committee on May 12, 1971, could you please provide the Committee with the following:

(1) an itemized parts and labor list for each car which you crashed during the 1971 crash test series and

(2) any data you have on the effect of crash repair parts increases on the overall crash repair cost increase between 1970 and 1971.

In addition, while I realize the Insurance Institute for Highway Safety did not test cars to determine their compliance with the Department of Transportation's 5 mile per hour front-end barrier test, could you provide the Committee with any information you have as to whether vehicles, if any, might meet the 5 mile per hour front barrier test being proposed by the Department of Transportation.

Thanking you in advance for your consideration of this request, I am

Sincerely yours,

WARREN G. MAGNUSON,  
Chairman.

INSURANCE INSTITUTE FOR HIGHWAY SAFETY,  
Washington, D.C. June 7, 1971.

Hon. WARREN MAGNUSON,  
Chairman, Committee on Commerce, U.S. Senate,  
Old Senate Office Building, Washington, D.C.

DEAR SENATOR MAGNUSON: The following are responses to follow-up questions contained in your letter of May 27.

1. The itemized list of parts and labor for each car which was test crashed during our 1971 crash test series is being sent under separate cover.

2. A portion of the increase in estimated repair costs for the 1971 model sedans over the similar 1970 model sedans test crashed a year ago can be attributed to increased parts costs. For instance, among the four popular model sedans—the Chevrolet Impala, Ford Galaxie, Plymouth Fury and American Motors Ambassador—the price of the 1971 model's bumper face bars, front and rear, increased from 4 to 13 per cent over the price of the similar part on 1970 models. I might point out that the low of 4 per cent was for the rear bumper of the Ambassador and that the high of 13 per cent was for the Impala front bumper face bar. In all other cases but these, the increase in price for the bumper face bars ranged between 5 and 10 per cent. One other case is also noteworthy: the American Motors Ambassador's 1971 model features what are called "bumper guards," protruding chrome noses on the front bumper which are faced with rubber; while the replacement bumper itself is priced at \$62.95 as opposed to the 1970 replacement bumper's price of \$59.25—a 6.25 per cent increase—this does not include the bumper guards, which are priced at \$24.80. Following is a chart showing the 1970-71 model price difference of front and rear bumpers for sedans.

1970-71 DIFFERENCE IN SEDAN REPLACEMENT BUMPER PRICES

	1970	1971	Dollar difference	Percent difference
Chevrolet Impala:				
Front.....	\$61.75 <sup>1</sup>	\$69.95	\$8.20	13
Rear.....	47.50	52.25	4.75	10
Ford Galaxie:				
Front.....	64.95	69.45	4.50	7
Rear.....	59.20	63.30	4.10	6.95
Plymouth Fury:				
Front.....	58.25	61.15	2.90	5
Rear.....	65.00	71.95	6.95	10.5
American Ambassador:				
Front.....	59.25	62.95 <sup>2</sup>	3.70	6.25
Rear.....	61.35	63.80	2.45	4

<sup>1</sup> On 1970 models, the Chevrolet Impala front bumper was in 2 sections, priced \$46.25 and \$15.50, for a total \$61.75.

<sup>2</sup> On 1971 models, the front bumper is also equipped with bumper guards, priced at \$24.80 per bumper. This brings the total front bumper price to \$87.75, or 48.7 percent above the 1970 front bumper price of \$59.25.

We have also made an attempt to adjust the 1970 model sedan estimated repair costs upward to reflect inflation in crash replacement parts, to determine how much of the increase in the total estimated repair cost for 1971 models is attributable solely to the increased delicateness in the front and rear end designs of the 1971 models. We adjusted the 1970 model replacement parts costs upward by 4.5 per cent, the rate of inflation in the wholesale price index from the start of the 1970 model year (September 1969) to the start of the 1971 model year (September 1970). The following are charts showing these comparisons:

	1970 models			1971 models			Percent increase		
	Parts <sup>1</sup>	Labor <sup>2</sup>	Total	Parts	Labor	Total	Parts	Labor	Total
<b>5 m.p.h. front barrier:</b>									
Impala.....	95.30	120.00	215.30	196.70	171.20	367.90	106.4	42.7	70.9

<sup>1</sup> Parts inflated by 4.5 percent, Bureau of Labor Statistics (inflation of wholesale price index from September 1969 to September 1970).

<sup>2</sup> Labor, \$8 per hour.

<sup>3</sup> In the front-to-rear crashes, the price listed 1st for each car model is the estimated repair cost for the striking car (front-end damage); listed 2d is the estimated repair cost for the struck car (rear-end damage).

<sup>4</sup> In the front-to-side crashes, the price listed 1st for each model is the estimated repair cost for the striking car (front-end damage); listed 2d is the estimated repair cost for the struck car (side damage).

As can readily be seen, the four sedan models tested each year averaged a 41.5 per cent increase in their 5 mile per hour front-into-barrier crash tests in 1971, even after the 1970 test results were adjusted for both labor and parts inflation. Similarly:

For the 5 mile per hour rear-into-barrier crashes, a 36.6 per cent average increase in 1971;

In the 10 mile per hour front-into-barrier tests, a 26.4 per cent average increase;

In the 15 mile per hour front-into-barrier tests, a 43.1 per cent average increase.

These increase levels, we believe, are the results of increased delicateness designed and built into the four sedan models we tested.

The 1973 standard for front ends requires that a limited number of certain items of equipment be functional after five miles-per-hour, front-end, barrier impacts. These include the hood latch, cooling system, fuel system, and lights. Since in our tests (prior to the issuance of the Department of Transportation standard) of 1969-71 model cars using the same kind of five miles-per-hour front-end, barrier crashes as the 1973 standard requires, we were documenting property damage and not specifically and directly post-crash inability of such items to function, we cannot give an answer with respect to the front ends based on examinations of such functional ability. Nonetheless we can exclude some cars as being unable to meet the standard since retrospective examination of our crash photography and parts-damaged lists indicated such experience as broken headlights, leaking radiators, and damaged hood latches.

In the case of other cars front-ended at five miles-per-hour, there is no evidence from inspection of our photography and of the lists of parts damaged that the items specified by the front-end, 1973 standard were damaged. (I note, incidentally, that an additional complexity stems from the fact that as long as the headlights, even if knocked out of position, can be adjusted back to their originally allowable alignment, they still pass the DOT standard. Needless to say, we had also not checked for such alignment. This permissiveness, by the way, is another deficiency of the standard as issued.)

In the context of the foregoing, any conclusions on the basis of our tests as to the extent to which cars now on the road would pass the front-end 1973 standard must be a matter of carefully considered judgment, not certainty, and it is for this reason that we concentrated in my testimony on the rear end, where headlight alignment problems and most of the others cited above present no problem.

Nevertheless, our best judgment is that substantial percentages of 1971's would in fact pass the 1973 *front-end* standard and that the percentage of 1971's in this category may be approximately one-third of make-model varieties we tested.

The additional question arises as to whether there are individual kinds of cars that now pass the 1973 standard at *both* ends.

Some cars that pass the standard at one end (either) do not at the other. This appears to substantially reduce the one-third figure given above. However, others almost certainly pass at both ends and this most probably includes prominent varieties of 1971 automobiles.

The following four 1971 automobiles appear to have met the 1973 DOT bumper requirement after a five miles-per-hour front-barrier crash. They did not sustain damage to the hood latches, radiators, fuel systems, or lights, although headlight alignment was not checked.

Make-model :	Damage
Ford Pinto.....	\$164. 20
Chevrolet Vega.....	181. 30
AMC Gremlin.....	121. 30
Mercedes 220.....	194. 50

The remainder of the nine 1971 automobiles sustained damage to radiators or hood latches, and in one instance sustained damage in such a way that although the latch operated satisfactorily, the hood could not be fully opened.

It is interesting to note that both the Pinto and Mercedes 220 also passed the 1973 requirement for a 2½ miles-per-hour rear-barrier crash.

If we can be of further help, kindly let me know.

Sincerely,

WILLIAM HADDON, Jr., M.D.,  
President.

## AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

THURSDAY, MARCH 18, 1971

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
*Washington, D.C.*

The committee met, pursuant to notice, at 10 a.m., in room 5110, New Senate Office Building, Hon. Warren G. Magnuson (chairman of the committee) presiding.

Present: Senators Magnuson, Hartke, Hart, Moss, Cotton, Baker, Cook, and Stevens.

### OPENING STATEMENT BY THE CHAIRMAN

The CHAIRMAN. The committee will come to order.

There will be some other Senators on their way. The committee feels this is a very important meeting.

The Chair has a short opening statement.

Today the Senate Commerce Committee will receive the final report and recommendations of Secretary Volpe<sup>1</sup> based upon a comprehensive 2-year study of the automobile compensation system which we commissioned. It is my hope that the report and recommendations will complement the efforts of this committee and the Congress to achieve meaningful reform in automobile insurance practices and procedures.

I need not elaborate on the automobile insurance problems facing every family in this country. I have often said the two most important things to any American family are health insurance and automobile insurance.

I need not restate my own personal commitment to achieving meaningful changes in our present system—changes that will erase the symptoms of unavailability, arbitrary cancellation, and spiraling costs by curing the sickness which produces these symptoms.

Speculation concerning the administration's position on this important matter has been great. I have seen every conceivable position reported. I do not know where the information came from but the papers always say it is "an informed source."

Senator Hart and I—and I do not speak for the other members of the committee—have made our position quite clear because we have been in this matter for a long time and we have come to the conclusion that a national no-fault approach is needed and we think it is needed now. We are going to hear what the Secretary has to say about that.

<sup>1</sup> See p. 145.

Now, Mr. Secretary, before we do that, before we begin the questioning and hear from you, I think I could speak for every member of the committee when I express our appreciation for the way you and your staff have conducted this auto compensation study. You, Assistant Secretary Baker, Mr. Richard Walsh and Mr. Lee Huff are to be complimented. It has been a long, complex, most difficult task. I hope that you know that we are deeply appreciative of the way you have joined with us in trying to work out something.

Now, before you begin, as I understand, there are copies of the final report available. You can see the interest in this. Will there be copies available for people through the Department?

Secretary VOLPE. Yes, sir.

The CHAIRMAN. They are already printed?

Secretary VOLPE. Yes, sir.

The CHAIRMAN. Thank you.

**STATEMENT OF HON. JOHN A. VOLPE, SECRETARY, DEPARTMENT OF TRANSPORTATION; ACCOMPANIED BY RICHARD WALSH, DEPUTY DIRECTOR FOR POLICY AND PLANS DEVELOPMENT; CHARLES D. BAKER, ASSISTANT SECRETARY FOR POLICY AND INTERNATIONAL AFFAIRS; AND LEE W. HUFF, DIRECTOR FOR POLICY AND PLANS DEVELOPMENT**

Secretary VOLPE. Mr. Chairman and members of the committee: May I first present my colleagues? Charles Baker, my Assistant Secretary for Policy and International Affairs. To his right Lee Huff, Director of Plans for the Insurance Study. And to my left Dick Walsh who was Director of Operations for this very important study.

I am certainly very happy to be here today to discuss the final report of the Automobile Insurance and Compensation study called for by Public Law 90-313.

Last fall when I appeared before this committee I noted that the research findings of the study were largely contained in a series of published reports which now number 23. Our policy findings and recommendations are included in the report we are releasing today. This report summarizes the principal factual and judgmental findings of the study, analyzes the basic alternatives to the present system, and makes a tentative judgment as to what should be done by way of change in the future and how that change should be accomplished.

I see no point in dwelling here on the problems and disabilities of the present system. I described our own views generally last October before this committee and they are detailed in the various reports of the study. Moreover, there appears to be a very broad and heartening consensus among nearly everyone concerned—the industry, many elements of the bar, consumer spokesmen, insurance regulators, and legislators and executives at all levels of government—that the present system is not working well and should be changed.

Nor will I attempt to assess here the relative merits of all the various reform plans that have been offered as alternatives to the present system. In this thicket there is plainly much less of a consensus; the complexity of the subject and its problems make possible

an almost limitless number of combinations, permutations, and variations of recovery rules, insurance coverages, et cetera. Our report, without trying to be exhaustive, discusses the broad range of the principal alternatives and some of the advantages and disadvantages of each. I am certain that these hearings will do much to draw out the merits of the various approaches.

What I would like to address myself to this morning are the recommendations contained in this report. A number of rather important considerations or judgments have influenced the framing of these recommendations.

First, it seems clear, at least to us, that there remains much legitimate uncertainty about how far and how fast the public wants or is willing to go in changing the reparations system. It is also clear that there exists genuine and warranted concern as to the unknown and essentially unknowable price and cost implications of any major change in the system, which of course would ultimately affect the cost and quality of service to consumers of insurance. Regulators and other responsible public officials would appear to share these feelings. We, ourselves, don't claim to have definitive answers to these questions either. As a result, it seems to us that we should seek change through State action but consistent with the broad outlines or principles of a system such as that described below. We need not and do not insist that a single reform system be imposed upon all the States. The experience of the States should have much to tell us about the most desirable final configuration of the motor vehicle reparations system.

Nonetheless, because motor vehicle travel is so much an interstate activity, States should eventually attempt to develop similar reparations systems. While we find great intrinsic merit in the State system of insurance regulation and in ultimate State control of decisions regarding their own reparations systems, some kind of broad national goals or standards, which are advisory, would seem to be very useful and appropriate.

Further, change in the auto accident reparations system at the State level has clearly moved off dead center and would appear to be achieving some momentum. I could not have made that statement a year ago. I think that this constructive move should be strongly encouraged, perhaps guided and helped, *but not* preempted by Federal action.

With those remarks, let me turn to the recommendations themselves.

#### SUMMARY OF THE RECOMMENDATIONS

We believe that the States should *begin promptly* to shift to a first party, non-fault compensation system for automobile accident victims.

We believe that this can be done in such a way that we can reverse ourselves, if the actual performance of the system doesn't meet our expectations.

We believe that recovery for general or intangible damages should be drastically limited and carefully circumscribed.

We believe that our relevant institutions, public and private, and the citizens who man them, should be given adequate time to plan for, adapt to and assess the performance of a new system.

We believe that the change should take place at the State level but

that there should be general national goals or principles toward which the States will be moving.

It is proposed that all medical and rehabilitation costs be made recoverable from the victims' own auto insurers on a first-party non-fault basis. Coincident with this change could be a restriction on the recovery of general damages to cases involving death, permanent impairment or disfigurement, or total medical costs exceeding a rather high threshold. Victims could continue to recover other personal injury economic losses and property damage losses under the existing system. Later, the rest of personal injury-related economic loss compensation could be shifted to a first-party, non-fault basis.

Finally, there is the question of a shift of some or all of the property damage loss compensation now being made under third-party fault rules to a first-party, non-fault basis. Whether, when and to what extent this should take place should depend upon the public's reaction to no-fault accident compensation for personal injury, the development of a reasonably sound system for rating the relative damageability and repairability of motor vehicles, and the achievement of broad understanding of the inherent "fairness" of using loss exposure as a major factor in pricing insurance to the individual. The more serious and immediate problems and the greater opportunity for cost savings seem to be in the personal injury field.

We agree on the direction we should be heading and that meaningful change should not be delayed. While hopefully many States should be taking the direction on their own accord, we would propose at the same time that the Council of State Governments through its appropriate instrumentalities, give added impetus to such steps.

It is possible that further consideration of the matter by the Congress, the States and the industry may dictate that the implementation process should be broken down into several stages. We are not doctrinaire on this point, only on the general direction in which we should be heading and on the point that meaningful change should not be unnecessarily delayed.

We hope that there would be a minimum of argument over whether full implementation would or would not result in cost savings to the public. We simply cannot predict the absolute long-range financial impacts of such a fundamental change with any reasonable precision, nor should we allow ourselves to be unduly distracted by those who wish to argue the question one way or the other. As various first-party no-fault plans are implemented in different States answers will be forthcoming to the question of whether some variant of the program we suggest works better than the present system or not. In this manner, States may be able to spare themselves most of the uncertainty, and greatly reduce the financial risk that would be involved in any single step, all the way, perhaps irreversible change of the system. A first step, for example, might be designed to give confidence that the added costs of insuring full medical coverage to all victims will be offset by the "savings" achieved by revising the rules on general damages. Thus, reform as proposed might allow systems to absorb changes in digestible and reasonably predictable amounts and allow them to reverse gears or slow down, or perhaps even speed up, as experience indicates.

Let me describe more specifically the broad outlines of a possible ultimate system which we believe is consistent with the findings and conclusions of our study and the principles we endorse. The policy limits and deductibles I will use should be recognized for what they are—illustrative. (Our study findings do indicate that they are in appropriate orders of magnitude.)

#### AN ILLUSTRATIVE SYSTEM

We believe that the present system needs change badly, and needs it now. Based on our extensive study, we believe that the most promising avenue for changes which will better serve the driving public is in the direction of a first-party no-fault system, combined with modification of the rule on general damages. More specifically, we think that a system like the one described below shows the most promise. But a little observation is worth a great deal of speculation. Only last January 1 did Massachusetts, my home State, become the first State to take a step toward the system we recommend.

By the way, anybody who thinks that can happen overnight in any State just has not looked at the facts because it was over five and a half years ago that the gentleman testifying before you today started trying to change the law in Massachusetts, and it was the middle of last year, approximately, when my State was finally able to get it changed.

Other States may follow, and they should. Only out of States' experience with variants of the kind of plan we recommend will we be able to learn with assurance which first-party, no-fault plan is best. If the new plan fulfills our expectations, it should become as dominant in the States as third-party fault plans are today.

#### COMPULSORY FIRST-PARTY BENEFITS

Every owner of a motor vehicle would be required to carry insurance protecting himself, his family, and every uninsured passenger or pedestrian suffering injury as a result of an accident involving the insured vehicle for all economic losses they thereby incur, subject to reasonable limits and deductibles. In addition, the insurance should protect the insured and all members of his family who are part of the same household against losses suffered when they are pedestrians, or passengers in another vehicle.

#### REQUIRED MEDICAL BENEFITS

Full coverage for all medical benefits should be provided with a relatively small permissible deductible per accident but with very high mandatory limits. Any deductible or limit voluntarily assumed by the car owner on behalf of himself and his household would not apply, however, to the medical losses of uninsured pedestrians. Included in covered benefits will be all medical rehabilitation expenses within the limits provided. Coverage should be primary as among private systems—that is, payment of benefits by a carrier under this coverage should automatically remove the obligation of any other insurance

carrier to pay benefits to the extent that the costs are covered by automobile insurance. However, there should be the greatest freedom open to the insured in selecting his choice of coverage.

#### INCOME LOSS PROTECTION

Coverage would have to be afforded for a relatively high percentage of earned income of the injured or deceased auto accident victim. There should be a short permitted waiting period at the option of the insured for the start of benefits, and a permitted monthly benefit ceiling by the insurer of perhaps \$1,000. Voluntarily assumed deductibles or limits would not apply to uninsured pedestrians. Higher benefits could be made available at the option of the insurer and insured.

This coverage might pay wage continuation benefits any time an injured person is prevented from working, either as a result of his disability or as a result of his participation in an approved rehabilitation program. The benefit program should provide for modification as provided contractually between the insurer and insured because of changed circumstances, for example, the remarriage of a surviving spouse, surviving children reaching their majority, et cetera.

The minimum duration of mandatory income loss protection should, and probably could, be finally established only after some further investigation and experimentation. Initially, minimum duration might be set at 3 years, except for victims in approved rehabilitation programs whose protection would continue as long as necessary. Longer durations should be optionally available from the beginning and should also be considered for inclusion in the mandatory coverage as experience dictates. A lump sum burial benefit of perhaps \$1,000 per person could be provided, with any higher benefits being optional on the part of both the insurer and the insured.

#### LOST SERVICE BENEFITS

Coverage for the cost of necessary replacement services for non-employed persons (for example, housewives) could be required up to a benefit of perhaps \$75 per week, although I think my wife is worth more than that, with a permitted waiting period for benefits at the option of the insured. Minimum duration of mandatory protection might be the same as for income loss.

#### PROPERTY DAMAGE

Coverage of damages to property, including the insured vehicle, might be required, but with a permissible deductible referable to the vehicle only at the option of the insured of up to a rather high level, perhaps \$1,000 or a third of the value of the car, and with a permissible limitation of coverage by the insurer of \$10,000 per accident. There would be no deductible with respect to the nonvehicular property of others damaged in an accident.

#### ELIMINATION OF ACTION FOR DAMAGES

No recovery for any loss covered by the applicable required coverage would be permitted in any private action for damages. The insured victim's sole recourse for benefits for wage loss, medical loss, lost serv-

ices, funeral expenses (and property damage) should be limited to the insured's required coverage and any additional optional coverages that he has elected to purchase, whether under an auto insurance policy or other voluntary loss reparation program.

The existing right to sue for damages resulting from negligence in car crashes might be drastically curtailed, perhaps remaining only for intangible losses subject to a limitation: No person should recover for intangible losses unless he established that he suffered permanent impairment or loss of function or permanent disfigurement, or that he incurred personal medical expenses (excluding hospital expenses) as a result of the accident in excess of a rather high-dollar threshold. The dollar threshold initially chosen should not be considered inviolable but should be reviewed as to its appropriateness as regular, specified intervals.

Drivers could, of course, continue to insure against this residual third-party liability.

#### WHERE DO WE GO FROM HERE?

The Department's study is now completed; you have our final report and our best judgment as of this point in time as to the kind of a reparations system which is most promising for the future. As I said, we think the present system needs change badly and needs it now.

What we would hope to see now is for the Congress, after listening to the views of the other interested parties, to enact a concurrent resolution setting forth the principles of a reparations system toward which the State should strive. These principles or goals would give guidance, direction, and impetus to the States' own reform efforts. We have gone as far as we can without observance of actual experience. Now is the time for the States to act, and we will help them. We have completed our study; now let us implement it.

Both the Congress and the executive branch should measure the States' progress toward these goals over a reasonable period of time. The Department of Transportation should maintain a program of continuing surveillance of the matter, and provide direct cooperation and assistance to the State. Two years from now, when we have had time to analyze the experience of the several States under new systems, there should be a reexamination of the whole question of auto accident compensation reform and whether or not some further action is desirable.

We have prepared a draft concurrent resolution along these lines, and today I have formally submitted this proposed resolution to the President of the Senate and Speaker of the House for the consideration of the Congress. If such resolution is passed, we would look for the 50 States (and four other districts) to undertake introduction of systems along the general lines we suggest. We will assist both the States and instrumentalities of the States in this effort. In addition to ensuring that the ultimate development of the system is brought about by those who we believe can do it best, the States themselves, this ensures the opportunity for full nationwide participation in such development.

Mr. Chairman, when I was last before you on this subject, I observed that the problem of motor-vehicle compensation is far more complex and far less easily resolved than many appear to believe. This, ob-

viously, has not changed in the last 6 months. But complexity, difficulty, or whatever, should no longer stand in the way of action. This administration and I want to cooperate with and support those who also want to get on with the process of reform.

Mr. Chairman, this completes my prepared testimony. We will be happy to answer any questions you or the other members may have.

I have here the proposed concurrent resolution, which I can read if you desire. Each of you have a copy and you may prefer that it be added to the record. I will be guided by your preference, Mr. Chairman.

The CHAIRMAN. Thank you, Mr. Secretary.

We will put the concurrent resolution in the record here in full and it will probably be referred to this committee when we meet tomorrow. So we will have that before us and also the bills that have been introduced, mainly the main bill which has been before this committee for some time, and there are some other bills. So we will have before us the opportunity to look at all of these proposals and that is what the committee intends to do.

(The concurrent resolution follows:)

#### CONCURRENT RESOLUTION

Whereas the existing system for compensating motor accident victims results in the unavailability of any benefits to many persons sustaining loss arising out of motor vehicle accidents, including many seriously injured persons and the dependents of many persons killed in such accidents; and

Whereas the existing system's uneven allocation of compensation benefits results in the excessive compensation of many persons sustaining only minor loss, and whereas by contrast many persons with severe and permanently crippling injuries recover only a fraction of their losses in compensation benefits from the system; and

Whereas administration of the system consumes an inordinate amount of resources which might be put to better use in compensating accident victims; and

Whereas the system's benefits tend to be ill-timed and unresponsive to victims' needs both because of long delays in payment and because benefits are predominantly in the form of lump sum payments, and whereas effective rehabilitation of the accident victim tends to be a practical impossibility under the system; and

Whereas the system is supported by, and dependent upon, compulsory insurance or financial responsibility laws which exert varying degrees of compulsion upon motorists to purchase liability insurance without invariably assuring motorists of the availability of automobile insurance; and

Whereas the counterproductive regulatory pressures placed by the system on insurers has led to the development of socially undesirable competition in risk selection accompanied by arbitrary and capricious declinations of insurance, cancellations and refusals of renewal with the consequent growth of a high-risk automobile insurance market serviced in some cases by insurers of questionable financial stability; and

Whereas the system has imposed intolerable burdens on State officials responsible for regulating the rating, underwriting and claims practices of insurers and responding to consumer complaints relating thereto; and

Whereas the system has placed an unreasonable workload on the Federal and State courts which have been forced to devote a disproportionate part of their time and resources to motor vehicle accident civil litigation; and

Whereas the system has resulted in the denial of substantial and equal justice to seriously injured accident victims who are unable to withstand the financial burdens consequent upon long court delays and who are, therefore, forced into inadequate settlements of their claims; and

Whereas the existing liability insurance system renders it impossible rationally to allocate insurance premium costs so as to reflect the ability of a motor vehicle to protect its occupants from serious injury in the event of a crash or to reflect differing costs of repairing motor vehicles; and

Whereas, however, prompted by the Automobile Insurance and Accident Insurance Study mandated by Congress, the Hearings of Congressional committees and the various hearings and studies conducted by many State legislatures, it is now almost universally conceded that there is an imperative need for prompt and far-reaching reform; and

Whereas one State, the Commonwealth of Massachusetts, has taken the lead by enacting the first partial no-fault plan in the country and many of the State legislatures are even now considering far-reaching reforms suited to the needs of their constituencies; and

Whereas the principal problems and abuses with respect to automobile insurance clearly stem from defects in the system for compensating accident victims and from the compulsions upon motorists to obtain the insurance which sustains and upholds that system rather than from defects in the insurance institution or in its regulation by the several States; and

Whereas assumption of the present comprehensive State regulatory authority over automobile insurance by the Federal Government would be fraught with great and grave consequences giving rise to issues and problems of great magnitude, and is highly undesirable; and

Whereas mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform; and

Whereas one State, Massachusetts, has taken an important step toward the principles endorsed herein, and others promise to do so soon so that variants of the plan we endorse will, in the laboratory of the several States, soon be proved and perfected by experience, Now therefore be it

*Resolved*, That it is the sense of the Congress that the regulation of insurance should, in general, continue with the States, subject to the admonition, however, that Congress cannot, and will not, long ignore the need for evolving new and updated approaches to insurance and accident compensation.

That it is the further sense of the Congress that there must evolve at the State level a rational, equitable and compatible reparation system for motor vehicle accident victims supported and sustained by a similarly rational, equitable and compatible private insurance system, such combined system to be built upon the following principles:

1. Basic benefits should be forthcoming to the injured person on a first-party, contractual basis to the end that such person would be receiving benefits from the insurer with whom he has contracted and to whom he has paid his premiums and to the further end that competition among insurers would take the form of competition to provide prompter and more effective compensation for the premium payer.

2. Basic benefits under the reparations system should be payable to all accident victims without regard to fault, excluding, of course, those who willfully injure themselves.

3. Such benefits should provide compensation for all economic loss, subject to reasonable deductibles and limits, and the tort lawsuit should be eliminated, at least *pro tanto*, avoiding the adversary process for the mass of accidents.

4. The function of the reparations system should be to afford adequate, but not excessive, compensation to the accident victim at minimum cost. Therefore, the benefits obtainable by the accident victim from other benefit sources should be coordinated and meshed with those obtainable from the automobile accident reparations system with a view toward internalizing automobile accident loss costs by making automobile insurance the primary benefit source whenever feasible.

5. Maximum choice should be afforded the motorist in selecting his insurance source provided the coverage complies with the principles for the required minimum mandatory coverage.

6. Rehabilitation, avocational as well as vocational, should be a primary function and objective of the compensation system.

That it is the further sense of the Congress that the Secretary of Transportation be authorized and directed to request that the Council of State Governments, using the appropriate instrumentalities, develop model legislation for submission to the States for their consideration. The Secretary is further authorized and directed to analyze the actions of the States, their legislatures and insurance regulatory officials to determine to what extent such States act hereafter to bring about motor vehicle insurance and accident compensation systems consistent with the intent of this resolution; to provide technical assistance to and interact with such States, their legislatures and insurance regulatory officials in effecting in all the States compensation systems consistent with such

principles, and to report such progress as has been made, or is being made, in effecting such compensation systems, with a final report to be made by the Secretary not later than 25 months hereafter detailing the action taken by each State in moving toward or providing an automobile accident compensation system consistent with these principles; the experience of the States with these systems; and, concluding with the Secretary's views regarding the feasibility of attaining a satisfactory and compatible motor vehicle accident reparations system without further Federal legislation.

The CHAIRMAN. Now, I know that members of the committee have many questions to ask because this is a complex subject and will require, I am sure, some study on behalf of the committee members themselves.

They may have some different ideas about some of the things that are suggested. But I just want to ask this one question: On the basis of your statement, would it be fair to say that as far as the administration is concerned, the fault versus the no-fault issue has now been resolved?

Secretary VOLPE. Yes, sir.

The CHAIRMAN. And it is called for too in the major bill before this committee?

Secretary VOLPE. Yes, sir.

The CHAIRMAN. Leaving aside the issue of time and how it is accomplished, do you think we should go to a no-fault auto insurance system to cover most losses that occur as a result of automobile accidents? I think you answered that yourself in your statement.

Secretary VOLPE. Yes.

The CHAIRMAN. But this is an important point to focus on. I suppose you will answer yes to this question, reaching this conclusion, you and your advisers and those who conducted the study took into account the traditional arguments against no fault?

Secretary VOLPE. I heard those arguments, Mr. Chairman, for 5 years as Governor, and I can assure you that I have reviewed those arguments. There are personal friends of mine who tell me I am all wrong on this. As a matter of fact, after Massachusetts passed its law last year, two lawyers, both from Boston, both preeminent lawyers, gave me totally contrary judgments—one told me that it was the worst disaster in the history of Massachusetts legislation and would increase the cost of automobile insurance by at least 100 percent over a 4-year period, and the other fellow wanted to bet me all kinds of money or dinners or hats that it would decrease the cost of insurance by 25 percent.

Now, they are both reputable lawyers, but you take your choice as to which you think might be right. I think it is a further indication of the complexity of the problem we have before us.

The CHAIRMAN. Well, we will hear testimony on both sides of this matter. I am sure a great deal of it on the basic question of fault versus no fault.

Now, the Chairman is also somewhat confused and there may be good reasons for this. When the administration proposed a health insurance plan it was separate legislation, was it not, as you recall?

Secretary VOLPE. That is right.

The CHAIRMAN. And Secretary Richardson recommended Federal regulation of health insurance companies, which incidentally are a little bit connected with what we are talking about here.

Secretary VOLPE. Some of them are.

The CHAIRMAN. If a national health insurance system was created federally, I wonder if we could still argue that auto insurance be also made primary? I think we are going to run into that problem, the two methods of approach.

Secretary VOLPE. Mr. Chairman, I would say the difference here is the effective degree of regulation by the States. Health insurance, per se, is not regulated as closely by the States as auto insurance. Therefore, our argument is that the States be allowed to adjust their present regulation to do the job, and we have tried to encourage this through our statement here today, and through the proposition of having the Council of State Governments develop through one of its appropriate subdivisions, model legislation for State enactment that will get the job done.

Now, as I indicated in my testimony, I believe this should be kept under continuing surveillance, and I think that within a 2-year period we ought to review what the States have done. I think the States will act as a result of public opinion in many cases, I am sure this is true in Massachusetts, a form of no-fault insurance finally did pass, and I think it will pass in other States.

It is a question of trying to get them, however, to pass bills that will be as identical or as nearly similar as possible. I think this can be achieved through the development of the kind of model legislation I propose to the Council of State Governments to take on that job along the lines that we propose in the draft concurrent resolution.

The CHAIRMAN. Of course in any event, even assuming that we would proceed with the concurrent resolution approach, we would have a 2½-to 3-year period before it became anywhere near possible to have these States act because in so many States, the legislatures meet in January after the election and go out of session. I would think that it would be most difficult in a great number of States to approach this matter now. Although there has been introduced in the present sessions of State legislatures many of these types of bills.

Now, I don't know how many.

Secretary VOLPE. There are, I am told, about 26 States.

The CHAIRMAN. I know in my State there is a bill pending.

Secretary VOLPE. There are some 26 States in which bills have been introduced in one way or another calling for some type of no fault insurance.

The CHAIRMAN. Well, my experience in getting States to act on many matters involved in interstate commerce has been a little bit disappointing, may I say, over the years. We have had to tackle the matter in many fields in interstate commerce to provide a minimum Federal regulation or guidelines hoping that the States would either subscribe to that or even go above it, make it a tougher law.

This has been true in many consumer bills. Here we are suggesting the same kind of approach that seems to belie the fact that both you and I agree that these reforms are needed now. The startup.

Now, I have no doubt that after a long time of persuasion, and with more States adopting the no-fault law, the more the pressure would be on the States that haven't adopted it, but that it probably would be accomplished. But in the meantime I just feel we are not acting as

Secretary VOLPE. Senator, that expresses very clearly, I think, exactly our philosophy. It is not much different than our philosophy in highway safety standards in which we give the States an opportunity to comply with those safety standards and if they don't, there are certain things we can do to bring them into line. It is rather revealing to see how many States, as a matter of fact, practically all of the States come into line—not because we held a big stick but because we sold them on the idea that this is good for you to do. This will reduce the number of people killed on our highways annually. I would hope this could be the same type of approach we could use here.

Now, we can just pass a Federal law and say we will preempt the field or that this is how it is going to be done in every State regardless of the differences in those States and the complexities of the program. However, until you have had a chance to see the Massachusetts experience—which I don't think can be judged on the basis of some 60 days or 75 days of experience, which, by the way, has been reasonably good—or that of other States you are not going to be able to develop a decision as to which of these various paths that various States are going to take are going to be most productive.

Therefore, although I would like to think as a result of the study we have gathered a great deal of data that indicates directions that should be traveled, on the other hand I don't think this has gotten down to a scientific basis so well that we can say there is absolutely no question that that is the road to travel, every State travel it that way.

Senator COTTON. So, the approach you are suggesting carries a stick and also carries a carrot. It gives the States a chance to see if they can work out their own differences and it also provides, as in the case of Massachusetts and other States that appear to be considering such steps, the chance to provide an exploratory tryout of this system which will be beneficial to all the rest. The time will not be lost, for it will aid the Federal Government in case it becomes necessary to make the system uniform. They will have these benefits of trial and error.

Secretary VOLPE. That is absolutely in agreement with my own opinion, sir.

Senator COTTON. I am almost done, Mr. Chairman.

In your final report submitted today, which, of course, we haven't had time to read thoroughly, I note this language:

It should be emphasized that this is a goal to be achieved over time, not an action blueprint for tomorrow. Moving States toward such a goal would allow us to test its virtues and discover its faults, thereby giving us new knowledge that would serve to modify the goal itself. A little observation is worth a great deal of speculation and State experience with diverse trends would provide us with ad hoc opportunity for pilot project testing which must receive massive reform.

In other words, that again sounds a caution that experimentation by the States with no-fault insurance might show some fault with no-fault and the system itself which will enable you to avoid taking the time for Federal action.

Secretary VOLPE. Senator, I can only say that the science of this particular subject is such that there are many imponderables, certainly I don't believe there is a member of this committee as far as I know or any of the people in my shop who were working on the study who doesn't believe completely that a change is needed.

Whether or not a specific piece of legislation is going to give us the correct answers, the best answers for the consumer—because that is the man or woman we are trying to please—I can't say at this time until we have had more experience with the different types of no-fault operations that might be conducted in the various States.

Senator COTTON. I certainly agree with you, Mr. Secretary. I started practicing law and trying cases for a firm that represented a large number of liability insurance companies. I was broken into the practice of law largely by trying and defending automobile accident victims and defending insurance companies against claims, both personal injury and property. The fiction was being preserved that the jury wasn't supposed to know whether the defendant was insured, which was a little unfortunate if the defendant was not insured at that time. I well remember the first case I ever tried as a young lawyer. It was not a big case but the firm sent me in to try it, which I did for 3 long days as best I could. I felt that I had presented a real defense and I suppose I am admitting something I shouldn't admit, but I was able through the friendship of a deputy sheriff to get to the jury.

I was so guarding the jury, and so anxious because this was my first case, that he let me come up to the door and listen at the keyhole. After the wonderful defense I set up, the only discussion in the jury room was whether this guy was insured.

So, I think we have all had experiences that indicate that the old system is worn out. However, there is just one other query I have.

If the no-fault system works out and is adopted, either by the States or finally written into the Federal law, one of the problems is whether there will be a great additional cost of insurance to the consumer. Now, the insurance companies will say, presumedly, that one might well save a large amount of money in lawyer fees, trial costs, and all of the other things that go with the present system—including the higher return of premium dollars to the victims of accidents which, as you stated a moment ago, you sought as Governor of Massachusetts.

However, if you get a halfway system whereby personal injury is handled under the no-fault system, and property damages are left to litigation, then perhaps you haven't changed the system sufficiently. Wouldn't that mean a big leakage of premium dollars with the insurance companies going through all the trappings, retaining counsel and contesting some of the claims while others were handled by no-fault?

Secretary VOLPE. I think as I indicated in my testimony, Senator Cotton, that eventually you are going to have to go to no-fault all the way, based upon the knowledge we have today. But it seems to us you ought to approach it in stages rather than try to digest the whole ball of wax at one time.

Senator COTTON. Just one more practical matter.

Didn't Massachusetts have compulsory automobile liability insurance when you served as Governor of that State?

Secretary VOLPE. Yes.

Senator COTTON. Massachusetts adopted that 2 or 3 years before you became Governor, didn't it?

Secretary VOLPE. No; compulsory was in effect for many, many years, as a matter of fact. Some changes were made in it, but basically it was adopted over 35 years ago and I am sorry to say we were only

U.C. BERKELEY LIBRARY

one of three States in the Nation that had it and the number of claims and the cost of automobile accident insurance in Massachusetts was twice the national average. That is why I fought so hard at the time to try to eliminate that type of insurance and go to a financial responsibility law such as New Jersey had or to a no-fault system.

I was completely convinced of the no-fault benefits at that time and in the first bill I had provided for financial responsibility and in that same legislation provided for a study of no-fault so that we would have the benefit of utilizing a change to the financial responsibility law and then the benefit of this study of a no-fault system that could then be adopted if the study indicated it was a desirable thing to do.

Since that period a great deal of additional study has been made both by way of material we have gathered as a result of the DOT study and studies made by the States themselves so there is now a great deal more information available.

Senator COTTON. My own State moves into this theory on the every-dog-is-entitled-to-one-bite system. An owner or driver of an automobile isn't required to have car insurance until he has an accident.

Secretary VOLPE. That is similar to New Jersey.

Senator COTTON. It is a pitfall for the unwary and I think carries all the faults of both systems.

Governor, would you be—pardon me, Mr. Secretary.

I have become accustomed to calling you Governor for many years.

Secretary VOLPE. I prefer Governor, Senator.

Senator COTTON. To continue then, Governor, you consider that it is quite possible that at some subsequent time this might have to be the subject of Federal legislation, but you do feel that first it should be demonstrated that the States can't handle it or won't handle it sufficiently to solve this problem.

Is that a fair summary of your attitude?

Secretary VOLPE. I would say that was reasonably fair, with one additional proviso. I don't want to have the situation remain as it is today with the States just being told: "Well, do the best you can fellows and try to reform this some time soon," without anything else being done. That is why we propose that the Council of State Governments—which I had the privilege of serving as president of some 3 or 4 years ago—through one of its appropriate bodies, be commissioned the task of developing model legislation and have this legislation available reasonably soon so that it could be distributed to each of the State governments that have not acted on this matter by that time. This would give them the opportunity to adopt that model legislation.

Senator COTTON. In connection with your statement, you submitted a suggested resolution for Congress to adopt. In that resolution, which I haven't had an opportunity to study, is there a distinct and definite information to the States that if they don't act we shall?

Secretary VOLPE. Senator Cotton, I don't know that those specific words—

Senator COTTON. Well, I asked if there is some information to that effect.

Secretary VOLPE. The last paragraph, as a matter of fact, of the resolution, the entire resolution, without reading it all \* \* \* "the action taken by each State in moving toward or providing an auto-

mobile accident compensation system, consistent with these principles; the experience of the States with these systems; and concluding with the Secretary's views regarding the feasibility of obtaining a satisfactory and compatible motor vehicle accident reparations systems without further Federal legislation."

In other words, what we are saying is that we should come back to you in 2 years, and if we give you some answers that, in effect, say that no further Federal legislation is required, fine, but if by the same token we believe further Federal legislation is required because the States have not done the job, we are certainly willing to come back and say that. And that pretty well tells the States what they can expect if they don't do the job themselves.

Senator COTTON. Would you agree that we must face the fact that the day the Federal Government finds it necessary to move into this field and make a Federal no-fault law, that same day we certainly would have to move in on the other bill that we had last session concerning insolvencies and the Federal Insurance Guarantee Corp?

In other words, the Federal Government would move into federally regulated insurance regardless of what the States had done and were trying to do.

Secretary VOLPE. It would certainly draw that day much closer, sir.

Senator COTTON. Thank you.

The CHAIRMAN. Well, I think the record ought to show, too, that you say the States very clearly moved off dead center and would appear to be achieving some momentum but you couldn't have made that statement a year ago.

Secretary VOLPE. That is right, sir.

The CHAIRMAN. You know why they are doing it, don't you?

Secretary VOLPE. I think so.

The CHAIRMAN. They are doing it because we have been at them.

Secretary VOLPE. That helps, Mr. Chairman.

The CHAIRMAN. Yes. Take the insurance commissioners. Senator Cotton and I had an experience with them on the insolvency proposals. They wanted State action similar to this and we have waited a long time, haven't we; and it has not happened yet.

Senator COTTON. Well, my State has been pretty good.

The CHAIRMAN. Yes; but they did want us to keep the bill going and keep the pressure on. That will be helpful. So we have to consider a reverse position here such as passing some Federal regulations which say to the States: When you achieve a certain level of performance then you are out from under. But until you do it, the Federal law is going to apply.

We have done that with some laws. I do not know how that would work as a practical matter here.

Then we have to deal with the insurance commissioners in most States. In many of the States they are elected, not appointed.

All right. Senator Hart.

Senator HART. Thank you.

Mr. Secretary, Senator Cotton was talking about his early experience with a jury. You are on notice that two of the jurors up here already have reached our conclusions which sort of destroys zip on any questions I might have, but I will ask them anyway.

I refer to the statement of Senator Magnuson that "Senator Hart and I made our position quite clear that a national no-fault approach is needed and it is needed now."

I have read—not as carefully as I intended—the document that you have filed with us, the report, oral summary of which, or highlights of which you have just given us. I will go back and read it again. But I think most of the questions that you leave unanswered in your oral testimony are answered in the document. So I hope all of us will read the document.

I will make an opening observation here and insist that you not respond.

Secretary VOLPE. I hope the temptation is not too great, Senator.

Senator HART. I am reminded of a quarterback who had about 30 seconds left in the fourth quarter; he is fourth and goal on the 2, 6 points behind, and he knows what play to call. But the coach sends in another signal and he does not call the play he knows will work.

Secretary VOLPE. I won't be tempted, Senator.

Senator COTTON. That is the quarterback that sustained personal injuries. [Laughter.]

Senator HART. That is a quarterback who performs in protection of his scholarship.

Secretary VOLPE. I am not on a scholarship, Senator. Nor do I, thank God, need one.

Senator HART. No; I realize that.

Now, we have been sitting here about an hour, a little more than an hour. In that period of time there have been 2,300 automobile accidents. There have been 500 personal injuries. Fifty-six of those personal injuries are serious, and seven have been killed. What is the difference whether it occurred in Michigan or Massachusetts, first of all? What is the difference? To put it more extreme: Wyoming or Idaho or New York or California?

Secretary VOLPE. If a person is killed, as you and I know, it is a human life lost, no matter where he is killed.

Senator HART. If there is a need for hospitalization, there is a hospital bed either place and, if there is a loss of income, it occurs either or any place.

Secretary VOLPE. Right.

Senator HART. What is the philosophy we are talking about here? You said in answer to a question earlier, you said it was a question of whether you wanted to move on a Federal no-fault now, or a question of dictating to the States. I would suggest that it is an assumption of responsibility which is ours in view of the record here—ours meaning the Federal Government. Would you care to comment on that?

Secretary VOLPE. Yes, sir. I can only say, sir, that the science of the subject that we have been discussing today is only now becoming very well or widely understood. I have had many battles in this area with people who are very close to me, and I have overridden their suggestions or recommendations because I believed, as a result of my experiences and as a result of reviewing the records that were shown to me in my own State, that there ought to be a better way to run a railroad than it was being run in Massachusetts, insofar as automobile accident insurance was concerned.

On the other hand, I think, if we are to preserve in this Nation "federalism," the Federal-State partnership, that unless the States refuse to act that we should do everything we can to preserve that Federal-State partnership, to provide the guidance and leadership to them to act and then if they refuse to act, use the stick if that is necessary and do everything possible in between to bring about a solution without waiting for additional thousands to be killed, or additional thousands to be injured.

The fact is that we are approaching this problem not on one front alone, as I am sure you are probably aware, Senator Hart. We are approaching the problem of crash losses in our highway safety program with a tremendous thrust insofar as alcohol countermeasures programs are concerned.

Fifty percent of the auto accident deaths in this Nation come from that one source. We believe that source is a very rich one for us to try to get rewarding results from. That is why we are attacking that problem as seriously and as fully as we can.

I still cannot help but believe that we do not have final answers as to the best way to go insofar as the no-fault system is concerned, even though you and I can agree completely that there is a need for change, and the no-fault approach appears to be the best avenue for change.

Senator HART. Well, I read your report and indeed got the impression from your oral presentation that with respect to what I think you call stage one, namely, medical and rehabilitation costs and some income protection, that you do know or that you do agree that no-fault is the answer; the stage two, the extending more fully of income protection; and stage three, the property-damage thing, there is less certainty or clarity. But with respect to the need for no-fault for medical expenses and rehabilitation cost and some income insurance I take it no-fault is nailed down as the answer. It is required.

You say in your report that if Congress passes this resolution and if the Council of State governments cranks up, a period of perhaps 5 years seems reasonable, at which time we will find, through the action of 50 State legislatures, national no-fault in this stage one area.

Secretary VOLPE. I would only disagree, Senator, with the 5-year period. I will not disagree with the 5 years insofar as all 50 States are concerned. I would say I would think—having served as president of the Council of State governments, that they could come up with a piece of model legislation in perhaps as little as a year. With the pressures that are building up with the increasing costs, I think we will see a substantial number of these States that will adopt legislation particularly as the results come in from the first States that do this. For instance, in Massachusetts, which will complete a full year this December you will not have just theoretical or problematical answers, you will have actual experience on which a Governor can go before a legislature and say:

I am not talking about theory; I am talking about what actually happened, and this is how much the cost of insurance went down in the State of Massachusetts.

Senator HART. I reopened hearings on this subject in the Antitrust Committee just 5 years ago. And what progress—well, we get a lot more attention, but it is still very much in the discussion stage for those 2,300 people that were involved in accidents in the last hour.

Your report suggests 5 years as a reasonable but admittedly a very tentative projection. What do you say to the 500,000 that will be seriously injured each of those years? Do I say, well, I passed a resolution? Which is why I will continue to be—I assume it will sound heavy-handed, but I will be anxious to insure that we do that which is most likely to give those people the kind of protection that you and I and all of us agree ought to be made available.

The track record in the State legislatures for adoption of model laws, even when nobody is against them, is depressing. The model traffic code, we began to try to sell that in 1934 and we are still selling it, and I do not know anybody who is against it. Certainly no organized segment of the bar. It has the support of the entire insurance industry. Here is 1971 and we are still trying to sell that.

Secretary VOLPE. I would submit, if I may, Senator Hart, that there are other areas, however, where the States have acted, although not as quickly perhaps as you and I would like to see. But you take the National Driver Register, I had to push and push awfully hard, but I finally got my State to join that. All 50 States have now joined it and they see the wisdom of it and the benefits deriving from it.

Senator HART. I will quote a State letter to indicate why some of us have less optimism than even a 5-year period, notwithstanding a public concern and interest, notwithstanding that one State in 50 now has a limited no-fault plan on the books. And one territory, Puerto Rico, where I think you get some answers to some of the questions you raise.

But in any event, here is an Illinois State representative, Anthony Scariano. He sponsored no-fault bills in Illinois, a series of them, and they have all died. He is quoted in this way:

As long as you have a statehouse full of lawyers and insurance men you are not going to have no-fault insurance in your State and that is as certain as the next accident.

Now, this is harsh, I know. But I think one could find some indication of a basis for his comment without even doing a Ph. D. dissertation on the subject of how State legislatures work in this area. How are you going to overcome that resistance? Does this resolution help, do you think?

Secretary VOLPE. I think the resolution would help, sir. I think we have in Massachusetts, and I do not like to use my State particularly, but it just so happens that it is the State that has taken some action first and I think, if I remember correctly, we have as large a percentage of insurance agents, brokers, et cetera, as well as lawyers in the Massachusetts Legislature as there are in any other legislature in the Nation.

It took some time, a lot of pressure, and a lot of hard work on the part of people. The bill came not because it was introduced in one year but because of a lot of work that was done over the course of years and finally it was passed.

Senator HART. I know you put a lot of time in it and the goal—the ultimate goal is the desirable one. But the Massachusetts bill is really an agent's bill with a label "no fault." It takes care of all the small nuisance claims on the first-party basis because it cuts off at \$2,000. Isn't that the figure?

Secretary VOLPE. Yes.

Senator HART. It saves carefully the tort system for the juicy ones. The seriously injured are items on the dockets that pile up for years if they have not been pressured into taking a settlement sooner. So that notwithstanding the energy involved in even getting that much, I think that rather tends to support the view of those of us who would be very pessimistic that the passage of a congressional resolution, a prayer, and good work and time, all of that going on, would give us the action in sufficiently short time as to justify us saying to those who will be injured and killed in the meantime, we are sorry, there is a concept of federalism involved and we are doing the best we can.

That did not hang the President up in recommending that the Federal Government regulate the health insurance field. He said there is a crisis and we have to move in. I would hope it will not hang us up, because the same description is applicable to this area.

I have other questions, but I will pass.

Senator COTTON. Mr. Chairman, I have to go back to the Appropriations Subcommittee. I would like to request that in view of all this discussion that the record of this hearing be held open for perhaps a week, if the Chairman is willing, to afford the Secretary an opportunity to file anything further he might want.

The CHAIRMAN. Without objection.

Senator HART. If I might reserve the right to file in writing these additional questions to which responses can be made, I will do that.

The CHAIRMAN. Yes.

Senator BAKER. Mr. Chairman, I know the hour is late, and I won't take long, but I want to make a preliminary remark or two that I think will set the stage for the few questions I would like to ask the Secretary.

I have a high regard for our distinguished colleague from Michigan; and I am glad he set the stage by pointing out this proceeding is in no way a judicial one, and we don't purport to sit as jurors.

I think it is probably a safe statement, however, to estimate that, just as Senator Hart has expressed a low opinion of the State legislatures of the country, both of us have been in contact with enough of our colleagues in State houses and State senates, to know that they have about the same opinion of us as we have of them.

Also, I am mindful of the fact that there is a genuine concern on the part of the Senator from Michigan and I think of all the members of this committee and the Senate to provide compassionately for those who are injured in automobile accidents, or whose lives are forfeited because of negligence or fortuitous circumstances on the highway, whatever happens to be the case.

But I caution we ought not to confuse the desirability, or lack of it, of changing the tort system with our instinct for self-preservation.

Whatever we do, this resolution may or may not have something to do with the death toll and the number that are maimed and injured on our highways. But if it does, the chances are the passage of a no-fault system would make the matter worse, instead of better.

I express no opinion on my support or opposition to your resolution, Mr. Secretary, or the concept of no-fault insurance at this point. But I hazard the observation that the negligence system, grounded in the common law, complete with its concept of special damages or com-

viously, has not changed in the last 6 months. But complexity, difficulty, or whatever, should no longer stand in the way of action. This administration and I want to cooperate with and support those who also want to get on with the process of reform.

Mr. Chairman, this completes my prepared testimony. We will be happy to answer any questions you or the other members may have.

I have here the proposed concurrent resolution, which I can read if you desire. Each of you have a copy and you may prefer that it be added to the record. I will be guided by your preference, Mr. Chairman.

The CHAIRMAN. Thank you, Mr. Secretary.

We will put the concurrent resolution in the record here in full and it will probably be referred to this committee when we meet tomorrow. So we will have that before us and also the bills that have been introduced, mainly the main bill which has been before this committee for some time, and there are some other bills. So we will have before us the opportunity to look at all of these proposals and that is what the committee intends to do.

(The concurrent resolution follows:)

#### CONCURRENT RESOLUTION

Whereas the existing system for compensating motor accident victims results in the unavailability of any benefits to many persons sustaining loss arising out of motor vehicle accidents, including many seriously injured persons and the dependents of many persons killed in such accidents; and

Whereas the existing system's uneven allocation of compensation benefits results in the excessive compensation of many persons sustaining only minor loss, and whereas by contrast many persons with severe and permanently crippling injuries recover only a fraction of their losses in compensation benefits from the system; and

Whereas administration of the system consumes an inordinate amount of resources which might be put to better use in compensating accident victims; and

Whereas the system's benefits tend to be ill-timed and unresponsive to victims' needs both because of long delays in payment and because benefits are predominantly in the form of lump sum payments, and whereas effective rehabilitation of the accident victim tends to be a practical impossibility under the system; and

Whereas the system is supported by, and dependent upon, compulsory insurance or financial responsibility laws which exert varying degrees of compulsion upon motorists to purchase liability insurance without invariably assuring motorists of the availability of automobile insurance; and

Whereas the counterproductive regulatory pressures placed by the system on insurers has led to the development of socially undesirable competition in risk selection accompanied by arbitrary and capricious declinations of insurance, cancellations and refusals of renewal with the consequent growth of a high-risk automobile insurance market serviced in some cases by insurers of questionable financial stability; and

Whereas the system has imposed intolerable burdens on State officials responsible for regulating the rating, underwriting and claims practices of insurers and responding to consumer complaints relating thereto; and

Whereas the system has placed an unreasonable workload on the Federal and State courts which have been forced to devote a disproportionate part of their time and resources to motor vehicle accident civil litigation; and

Whereas the system has resulted in the denial of substantial and equal justice to seriously injured accident victims who are unable to withstand the financial burdens consequent upon long court delays and who are, therefore, forced into inadequate settlements of their claims; and

Whereas the existing liability insurance system renders it impossible rationally to allocate insurance premium costs so as to reflect the ability of a motor vehicle to protect its occupants from serious injury in the event of a crash or to reflect differing costs of repairing motor vehicles; and

Whereas, however, prompted by the Automobile Insurance and Accident Insurance Study mandated by Congress, the Hearings of Congressional committees and the various hearings and studies conducted by many State legislatures, it is now almost universally conceded that there is an imperative need for prompt and far-reaching reform; and

Whereas one State, the Commonwealth of Massachusetts, has taken the lead by enacting the first partial no-fault plan in the country and many of the State legislatures are even now considering far-reaching reforms suited to the needs of their constituencies; and

Whereas the principal problems and abuses with respect to automobile insurance clearly stem from defects in the system for compensating accident victims and from the compulsions upon motorists to obtain the insurance which sustains and upholds that system rather than from defects in the insurance institution or in its regulation by the several States; and

Whereas assumption of the present comprehensive State regulatory authority over automobile insurance by the Federal Government would be fraught with great and grave consequences giving rise to issues and problems of great magnitude, and is highly undesirable; and

Whereas mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform; and

Whereas one State, Massachusetts, has taken an important step toward the principles endorsed herein, and others promise to do so soon so that variants of the plan we endorse will, in the laboratory of the several States, soon be proved and perfected by experience, Now therefore be it

*Resolved*, That it is the sense of the Congress that the regulation of insurance should, in general, continue with the States, subject to the admonition, however, that Congress cannot, and will not, long ignore the need for evolving new and updated approaches to insurance and accident compensation.

That it is the further sense of the Congress that there must evolve at the State level a rational, equitable and compatible reparation system for motor vehicle accident victims supported and sustained by a similarly rational, equitable and compatible private insurance system, such combined system to be built upon the following principles:

1. Basic benefits should be forthcoming to the injured person on a first-party, contractual basis to the end that such person would be receiving benefits from the insurer with whom he has contracted and to whom he has paid his premiums and to the further end that competition among insurers would take the form of competition to provide prompter and more effective compensation for the premium payer.

2. Basic benefits under the reparations system should be payable to all accident victims without regard to fault, excluding, of course, those who willfully injure themselves.

3. Such benefits should provide compensation for all economic loss, subject to reasonable deductibles and limits, and the tort lawsuit should be eliminated, at least *pro tanto*, avoiding the adversary process for the mass of accidents.

4. The function of the reparations system should be to afford adequate, but not excessive, compensation to the accident victim at minimum cost. Therefore, the benefits obtainable by the accident victim from other benefit sources should be coordinated and meshed with those obtainable from the automobile accident reparations system with a view toward internalizing automobile accident loss costs by making automobile insurance the primary benefit source whenever feasible.

5. Maximum choice should be afforded the motorist in selecting his insurance source provided the coverage complies with the principles for the required minimum mandatory coverage.

6. Rehabilitation, avocational as well as vocational, should be a primary function and objective of the compensation system.

That it is the further sense of the Congress that the Secretary of Transportation be authorized and directed to request that the Council of State Governments, using the appropriate instrumentalities, develop model legislation for submission to the States for their consideration. The Secretary is further authorized and directed to analyze the actions of the States, their legislatures and insurance regulatory officials to determine to what extent such States act hereafter to bring about motor vehicle insurance and accident compensation systems consistent with the intent of this resolution; to provide technical assistance to and interact with such States, their legislatures and insurance regulatory officials in effecting in all the States compensation systems consistent with such

principles, and to report such progress as has been made, or is being made, in effecting such compensation systems, with a final report to be made by the Secretary not later than 25 months hereafter detailing the action taken by each State in moving toward or providing an automobile accident compensation system consistent with these principles; the experience of the States with these systems; and, concluding with the Secretary's views regarding the feasibility of attaining a satisfactory and compatible motor vehicle accident reparations system without further Federal legislation.

The CHAIRMAN. Now, I know that members of the committee have many questions to ask because this is a complex subject and will require, I am sure, some study on behalf of the committee members themselves.

They may have some different ideas about some of the things that are suggested. But I just want to ask this one question: On the basis of your statement, would it be fair to say that as far as the administration is concerned, the fault versus the no-fault issue has now been resolved?

Secretary VOLPE. Yes, sir.

The CHAIRMAN. And it is called for too in the major bill before this committee?

Secretary VOLPE. Yes, sir.

The CHAIRMAN. Leaving aside the issue of time and how it is accomplished, do you think we should go to a no-fault auto insurance system to cover most losses that occur as a result of automobile accidents? I think you answered that yourself in your statement.

Secretary VOLPE. Yes.

The CHAIRMAN. But this is an important point to focus on. I suppose you will answer yes to this question, reaching this conclusion, you and your advisers and those who conducted the study took into account the traditional arguments against no fault?

Secretary VOLPE. I heard those arguments, Mr. Chairman, for 5 years as Governor, and I can assure you that I have reviewed those arguments. There are personal friends of mine who tell me I am all wrong on this. As a matter of fact, after Massachusetts passed its law last year, two lawyers, both from Boston, both preeminent lawyers, gave me totally contrary judgments—one told me that it was the worst disaster in the history of Massachusetts legislation and would increase the cost of automobile insurance by at least 100 percent over a 4-year period, and the other fellow wanted to bet me all kinds of money or dinners or hats that it would decrease the cost of insurance by 25 percent.

Now, they are both reputable lawyers, but you take your choice as to which you think might be right. I think it is a further indication of the complexity of the problem we have before us.

The CHAIRMAN. Well, we will hear testimony on both sides of this matter. I am sure a great deal of it on the basic question of fault versus no fault.

Now, the Chairman is also somewhat confused and there may be good reasons for this. When the administration proposed a health insurance plan it was separate legislation, was it not, as you recall?

Secretary VOLPE. That is right.

The CHAIRMAN. And Secretary Richardson recommended Federal regulation of health insurance companies, which incidentally are a little bit connected with what we are talking about here.

Secretary VOLPE. Some of them are.

The CHAIRMAN. If a national health insurance system was created federally, I wonder if we could still argue that auto insurance be also made primary? I think we are going to run into that problem, the two methods of approach.

Secretary VOLPE. Mr. Chairman, I would say the difference here is the effective degree of regulation by the States. Health insurance, per se, is not regulated as closely by the States as auto insurance. Therefore, our argument is that the States be allowed to adjust their present regulation to do the job, and we have tried to encourage this through our statement here today, and through the proposition of having the Council of State Governments develop through one of its appropriate subdivisions, model legislation for State enactment that will get the job done.

Now, as I indicated in my testimony, I believe this should be kept under continuing surveillance, and I think that within a 2-year period we ought to review what the States have done. I think the States will act as a result of public opinion in many cases, I am sure this is true in Massachusetts, a form of no-fault insurance finally did pass, and I think it will pass in other States.

It is a question of trying to get them, however, to pass bills that will be as identical or as nearly similar as possible. I think this can be achieved through the development of the kind of model legislation I propose to the Council of State Governments to take on that job along the lines that we propose in the draft concurrent resolution.

The CHAIRMAN. Of course in any event, even assuming that we would proceed with the concurrent resolution approach, we would have a 2½-to 3-year period before it became anywhere near possible to have these States act because in so many States, the legislatures meet in January after the election and go out of session. I would think that it would be most difficult in a great number of States to approach this matter now. Although there has been introduced in the present sessions of State legislatures many of these types of bills.

Now, I don't know how many.

Secretary VOLPE. There are, I am told, about 26 States.

The CHAIRMAN. I know in my State there is a bill pending.

Secretary VOLPE. There are some 26 States in which bills have been introduced in one way or another calling for some type of no fault insurance.

The CHAIRMAN. Well, my experience in getting States to act on many matters involved in interstate commerce has been a little bit disappointing, may I say, over the years. We have had to tackle the matter in many fields in interstate commerce to provide a minimum Federal regulation or guidelines hoping that the States would either subscribe to that or even go above it, make it a tougher law.

This has been true in many consumer bills. Here we are suggesting the same kind of approach that seems to belie the fact that both you and I agree that these reforms are needed now. The startup.

Now, I have no doubt that after a long time of persuasion, and with more States adopting the no-fault law, the more the pressure would be on the States that haven't adopted it, but that it probably would be accomplished. But in the meantime I just feel we are not acting as

promptly as we should in this matter. But that is my opinion and I will look at the report.

Now, do you have in the report a review? I haven't had a chance to look at it all yet—a review on the cost figures to the public if one system was adopted as against other system, or do you have it merely as to what the cost figures would be, the way it is now, and whether or not it would cost more to the public or less?

Secretary VOLPE. May I have Charlie Baker answer that question, please, Mr. Chairman?

Mr. BAKER. Mr. Chairman—

The CHAIRMAN. Is that on page 138?

Mr. BAKER. Pages 138 and 139; yes, sir. This is a summary of the cost aspects of some of the changes that are suggested in this report. This is what we have tried to make clear in both the report and the Secretary's testimony. There is a great deal of controversy and different analyses have been provided by interested parties on what the precise cost impacts of various no-fault plans would be.

Nonetheless, on these pages we have summarized what we believe will be the underlying factors which will lead to significant cost improvement in the system, sir.

The CHAIRMAN. Well, you say it would appear, and the Secretary's statement is that the true cost of compensating the socially significant losses from motor vehicle accidents should be reduced since more of the insurance premium dollar would go for needed benefits and less for system expenses.

Then you say further on, equity of a better compensation system should not yield to cost in our list of priorities.

Are they inconsistent, those two statements?

Mr. BAKER. I don't think so, Mr. Chairman.

I think what we are suggesting is—

The CHAIRMAN. I don't think they are as to objectives, but as a practical matter are they inconsistent?

Mr. BAKER. I think we are suggesting two things here, Mr. Chairman. First, that, fundamentally, the cost of operating the system could in fact be improved by the approaches there recommended; but, second, that the objective of providing full reparations for the socially significant economic losses of the injured parties should be an all-important objective of any measure of reform.

The CHAIRMAN. Well, we will look at that, and I just have one more observation. It isn't a question. We will read this final report carefully and go over it and the legislation.

But I am wondering why we don't suggest, or you don't, that if we are going to do this, even assuming we would do it in stages, why we shouldn't move to the first stage now? On a Federal level?

Secretary VOLPE. I think, Mr. Chairman, that just comes down to the basic philosophy of whether or not we desire to undertake to accomplish this job through Federal—well, call it dictation as some people do, that would apply the same solution at the same time both in New York and Wyoming. I think all of us would recognize the problems are quite different in New York and Massachusetts, than they might be in Wyoming or Idaho.

So we are suggesting if the States don't take the kind of action which you and I believe are essential, then, as is necessary, we can

provide not only guidelines as we are trying to provide today, but we can actually provide standards below which they can't go and above which they might want to go.

The CHAIRMAN. When I speak of the first stage, I am thinking in terms of compulsory insurance covering basic economic loss.

Now, I am not speaking about all of the different guidelines and procedures involved in accidents and things, but I am speaking about the coverage as a first stage.

Secretary VOLPE. We have had compulsory personal injury liability insurance in Massachusetts, Mr. Chairman, for 40 years almost. Contrary to what some people say, that is, "We have done it this way for 40 years, and if it was good enough 40 years ago, it is good enough now." I just didn't agree with that thesis at all, and that is why we tried to change it.

The fact is, too much of the premium dollar was not going to the people who were being injured, and that is why I felt rather strongly it ought to be changed.

The CHAIRMAN. Now, I know the committee members have some questions and I don't have any more, particularly. I may have some a little later.

Senator Cotton?

Senator COTTON. Mr. Secretary, I gather that the thrust of your testimony herè today is directed toward implementing your Department's 2-year study by encouraging State action and not Federal preemption at the present time. Is that correct?

Secretary VOLPE. That is correct, sir.

Senator COTTON. I think I am correct and that the record bears me out when I say that the position you advocated back on October 7, in answer to some of my own questions, is consistent with your position today. You stated in part last October 7:

I think that we ought to be able, if we develop a set of guidelines, a broad outline, to develop the kind of cooperation with the states that I think will assure success.

Do you recall that statement?

Secretary VOLPE. Yes; I do, sir.

I have those places marked in this copy of my testimony in case this came up.

Senator COTTON. That is entirely consistent with the position that you are taking today, or rather your position today is somewhat of an expansion and a particularization of your general statement last October.

Secretary VOLPE. You are absolutely correct.

Senator COTTON. Now, in one of your reports entitled "Economic Regulation of Insurance in the United States," the following statement appears:

By threatening to assume the regulatory function, the Federal authority may accomplish more than by actually assuming it.

Now, I assume this is the big stick in the whole proposition. Rather than to move headlong into a new field by assuming the federalization of insurance it is your position that giving the States a chance to operate, with the very clear implication if they don't Federal action may follow, is all that is needed.

Is that a correct statement of your approach?

Secretary VOLPE. Senator, that expresses very clearly, I think, exactly our philosophy. It is not much different than our philosophy in highway safety standards in which we give the States an opportunity to comply with those safety standards and if they don't, there are certain things we can do to bring them into line. It is rather revealing to see how many States, as a matter of fact, practically all of the States come into line—not because we held a big stick but because we sold them on the idea that this is good for you to do. This will reduce the number of people killed on our highways annually. I would hope this could be the same type of approach we could use here.

Now, we can just pass a Federal law and say we will preempt the field or that this is how it is going to be done in every State regardless of the differences in those States and the complexities of the program. However, until you have had a chance to see the Massachusetts experience—which I don't think can be judged on the basis of some 60 days or 75 days of experience, which, by the way, has been reasonably good—or that of other States you are not going to be able to develop a decision as to which of these various paths that various States are going to take are going to be most productive.

Therefore, although I would like to think as a result of the study we have gathered a great deal of data that indicates directions that should be traveled, on the other hand I don't think this has gotten down to a scientific basis so well that we can say there is absolutely no question that that is the road to travel, every State travel it that way.

Senator COTTON. So, the approach you are suggesting carries a stick and also carries a carrot. It gives the States a chance to see if they can work out their own differences and it also provides, as in the case of Massachusetts and other States that appear to be considering such steps, the chance to provide an exploratory tryout of this system which will be beneficial to all the rest. The time will not be lost, for it will aid the Federal Government in case it becomes necessary to make the system uniform. They will have these benefits of trial and error.

Secretary VOLPE. That is absolutely in agreement with my own opinion, sir.

Senator COTTON. I am almost done, Mr. Chairman.

In your final report submitted today, which, of course, we haven't had time to read thoroughly, I note this language:

It should be emphasized that this is a goal to be achieved over time, not an action blueprint for tomorrow. Moving States toward such a goal would allow us to test its virtues and discover its faults, thereby giving us new knowledge that would serve to modify the goal itself. A little observation is worth a great deal of speculation and State experience with diverse trends would provide us with ad hoc opportunity for pilot project testing which must receive massive reform.

In other words, that again sounds a caution that experimentation by the States with no-fault insurance might show some fault with no-fault and the system itself which will enable you to avoid taking the time for Federal action.

Secretary VOLPE. Senator, I can only say that the science of this particular subject is such that there are many imponderables, certainly I don't believe there is a member of this committee as far as I know or any of the people in my shop who were working on the study who doesn't believe completely that a change is needed.

Whether or not a specific piece of legislation is going to give us the correct answers, the best answers for the consumer—because that is the man or woman we are trying to please—I can't say at this time until we have had more experience with the different types of no-fault operations that might be conducted in the various States.

Senator COTTON. I certainly agree with you, Mr. Secretary. I started practicing law and trying cases for a firm that represented a large number of liability insurance companies. I was broken into the practice of law largely by trying and defending automobile accident victims and defending insurance companies against claims, both personal injury and property. The fiction was being preserved that the jury wasn't supposed to know whether the defendant was insured, which was a little unfortunate if the defendant was not insured at that time. I well remember the first case I ever tried as a young lawyer. It was not a big case but the firm sent me in to try it, which I did for 3 long days as best I could. I felt that I had presented a real defense and I suppose I am admitting something I shouldn't admit, but I was able through the friendship of a deputy sheriff to get to the jury.

I was so guarding the jury, and so anxious because this was my first case, that he let me come up to the door and listen at the keyhole. After the wonderful defense I set up, the only discussion in the jury room was whether this guy was insured.

So, I think we have all had experiences that indicate that the old system is worn out. However, there is just one other query I have.

If the no-fault system works out and is adopted, either by the States or finally written into the Federal law, one of the problems is whether there will be a great additional cost of insurance to the consumer. Now, the insurance companies will say, presumedly, that one might well save a large amount of money in lawyer fees, trial costs, and all of the other things that go with the present system—including the higher return of premium dollars to the victims of accidents which, as you stated a moment ago, you sought as Governor of Massachusetts.

However, if you get a halfway system whereby personal injury is handled under the no-fault system, and property damages are left to litigation, then perhaps you haven't changed the system sufficiently. Wouldn't that mean a big leakage of premium dollars with the insurance companies going through all the trappings, retaining counsel and contesting some of the claims while others were handled by no-fault?

Secretary VOLPE. I think as I indicated in my testimony, Senator Cotton, that eventually you are going to have to go to no-fault all the way, based upon the knowledge we have today. But it seems to us you ought to approach it in stages rather than try to digest the whole ball of wax at one time.

Senator COTTON. Just one more practical matter.

Didn't Massachusetts have compulsory automobile liability insurance when you served as Governor of that State?

Secretary VOLPE. Yes.

Senator COTTON. Massachusetts adopted that 2 or 3 years before you became Governor, didn't it?

Secretary VOLPE. No; compulsory was in effect for many, many years, as a matter of fact. Some changes were made in it, but basically it was adopted over 35 years ago and I am sorry to say we were only

one of three States in the Nation that had it and the number of claims and the cost of automobile accident insurance in Massachusetts was twice the national average. That is why I fought so hard at the time to try to eliminate that type of insurance and go to a financial responsibility law such as New Jersey had or to a no-fault system.

I was completely convinced of the no-fault benefits at that time and in the first bill I had provided for financial responsibility and in that same legislation provided for a study of no-fault so that we would have the benefit of utilizing a change to the financial responsibility law and then the benefit of this study of a no-fault system that could then be adopted if the study indicated it was a desirable thing to do.

Since that period a great deal of additional study has been made both by way of material we have gathered as a result of the DOT study and studies made by the States themselves so there is now a great deal more information available.

Senator COTTON. My own State moves into this theory on the every-dog-is-entitled-to-one-bite system. An owner or driver of an automobile isn't required to have car insurance until he has an accident.

Secretary VOLPE. That is similar to New Jersey.

Senator COTTON. It is a pitfall for the unwary and I think carries all the faults of both systems.

Governor, would you be—pardon me, Mr. Secretary.

I have become accustomed to calling you Governor for many years.

Secretary VOLPE. I prefer Governor, Senator.

Senator COTTON. To continue then, Governor, you consider that it is quite possible that at some subsequent time this might have to be the subject of Federal legislation, but you do feel that first it should be demonstrated that the States can't handle it or won't handle it sufficiently to solve this problem.

Is that a fair summary of your attitude?

Secretary VOLPE. I would say that was reasonably fair, with one additional proviso. I don't want to have the situation remain as it is today with the States just being told: "Well, do the best you can fellows and try to reform this some time soon," without anything else being done. That is why we propose that the Council of State Governments—which I had the privilege of serving as president of some 3 or 4 years ago—through one of its appropriate bodies, be commissioned the task of developing model legislation and have this legislation available reasonably soon so that it could be distributed to each of the State governments that have not acted on this matter by that time. This would give them the opportunity to adopt that model legislation.

Senator COTTON. In connection with your statement, you submitted a suggested resolution for Congress to adopt. In that resolution, which I haven't had an opportunity to study, is there a distinct and definite information to the States that if they don't act we shall?

Secretary VOLPE. Senator Cotton, I don't know that those specific words—

Senator COTTON. Well, I asked if there is some information to that effect.

Secretary VOLPE. The last paragraph, as a matter of fact, of the resolution, the entire resolution, without reading it all \* \* \* "the action taken by each State in moving toward or providing an auto-

mobile accident compensation system, consistent with these principles; the experience of the States with these systems; and concluding with the Secretary's views regarding the feasibility of obtaining a satisfactory and compatible motor vehicle accident reparations systems without further Federal legislation."

In other words, what we are saying is that we should come back to you in 2 years, and if we give you some answers that, in effect, say that no further Federal legislation is required, fine, but if by the same token we believe further Federal legislation is required because the States have not done the job, we are certainly willing to come back and say that. And that pretty well tells the States what they can expect if they don't do the job themselves.

Senator COTTON. Would you agree that we must face the fact that the day the Federal Government finds it necessary to move into this field and make a Federal no-fault law, that same day we certainly would have to move in on the other bill that we had last session concerning insolvencies and the Federal Insurance Guarantee Corp?

In other words, the Federal Government would move into federally regulated insurance regardless of what the States had done and were trying to do.

Secretary VOLPE. It would certainly draw that day much closer, sir.

Senator COTTON. Thank you.

The CHAIRMAN. Well, I think the record ought to show, too, that you say the States very clearly moved off dead center and would appear to be achieving some momentum but you couldn't have made that statement a year ago.

Secretary VOLPE. That is right, sir.

The CHAIRMAN. You know why they are doing it, don't you?

Secretary VOLPE. I think so.

The CHAIRMAN. They are doing it because we have been at them.

Secretary VOLPE. That helps, Mr. Chairman.

The CHAIRMAN. Yes. Take the insurance commissioners. Senator Cotton and I had an experience with them on the insolvency proposals. They wanted State action similar to this and we have waited a long time, haven't we; and it has not happened yet.

Senator COTTON. Well, my State has been pretty good.

The CHAIRMAN. Yes; but they did want us to keep the bill going and keep the pressure on. That will be helpful. So we have to consider a reverse position here such as passing some Federal regulations which say to the States: When you achieve a certain level of performance then you are out from under. But until you do it, the Federal law is going to apply.

We have done that with some laws. I do not know how that would work as a practical matter here.

Then we have to deal with the insurance commissioners in most States. In many of the States they are elected, not appointed.

All right. Senator Hart.

Senator HART. Thank you.

Mr. Secretary, Senator Cotton was talking about his early experience with a jury. You are on notice that two of the jurors up here already have reached our conclusions which sort of destroys zip on any questions I might have, but I will ask them anyway.

I refer to the statement of Senator Magnuson that "Senator Hart and I made our position quite clear that a national no-fault approach is needed and it is needed now."

I have read—not as carefully as I intended—the document that you have filed with us, the report, oral summary of which, or highlights of which you have just given us. I will go back and read it again. But I think most of the questions that you leave unanswered in your oral testimony are answered in the document. So I hope all of us will read the document.

I will make an opening observation here and insist that you not respond.

Secretary VOLPE. I hope the temptation is not too great, Senator.

Senator HART. I am reminded of a quarterback who had about 30 seconds left in the fourth quarter; he is fourth and goal on the 2, 6 points behind, and he knows what play to call. But the coach sends in another signal and he does not call the play he knows will work.

Secretary VOLPE. I won't be tempted, Senator.

Senator COTTON. That is the quarterback that sustained personal injuries. [Laughter.]

Senator HART. That is a quarterback who performs in protection of his scholarship.

Secretary VOLPE. I am not on a scholarship, Senator. Nor do I, thank God, need one.

Senator HART. No; I realize that.

Now, we have been sitting here about an hour, a little more than an hour. In that period of time there have been 2,300 automobile accidents. There have been 500 personal injuries. Fifty-six of those personal injuries are serious, and seven have been killed. What is the difference whether it occurred in Michigan or Massachusetts, first of all? What is the difference? To put it more extreme: Wyoming or Idaho or New York or California?

Secretary VOLPE. If a person is killed, as you and I know, it is a human life lost, no matter where he is killed.

Senator HART. If there is a need for hospitalization, there is a hospital bed either place and, if there is a loss of income, it occurs either or any place.

Secretary VOLPE. Right.

Senator HART. What is the philosophy we are talking about here? You said in answer to a question earlier, you said it was a question of whether you wanted to move on a Federal no-fault now, or a question of dictating to the States. I would suggest that it is an assumption of responsibility which is ours in view of the record here—ours meaning the Federal Government. Would you care to comment on that?

Secretary VOLPE. Yes, sir. I can only say, sir, that the science of the subject that we have been discussing today is only now becoming very well or widely understood. I have had many battles in this area with people who are very close to me, and I have overridden their suggestions or recommendations because I believed, as a result of my experiences and as a result of reviewing the records that were shown to me in my own State, that there ought to be a better way to run a railroad than it was being run in Massachusetts, insofar as automobile accident insurance was concerned.

On the other hand, I think, if we are to preserve in this Nation "federalism," the Federal-State partnership, that unless the States refuse to act that we should do everything we can to preserve that Federal-State partnership, to provide the guidance and leadership to them to act and then if they refuse to act, use the stick if that is necessary and do everything possible in between to bring about a solution without waiting for additional thousands to be killed, or additional thousands to be injured.

The fact is that we are approaching this problem not on one front alone, as I am sure you are probably aware, Senator Hart. We are approaching the problem of crash losses in our highway safety program with a tremendous thrust insofar as alcohol countermeasures programs are concerned.

Fifty percent of the auto accident deaths in this Nation come from that one source. We believe that source is a very rich one for us to try to get rewarding results from. That is why we are attacking that problem as seriously and as fully as we can.

I still cannot help but believe that we do not have final answers as to the best way to go insofar as the no-fault system is concerned, even though you and I can agree completely that there is a need for change, and the no-fault approach appears to be the best avenue for change.

Senator HART. Well, I read your report and indeed got the impression from your oral presentation that with respect to what I think you call stage one, namely, medical and rehabilitation costs and some income protection, that you do know or that you do agree that no-fault is the answer; the stage two, the extending more fully of income protection; and stage three, the property-damage thing, there is less certainty or clarity. But with respect to the need for no-fault for medical expenses and rehabilitation cost and some income insurance I take it no-fault is nailed down as the answer. It is required.

You say in your report that if Congress passes this resolution and if the Council of State governments cranks up, a period of perhaps 5 years seems reasonable, at which time we will find, through the action of 50 State legislatures, national no-fault in this stage one area.

Secretary VOLPE. I would only disagree, Senator, with the 5-year period. I will not disagree with the 5 years insofar as all 50 States are concerned. I would say I would think—having served as president of the Council of State governments, that they could come up with a piece of model legislation in perhaps as little as a year. With the pressures that are building up with the increasing costs, I think we will see a substantial number of these States that will adopt legislation particularly as the results come in from the first States that do this. For instance, in Massachusetts, which will complete a full year this December you will not have just theoretical or problematical answers, you will have actual experience on which a Governor can go before a legislature and say:

I am not talking about theory; I am talking about what actually happened, and this is how much the cost of insurance went down in the State of Massachusetts.

Senator HART. I reopened hearings on this subject in the Antitrust Committee just 5 years ago. And what progress—well, we get a lot more attention, but it is still very much in the discussion stage for those 2,300 people that were involved in accidents in the last hour.

Your report suggests 5 years as a reasonable but admittedly a very tentative projection. What do you say to the 500,000 that will be seriously injured each of those years? Do I say, well, I passed a resolution? Which is why I will continue to be—I assume it will sound heavy-handed, but I will be anxious to insure that we do that which is most likely to give those people the kind of protection that you and I and all of us agree ought to be made available.

The track record in the State legislatures for adoption of model laws, even when nobody is against them, is depressing. The model traffic code, we began to try to sell that in 1934 and we are still selling it, and I do not know anybody who is against it. Certainly no organized segment of the bar. It has the support of the entire insurance industry. Here is 1971 and we are still trying to sell that.

Secretary VOLPE. I would submit, if I may, Senator Hart, that there are other areas, however, where the States have acted, although not as quickly perhaps as you and I would like to see. But you take the National Driver Register, I had to push and push awfully hard, but I finally got my State to join that. All 50 States have now joined it and they see the wisdom of it and the benefits deriving from it.

Senator HART. I will quote a State letter to indicate why some of us have less optimism than even a 5-year period, notwithstanding a public concern and interest, notwithstanding that one State in 50 now has a limited no-fault plan on the books. And one territory, Puerto Rico, where I think you get some answers to some of the questions you raise.

But in any event, here is an Illinois State representative, Anthony Scariano. He sponsored no-fault bills in Illinois, a series of them, and they have all died. He is quoted in this way:

As long as you have a statehouse full of lawyers and insurance men you are not going to have no-fault insurance in your State and that is as certain as the next accident.

Now, this is harsh, I know. But I think one could find some indication of a basis for his comment without even doing a Ph. D. dissertation on the subject of how State legislatures work in this area. How are you going to overcome that resistance? Does this resolution help, do you think?

Secretary VOLPE. I think the resolution would help, sir. I think we have in Massachusetts, and I do not like to use my State particularly, but it just so happens that it is the State that has taken some action first and I think, if I remember correctly, we have as large a percentage of insurance agents, brokers, et cetera, as well as lawyers in the Massachusetts Legislature as there are in any other legislature in the Nation.

It took some time, a lot of pressure, and a lot of hard work on the part of people. The bill came not because it was introduced in one year but because of a lot of work that was done over the course of years and finally it was passed.

Senator HART. I know you put a lot of time in it and the goal—the ultimate goal is the desirable one. But the Massachusetts bill is really an agent's bill with a label "no fault." It takes care of all the small nuisance claims on the first-party basis because it cuts off at \$2,000. Isn't that the figure?

Secretary VOLPE. Yes.

Senator HART. It saves carefully the tort system for the juicy ones. The seriously injured are items on the dockets that pile up for years if they have not been pressured into taking a settlement sooner. So that notwithstanding the energy involved in even getting that much, I think that rather tends to support the view of those of us who would be very pessimistic that the passage of a congressional resolution, a prayer, and good work and time, all of that going on, would give us the action in sufficiently short time as to justify us saying to those who will be injured and killed in the meantime, we are sorry, there is a concept of federalism involved and we are doing the best we can.

That did not hang the President up in recommending that the Federal Government regulate the health insurance field. He said there is a crisis and we have to move in. I would hope it will not hang us up, because the same description is applicable to this area.

I have other questions, but I will pass.

Senator COTTON. Mr. Chairman, I have to go back to the Appropriations Subcommittee. I would like to request that in view of all this discussion that the record of this hearing be held open for perhaps a week, if the Chairman is willing, to afford the Secretary an opportunity to file anything further he might want.

The CHAIRMAN. Without objection.

Senator HART. If I might reserve the right to file in writing these additional questions to which responses can be made, I will do that.

The CHAIRMAN. Yes.

Senator BAKER. Mr. Chairman, I know the hour is late, and I won't take long, but I want to make a preliminary remark or two that I think will set the stage for the few questions I would like to ask the Secretary.

I have a high regard for our distinguished colleague from Michigan; and I am glad he set the stage by pointing out this proceeding is in no way a judicial one, and we don't purport to sit as jurors.

I think it is probably a safe statement, however, to estimate that, just as Senator Hart has expressed a low opinion of the State legislatures of the country, both of us have been in contact with enough of our colleagues in State houses and State senates, to know that they have about the same opinion of us as we have of them.

Also, I am mindful of the fact that there is a genuine concern on the part of the Senator from Michigan and I think of all the members of this committee and the Senate to provide compassionately for those who are injured in automobile accidents, or whose lives are forfeited because of negligence or fortuitous circumstances on the highway, whatever happens to be the case.

But I caution we ought not to confuse the desirability, or lack of it, of changing the tort system with our instinct for self-preservation.

Whatever we do, this resolution may or may not have something to do with the death toll and the number that are maimed and injured on our highways. But if it does, the chances are the passage of a no-fault system would make the matter worse, instead of better.

I express no opinion on my support or opposition to your resolution, Mr. Secretary, or the concept of no-fault insurance at this point. But I hazard the observation that the negligence system, grounded in the common law, complete with its concept of special damages or com-

pensatory damages and punitive damages, is not only calculated to compensate for injuries or death or property damage, but also to defer and provide a disincentive for those who drive automobiles to act recklessly. Evidence the number of punitive damage verdicts and judgments that are awarded in this country on both the State and Federal judicial system.

I have only this additional comment now by way of prolog. What this committee is seeing today, in the accident statistics quoted by the distinguished Senator from Michigan and by others and in your comments and recommendations to this committee, is a sad, sad commentary on the failure of the judicial system in the United States of America.

Because what we are seeing is inequity run rampant in automobile personal injury cases and in some property damage cases. Now we are called upon to change that system, the negligence system, the tort system and go to a system of level response and damages such as workmen's compensation instead.

Now there is some lawyer left in me after my 5 years in the Senate. Not much and maybe not very good, but there is some, and that impels me to suggest that the fault system, that the negligence and tort system is not all that bad. Its execution has been extraordinarily poor and maybe I will be forgiven for hazarding the estimate that if the judiciary in the United States would stop trying to act like legislatures and start acting like the judiciary in trying lawsuits and interpreting law, maybe the legislatures would stop trying to act like the judiciary and start acting like the legislature.

We have here a conflict in our responsibility to provide for the welfare of the people that ride the highways and travel and those that do not, but are affected by that activity on the one hand, and the principles of reparations and compensation on the other.

I suggest in this preliminary statement that we caution ourselves to observe that no-fault insurance, or a no-fault system is not necessarily synonymous with a reduction in the death and injury total on the Nation's highways, nor is it necessarily better. It depends entirely on its implementation.

I suggest that if the Senator from Michigan or I were involved in an automobile accident, and God forbid, he or I were totally disabled and unconscious for the remaining portion of our life expectancy, it might be a difficult burden to bear for our families to know that there is a limited amount of compensation they could receive.

Senator HART. I would ask the Senator to read the Magnuson and Hart bill. It isn't a little, either.

Senator BAKER. Well, I am making an analogy with the workmen's compensation system.

Senator HART. I am glad you made clear it is not analogous in the Magnuson-Hart bill.

Senator BAKER. I will conclude these remarks briefly, and the Senator and I can have a further conference. But I would ask the Secretary to provide for the record, his commentary and those of his staff on these points. One is jurisdiction of this committee. I expect we do have jurisdiction and I expect it is not appropriate for you to comment on it, but we are dealing with such a fundamental point

in the body of the generic law that it seems to me we, at least, need to coordinate with the Committee on the Judiciary.

Item two, whether or not this is consistent with the policy enunciated in your proposed joint resolution or any legislation that might flow from it, the concept of responsibility for negligence or punitive damages as well as the no-fault concept.

Item three, whether or not this would be implemented in the State courts as well as in the Federal courts, and if so, what further changes would be necessary in the Federal judicial code or the Federal rules of civil procedure, particularly that relating to diversity of citizenship, which confers jurisdiction on the Federal judiciary.

And last, whether or not, and I think there isn't but whether or not there is any remaining residual of doubt in your minds as to whether this Congress, under these circumstances, is tinkering with the due process clause of the Federal Constitution or the rights of an individual citizen to limit the amount of his recovery.

The comments on those questions can be supplied for the after-file record, Mr. Chairman.

I won't delay these proceedings further at this time.

Secretary VOLPE. We will be happy to supply them, Senator.

(The following information was subsequently submitted by the Department of Transportation in response to the four "Items" or questions posed by Senator Baker:)

Item 1. With respect to the jurisdiction of the Commerce Committee referable to the Administration's proposed Concurrent Resolution, we feel this issue is subject entirely to the legislative prerogative and wish to express no opinion on this subject.

Item 2. In connection with the question whether no-fault automobile reparations systems would be inconsistent with amenability of the motorist to punitive damages for willful, wanton or other flagrant misconduct, it would seem that under such a system the theme of liability for punitive or exemplary damages could easily be preserved. However, any such retention of a cause of action for punitive damages should be accompanied by a clear statement of public policy to the effect that no motorist could purchase, nor any insurer sell, insurance protecting such motorist from his liability for exemplary damages, i.e., damages which do not have as their purpose the compensation of the injured party but rather are for punishing the wrongdoer and deterring him and others from the type of misconduct leading to the imposition of punitive damages.

While, admittedly, the courts are divided on the issue, it is felt that the better rule even today is that it is against public policy to permit an automobile liability insurance policy to insulate the insured from his liability for punitive damages where such damages are predicated upon the objectives of punishment and deterrence rather than upon compensation of the innocent victim's injuries. It is quite obvious that where automobile liability insurance is permitted to cover the exemplary damages and those damages are included in the loss experience, upon which insurance rates are made, the general insuring public is the recipient of the punishment intended for the wrongdoer who, himself, is thereby insulated from the financial consequences of his flagrant misconduct and any deterrent propensities of punitive damages are thereby lost.

What would seem to be the better rule can be found in the court's holding in *Northwestern National Casualty Co. v. McNulty*, 307 F. 2d 432 (USCA-5-1962) that both the public policy of Virginia (where the policy was sold) and Florida (where the accident occurred) prohibited insurance against liability for punitive damages.

"The policy considerations in a State where, as in Florida and Virginia, punitive damages are awarded for punishment and deterrence, would seem to require that the damages rest ultimately as well as nominally on the party responsible for the wrong. If that person were permitted to shift the burden to an insurance company, punitive damages would serve no useful purpose. Such damages do not compensate the plaintiff for his injury since compensatory damages have

already made the plaintiff whole. And there is no point in punishing the insurance company; it has done no wrong. In actual fact, of course, and considering the extent to which the public is insured, the burden would ultimately come to rest not on the insurance companies but on the public, since the added liability to the insurance companies would be passed along to the premium payers. Society would then be punishing itself for the wrong committed by the insured . . . [T]he delinquent driver must not be allowed to receive a windfall at the expense of the purchasers of insurance, transferring his responsibility for punitive damages to the very people—the driving public—to whom he is a menace.”

Indubitably, it was considerations of this sort which impelled Senator Jack Davies to include in his proposed Minnesota no-fault auto insurance a section providing: “A person injured by the grossly negligent driving of another may recover punitive damages from the grossly negligent driver. No insurer may contract to indemnify for punitive damages awarded under this subdivision. A principal is not liable under this subdivision for the grossly negligent driving of his agent.” In a law review article (“The Minnesota Proposal for No-Fault Auto Insurance,” 54 Minnesota Law Review No. 5, p. 921) Senator Davies explained his reasons for making this proposal:

“This subdivision was conceived as I reflected upon the fallacious representations by foes of no-fault that the present system works as a fault liability system. The fact is that we have an insurance system. Typical of the repetitious assertions by opponents of no-fault is the following: ‘We believe that one who is injured through the carelessness of another should be compensated by the person who was responsible for causing the injury.’

“That statement is a misrepresentation of how the present system works. Less than three percent of those ‘responsible for causing the injury’ now pay anything to the injured person. Payment, if any, is made by insurance companies. If no-fault opponents really believe in a fault system where bad drivers pay victims, they should favor this bill over the present system. This subdivision allows the harmed to pursue the wrongdoer and to extract from the wrongdoer whatever flesh a jury will allow. But the jury will know the pursuer already has been reasonably compensated for his injuries and that in his action under this subdivision he seeks to punish. If punishment has a place in our compensation system, this bill provides for it. The present tort-liability insurance system does not.”

Although the concept of preserving to the wronged individual the right to recover punitive damages against which the wrongdoer may not insure himself has considerable attraction, it would appear that rather than permit the wronged person to effect redundant recovery, the tort-fine system might be so employed as to direct the proceeds from punitive damage recoveries toward public purposes, perhaps highway safety, to the extent that such recoveries exceed the costs of litigation, including reasonable attorneys’ fees.

Item 3. In view of the fact that no-fault reform, as contemplated in the Concurrent Resolution, would be effected by the States themselves, judicial implementation of such systems would be primarily by the State courts. Thus, further changes in the Federal judicial code or the Federal rules of civil procedure are not presently foreseen.

Under a no-fault, first-party automobile insurance system, the insured accident victim might well be in a position to proceed against the insurer in the Federal courts where the requisite diversity of citizenship existed and the amount in controversy was sufficient to confer jurisdiction upon the Federal courts. On the whole, however, it seems likely that under State legislated no-fault auto accident reparations systems, the number of diversity cases arising out of automobile accidents would be less than those reaching the Federal courts under the present tort-liability insurance auto accident reparations systems.

Item 4. It will be recalled that the Automobile Insurance and Compensation Study commissioned three eminent constitutional law scholars to engage in research and report on constitutional problems which might be involved in the interface of no-fault automobile reparations systems with the Federal Constitution. In the individual papers comprising the research report, *Constitutional Problems in Automobile Accident Compensation Reform*, Dean Lindsey Cowan of the University of Georgia Law School and Professor Joseph W. Bishop, Jr., of Yale University Law School addressed themselves to the question whether State enacted no-fault systems would conflict with the Federal Constitution while Professor C. Dallas Sands of the University of Alabama Law School dealt with

the constitutional law issues that might be involved incident to reform of the reparations system through Federal legislation.

As a result of his study, Dean Cowan concluded: "... [O]n the basis of such information as is available, it seems reasonable to predict that for the foreseeable future at least, the United States Supreme Court will hold that the 'no-fault' plans for the allocation of the costs of automobile accidents do not violate the due process and equal protection clauses of the Fourteenth Amendment." Similarly, Professor Bishop has written: "... I am of the opinion that a State statute enacting the Basic Protection [Keeton-O'Connell Plan] or some variant thereof would not contravene the Constitution of the United States."

Of due process questions, Professor Sands has written:

"Unless one is to assume that the common law is constitutionally immune from change, it is hard to take seriously questions that might be raised under the rubric of substantive due process on grounds of unreasonableness of legislation to reform the automobile accident loss compensation system . . .

"Although the principle of equality surely applies with no less force, nor differently, to federal than to state action despite the absence of an equal protection clause from the Bill of Rights, there is no greater substance to the argument that equal protection is violated by treating amounts of economic loss over a certain amount differently than claims for other kinds of losses, as the Keeton-O'Connell plan does, since reasonable leeway for legislative classification has been so clearly acknowledged by now. Indeed, the present tort system arguably results in a greater denial of equal protection by overcompensating small claimants and undercompensating large claimants, than would the proposals for reform. One of the purposes of such proposals is precisely to achieve greater proximity to equality of treatment among all victims of automobile accident."

Senator HART. I repeat again, the verdict as I have had my chairman announce it on my part is based on hearings for me that began in 1967. I get even more dug in as I listen.

Senator BAKER. Will the Senator yield?

I understand that and I understand the enthusiasm with which he approaches this subject, but my overall caution is that the advocates of no-fault or the opponents of it neither become so inflexible and dogmatic in the pursuit of their objective that we lose sight of the fact that there is good and bad in both concepts.

Senator HART. Well, perfection is not to be found in the products of man's hand. I accept that principle. But after you establish that, you then get into the area of degree and I publicly plead guilty in concluding that there isn't very much argument as to the degree, and I read the Secretary's report as an agreement with that conclusion. I am not talking about the testimony, I am talking about the report.

The Senator from Indiana?

Senator HARTKE. Well, I don't know who is at fault for that. Let me ask you, is the administration committed to a first-party, no-fault system?

Secretary VOLPE. Yes.

Senator HARTKE. Is it committed to it as a matter of national policy.

Secretary VOLPE. Insofar as we have related it here to action by the States and not a Federal statute, yes.

Senator HARTKE. But you do not believe that the Federal Government should act in this field and preserve the field now. That is what you are saying, is that right?

Secretary VOLPE. Yes.

Senator HARTKE. Would the administration veto such a bill if it were passed?

Secretary VOLPE. I don't know.

Senator HARTKE. I have to admit, whether you are for no-fault or opposed to it, I cannot understand how you can be committed to a

policy on a national level and be against it at the same time. I have to admit that baffles me. I know the hour is late and I don't think anything is going to be solved by asking any further question about it, but I honestly say that this approach in my way is no way to run a railroad or legislation.

I will let it go at that.

The CHAIRMAN. Any further questions?

We thank you, Mr. Secretary, and again I want to express for the committee our deep appreciation to your staff for this very complex job. We are very pleased with it.

Secretary VOLPE. Thank you.

(The questions of Senator Hart and Secretary Volpe's answers follow.)

U. S. SENATE,  
COMMITTEE ON THE JUDICIARY,  
Washington, D.C., March 26, 1971.

HON. JOHN A. VOLPE,  
Secretary, Department of Transportation,  
Washington, D.C.

DEAR MR. SECRETARY: In order to complete the record made when you appeared before the Senate Commerce Committee on March 18, 1971, we would appreciate your furnishing for the record responses to the following:

In your testimony you state that "every owner of a motor vehicle should be required to carry insurance . . ." Yet, nowhere in your prepared statement or oral testimony did you mention the very serious problem of auto insurance cancellations and nonrenewals.

What is the Administration's position in this regard?

Are we going to "require" car owners to carry insurance, and still leave insurance companies free to write some and not others as they see fit?

Mr. Colston Warne, President of Consumers Union, who is also chairman of your Auto Compensation Study's Consumer Advisory Committee, believes that 14 objectives should be met by any auto insurance reform plan. One such objective is: A standardized driver-rating system with premium rates figured in a way that would enable easy price comparisons, including comparison of the relative claim-paying practices of each company.

What is the Administration's position on this?

In your statement do we understand you to say that auto insurance coverages for medical and rehabilitation expenses should be "primary as among private systems"?

Why should these coverages be "required" as the "primary" source of indemnity for auto accident injuries?

What is the Administration's position with respect to auto insurance being primary as among public systems, such as Social Security and proposed National Health Insurance?

If auto insurance is to be primary as among private or public systems, doesn't that mean that consumers will continue to pay (either in premiums or taxes) for the same kind of duplicate coverage for which they are now paying?

If auto insurance is to be the primary source of recovery, how does the Administration propose to coordinate the premiums and taxes the car owner pays out to the numerous private and public systems covering the same expenses?

You also state that, "payment of benefits by a carrier under their (medical and rehabilitation) coverage should automatically remove the obligation of any other insurance carrier to pay benefits to the extent that the costs are covered by automobile insurance," how does the Administration propose to assure that consumers will realize lower premium rates from the "other insurance carrier" whose obligation to pay benefits would be automatically removed?

As the Administration suggests in the proposed Concurrent Resolution, assume that Congress decides to wait an additional 25 months to see how reform is proceeding at the state level. Is it to be inferred from your testimony and Report that the Administration will not accept reform which is anything less than a state law which provides no-fault coverage for all medical, hospital and rehabilitation expenses, all lost wages up to a limit of \$1,000 a month for 36 months,

and all lost service benefits up to a limit of \$75 per week for approximately 36 months?

In your testimony you say "there are 21 states in which bills have been introduced in one or another calling for some type of no-fault insurance."

Please describe briefly the medical, hospital, rehabilitation, lost wages and service benefits provided in the so-called no-fault bills proposed in each of these 21 states.

In which states do the introduced bills meet the uniform no-fault state law, which is described in the Administration's proposed Concurrent Resolution?

In which states do the introduced bills fail to meet your recommendations in such Resolution?

In your opinion, how do the so-called no-fault plans being sponsored by the Defense Research Institute, Independent Agents Association, and National Association of Independent Insurers in New Jersey, Pennsylvania, Michigan and other states meet the no-fault coverage recommendations described in your prepared statement, testimony, Report and proposed Concurrent Resolution?

You also state that "The problems are quite different in New York and Massachusetts, than they might be in Wyoming or Idaho."

To what "problems" are you referring?

The study, Automobile Personal Injury Claims, done for your Department by 16 of the leading auto insurance writers, states as follows:

*"Although the claims in this study were limited to those arising from accidents in the 19 states sampled, residents of every one of the 50 states and the District of Columbia were represented among the claimants—striking evidence of the interstate nature of the automobile accident compensation problem. Implementation of change in the compensation system must contend with this pervasive characteristic of car crashes. Further complicating the achievement of significant change on a state-by-state basis is the fact that the accidents in these 19 states involved insured vehicles registered in every state except Hawaii."*

Do you agree that the automobile accident compensation problem is interstate in nature?

Would you please explain exactly what you mean by the following statement:

*"... the inherent 'fairness' of using loss exposure as a major factor in pricing insurance to the individual."*

In the study, Causation, Culpability and Deterrence in Highway Crashes, published by your Department in 1970, the following source is referred to:

*"Klein, D. A critique of Lawton's 'Psychological Aspects of the Fault System,' U.S. Department of Transportation, 1970."*

As we have never received copies of this study, would you please furnish us with some as soon as possible?

During the hearing, as the Administration spokesman, you indicated that reform should be sought on the state level. Despite our difference of opinion on this particular issue, I wish to commend you and your staff for the excellent job that you have done with respect to this study.

Sincerely,

PHILIP A. HART,  
Chairman,  
Antitrust and Monopoly Subcommittee.

---

OFFICE OF THE SECRETARY OF TRANSPORTATION,  
Washington, D.C., June 18, 1971.

HON. PHILIP A. HART,  
U.S. Senate,  
Washington, D.C.

DEAR SENATOR HART: Secretary Volpe has asked me to reply to your request for responses to certain additional questions for purposes of completing the Senate Commerce Committee's record of March 18, 1971. The questions and our responses follow:

*Question 1. In your testimony you state that "every owner of a motor vehicle should be required to carry insurance. . . ." Yet, nowhere in your prepared statement or oral testimony did you mention the very serious problem of auto insurance cancellations and nonrenewals.*

*What is the Administration's position in this regard?*

*Are we going to "require" car owners to carry insurance, and still leave insurance companies free to write some and not others as they see fit?*

Response 1. With respect to cancellations and nonrenewals, several of the Insurance Study's published research reports, including the one prepared by the Federal Trade Commission, *Insurance Accessibility for the Hard-to-Place Driver*, examine the existing problems of cancellation and nonrenewal under the present insured tort liability system. A shift from a third-party fault to a first-party no-fault system should markedly change the nature of the residual market. Availability of coverage should, in general, improve because total loss exposure can be more accurately predicted. Ability-to-pay problems should also be reduced because loss exposure will become significantly dependent upon the insured's own loss potential characteristics, including his income level. Thus, the present problems of cancellation and nonrenewal should be substantially reduced when the States enact legislation encompassing the Department of Transportation's recommendations.

The States, themselves, have been quite active in attempts to deal with current residual market problems. Under the more favorable underwriting climate expected to be provided by a first-party, no-fault reparations plan, the States should be able to provide adequate solutions to any remaining want of a voluntary market.

The question of leaving some companies free to write policies for some applicants and not others is an important one. A first-party automobile insurance system for the reparation of automobile accident victims would have to be compulsory, it is generally agreed, not only because of the interests of others, such as pedestrians and otherwise uninsured occupants of vehicles, but also because there are some (fortunately, only a very few) who are so completely irresponsible as to be oblivious of the need for their own protection and that of their families. To that extent, therefore, car owners would be "required" to carry insurance.

However, because the principal and direct beneficiaries of the insurance would be the motorists themselves and their families, it is difficult to believe that the same type and degree of compulsion would be required under a first-party system as is now required under the third-party, liability insurance reparations system.

Similarly, it is difficult to believe that the same type of underwriting restrictions as those now widely prevalent under the tort reparations system would be characteristic under the first-party system. Under the liability insurance system, the underwriter has no way of knowing whether a possible accident victim, to be compensated under the policy, will be one whose modest income and low standard of living militate against great dollar loss or whether such victim will be one whose economic status will entail great loss incident to his injury and disablement. Given a first-party system, however, the underwriter will be in a better position to determine more precisely the probable range of loss in the event of accident simply because he will have information regarding the economic status of the insured and his family. Moreover, since the ability or inability of the insurer successfully to defend the insured in a tort suit will determine neither the fact nor the extent of the insurer's liability, the defendability of the insured should not assume a paramount, if any, role in determining the acceptability or retention of an individual risk or of any class or group of risks.

Under these circumstances, one would expect that those risks which have been most suspect and, therefore, most shunned under the third-party system (such as, for example, youthful drivers, the elderly, and ghetto dwellers) should find decidedly improved acceptance under a first-party system, from which it should follow that the underwriting and market problems referable to a first-party system will differ from those which have typified the third-party system and will demand different solutions.

There is little reason to believe that the accident prone, the abuser of alcohol and the irresponsible driver will not experience difficulty in obtaining or retaining coverage under a first-party system, but there is every reason to believe that motorists whose own records are unmarred by accidents or violations will not be consigned to assigned risk plans without cause. It is readily apparent that an assigned risk plan appropriate to the first-mentioned types of risk will, and should, differ markedly from an assigned risk plan necessitated by the inability of large numbers of the second type of risk to procure insurance in the voluntary market.

Clearly, assigned risk plans affording coverage to those in good faith entitled to, but unable to obtain, insurance should be as universal under a first-party system as they are now under the liability system, but such plans should relate to the conditions presented by the new system rather than to the conditions which characterized the old. Similarly, if restrictions and limitations upon cancellation or nonrenewal are required under the new, first-party system, they should be relevant to, and necessitated by, the new system rather than represent solutions to problems rendered obsolete by the inauguration of the new reparations system.

*Question 2. Mr. Colston Warne, President of Consumers Union, who is also chairman of your Auto Compensation Study's Consumer Advisory Committee, believes that 14 objectives should be met by any auto insurance reform plan. One such objective is: A standardized driver-rating system with premium rates figured in a way that would enable easy price comparisons, including comparison of the relative claim-paying practices of each company.*

*What is the Administration's position on this?*

Response 2. Beyond doubt, a standardized driver-rating system, such as that visualized by Mr. Colston Warne, with premium rates figured in such fashion as to enable the insurance buyer easily to make price comparisons, represents an entirely worthy objective for any auto insurance reform plan. Inclusion in such a system of means for enabling the insurance purchaser to compare and evaluate the relative claim-paying practices of each insurer is no less worthy and desirable an objective. It is not improbable that attainment of the latter objective might require either standardization of policy provisions or creation of some means for enabling the lay insured to measure and evaluate variations in policy language upon which differences in claim-paying practices may be predicated. In any event, States should carefully consider the desirability and feasibility of including such features in any auto accident reparations reform they adopt.

*Question 3. In your statement do we understand you to say that auto insurance coverages for medical and rehabilitation expenses should be "primary as among private systems"?*

*Why should these coverages be "required" as the "primary" source of indemnity for auto accident injuries?*

*What is the Administration's position with respect to auto insurance being primary as among public systems, such as Social Security and proposed National Health Insurance?*

*If auto insurance is to be primary as among private or public systems, doesn't that mean that consumers will continue to pay (either in premiums or taxes) for the same kind of duplicate coverage for which they are now paying?*

*If auto insurance is to be the primary source of recovery, how does the Administration propose to coordinate the premiums and taxes the car owner pays out to the numerous private and public systems covering the same expenses?*

*If, as you say at page 13 of the transcript, "payment of benefits by a carrier under their (medical and rehabilitation) coverage should automatically remove the obligation of any other insurance carrier to pay benefits to the extent that the costs are covered by automobile insurance," how does the Administration propose to assure that consumers will realize lower premium rates from the "other insurance carrier" whose obligation to pay benefits would be automatically removed?*

Response 3: There appears to be virtual unanimity of opinion that any first-party auto accident reparations system must be predicated upon compulsory insurance. To that extent, then, the auto medical and rehabilitation expense coverage would be "required."

The Department's report, "Motor Vehicle Crash Losses and Their Compensation in the United States," attempts to make clear the belief that a wide range of deductibles should be made available to the insured to the end that he might mesh his automobile insurance program with his other insurance and benefit programs and pay the reduced auto insurance premium appropriate to the deductible selected by him.

It would seem to be clear that the insurer with knowledge that the first \$100, \$250 or \$1,000 of loss will not be covered will be in a position to adjust the premium rate downward with some precision just as the collision or homeowners insurer accords its insured a lesser rate commensurate with the deductible chosen by him. This approach has the considerable virtue of affording the insured

premium savings on an anticipatory basis based upon the impact of his risk upon the expected loss experience.

The alternative would be to require all automobile policies to provide that the coverage would constitute only excess insurance over other health insurance, Blue Cross or other benefit programs.

Even if one were to overlook the considerable, if not prohibitive, administrative expense incident to rating each automobile risk individually and conferring upon each risk a rate appropriate to the other coverage then possessed by the insured which would constitute a primary coverage in the event of loss, it would appear to be necessary to condition the coverage of that policy upon the continued existence of the other insurance on which the rate was predicated. Thus, if the insured's personal situation were to change, as, for example, where he changed jobs and no longer enjoyed the group accident and health coverage which he formerly had available to him, he might find himself without any coverage because of a warranty in his policy regarding the existence of other coverages. Again, other insurers, such as accident and health insurers, or other providers of benefits, might well alter their coverages so as to delete benefits for loss arising out of auto accidents, or make their coverages excess so as to place the insured in the impossible position of having two or more benefit sources each of which purports to be excess with each provider of benefits declining to respond until the other has paid its benefits; an unfortunately familiar situation when conflicting excess clauses are involved in connection with an insurance loss.

If first-party auto insurance policies are not individually rated so as to credit the insured's premium with the other, primary, insurance available to him, then, the only rate relief which can come to auto policyholders by reason of making benefits provided by health insurance of plans primary must come through the lowering of the general rate level by reason of the impact of other insurance upon the general loss experience. However, any such lowering of the general rate level will necessarily inure as much to the benefit of those who are without other coverage, and who will, consequently, receive full reparation from the auto insurance system, as to the benefit of those who receive, and pay for, protection from other benefit sources. In short, auto policyholders with other health coverage would subsidize those without other coverage to a significant extent.

It must never be forgotten that insurance rates are addressed to the future and that past loss experience is relevant only to the extent that future experience can be expected to duplicate the past experience. The auto insurance actuary peering into the future for the purpose of structuring his rates can be expected to view pessimistically the likelihood that future auto losses will be softened to the same or greater extent by the presence of other insurance as in the past, particularly when it lies within the power of other insurers or providers of benefits to terminate the relevancy of their coverage by excluding auto accidents from its scope or by rendering such coverage excess insurance.

Moreover, if the only rate benefit arising out of constituting other insurance as the primary coverage lies in reducing the general rate level because of the impact of the other insurance on the common loss experience, we are concerned that a new breed of preferred risk underwriters may arise vying only for those risks most likely to enjoy the other coverages which will be primary in the event of loss and thus most calculated to yield the greatest profit under a rate level determined by risks without other insurance as well as risks having other coverage. Warranties in policies, policy conditions entailing forfeiture incident to breach, and other coverage devices could be confidently expected to follow in the wake of such preferred risk underwriting. Should such conditions eventuate, we shall have but substituted one form of "skimming the cream" for another and one class of residual or substandard risk for another.

In sum, the better approach would seem to be to allow the insured to maximize the premium benefit to himself resulting from other coverage which he may have or arising out of his willingness and ability to absorb small losses is to make available to the insured a full range and variety of deductibles to the end that the lay insured may, with full cognizance of what he is doing, realize directly and immediately the premium savings justified and demanded by the other coverage which he possesses. Although from a public policy perspective any duplication of benefits is clearly undesirable and the widest coordination of benefits is a sound goal, premiums, as well as benefits, should be "coordinated." The safest and surest way to accomplish this would appear to lie in providing a wide variety of optional deductibles.

With respect to public systems such as Social Security or proposed National Health Insurance, several factors must be considered in deciding which insurance should provide primary coverage including: (1) the possibility of leaving some individuals uninsured or creating coverage gaps; (2) the confidence with which the secondary insurer can predict whether primary insurance will be available when the accident occurs; and (3) the administrative cost effectiveness of the primary insurance.

Social Security should be primary over automobile insurance because it is compulsory for most eligible employees; therefore, there will be no unintended gaps in coverages. Automobile insurers can be confident because Social Security is compulsory, that the primary coverage will be available at the time of the accident; they will be able to base their rates on this fact; and Social Security has a better cost benefit ratio than automobile insurance.

The question of primacy of coverage with respect to "national health insurance" and automobile insurance is, at present, moot and should probably remain so until several questions are resolved, including: (1) to what extent will either type of insurance be compulsory; (2) will "national health insurance" be a government-mandated private health insurance or will it be a wholly governmental system; (3) which system will provide the more comprehensive benefits; and (4) which promises to be the most efficient? Since the answers to these questions cannot be determined at this time, the Department of Transportation recommends making automobile insurance first-party, no-fault, mandatory and primary to all other private insurance schemes.

*Question 4. As the Administration suggests in the proposed Concurrent Resolution, assume that Congress decides to wait an additional 25 months to see how reform is proceeding at the state level. Is it to be inferred from your testimony and Report that the Administration will not accept reform which is anything less than a state law which provides no-fault coverage for all medical, hospital and rehabilitation expenses, all lost wages up to a limit of \$1,000 a month for 36 months, and all lost service benefits up to a limit of \$75 per week for approximately 36 months?*

Response 4. One page 133 of the Department's final report, "Motor Vehicle Crash Losses and Their Compensation in the United States" in reference to the "Specific Recommendations" alluded to in the foregoing question, the following was noted:

"It should be emphasized that the policy limits and deductibles used in the following description are *basically illustrative*, although the Department of Transportation's study would indicate that they are roughly in the right order of magnitude."

The thrust of the Administration's position is that the States should be given significant flexibility in designing their own reform plans, with any final judgment as to their adequacy or relative effectiveness deferred until they have been tested in practice.

*Question 5. In your testimony you say "there are 21 states in which bills have been introduced calling for some type of no-fault insurance."*

*Please describe briefly the medical, hospital, rehabilitation, lost wages and service benefits provided in the so-called no-fault bills proposed in each of these 21 states.*

*In which states do the introduced bills meet the uniform no-fault state law, which is described in the Administration's proposed Concurrent Resolution?*

*In which states do the introduced bills fail to meet your recommendations in such Resolution?*

*In your opinion, how do the so-called no-fault plans being sponsored by the Defense Research Institute, Independent Agents Association, and National Association of Independent Insurers in New Jersey, Pennsylvania, Michigan and other states meet the no-fault coverage recommendations described in your prepared statement, testimony, Report and proposed Concurrent Resolution?*

Response 5. There is attached (Attachment A) a table which compares in summary fashion the principal features of the Department's recommendations for reform of the auto accident reparations system with the various reform plans before the several States legislatures this year.

Obviously, none of the various state plans are identical to the "illustrative plan" in the Department's Report. Many of these reform proposals would accomplish in part, some almost entirely, the basic goals implied in the "principles" advanced in the Report. The "Davies" bill in Minnesota is a good example of the latter.

Many of the bills, e.g. those which introduce compulsory first-party benefits (albeit usually at limits too low to insure adequate reparations for the seriously or fatally injured victims) but which retain subrogation, can be viewed as useful intermediate steps in an evolutionary reform process to the goal of a total first-party, no-fault system. The fact that these first or intermediate steps do not accomplish all desired reforms, should not be used as an argument against taking them at all.

The "so-called no-fault plans being sponsored by the Defense Research Institute, Independent Agents Association, and the National Association of Independent Insurers" are, of course, not "no-fault" plans, but rather combination first-party/tort plans, and obviously do not meet the no-fault coverage recommendations described in the Department's Report or the proposed Concurrent Resolution.

*Question 6. In your testimony you say, "The problems are quite different in New York and Massachusetts, than they might be in Wyoming or Idaho."*

*To what "problems" are you referring?*

Response 6. I would probably have been more accurate to say that "The Auto insurance needs of residents are quite different in New York and Massachusetts than they might be in Wyoming or Idaho." Thus the higher accident frequency found in the more densely populated states is certain to make insurance there relatively more expensive. In setting minimum standards for their own citizens as to mandatory insurance coverage, under a first-party no-fault system, individual states should have the prerogative of reflecting this difference.

*Question 7. The study, Automobile Personal Injury Claims, done for your Department by 16 of the leading auto insurance writers, states as follows on pages 10 and 11:*

*"Although the claims in this study were limited to those arising from accidents in the 19 states sampled, residents of every one of the 50 states and the District of Columbia were represented among the claimants—striking evidence of the interstate nature of the automobile accident compensation problem. Implementation of change in the compensation system must contend with this pervasive characteristic of car crashes. Further complicating the achievement of significant change on a state-by-state basis is the fact that the accidents in these 19 states involved insured vehicles registered in every state except Hawaii."*

*Do you agree that the automobile accident compensation problem is interstate in nature?*

Response 7. Yes, the automobile accident compensation problem is interstate in nature.

*Question 8. Would you please explain exactly what you mean by this statement: "... the inherent 'fairness' of using loss exposure as a major factor in pricing insurance to the individual."*

Response 8. The existing automobile liability insurance driver classification plans are justified on the grounds that they achieve substantial equity or fairness between various groups of drivers distinguished by the fact that they share certain "objective" characteristics. Thus, for example, drivers are classified according to age because experience has shown that the accident loss frequency and severity associated with young insureds is on a liability basis significantly higher than for the driving population as a whole. Therefore, drivers under age 25 are charged premiums for their insurance to reflect the higher loss costs which they as a group incur for the system. Other differentiations on the basis of sex, car use, mileage, residence, driver training, etc. are similarly justified in the name of fairness.

But the liability insurance driver classification system as now constituted omits from its consideration the insured's own exposure, i.e., his loss potential (or the size of his potential claim on the insurance pool as an "innocent" accident victim). In other words, the classification system does not reflect difference in the value of the driver's car, his income, the size of his family and its needs in the event of his death, etc. The result is that *regardless of their likelihood to "cause" a crash*, low income drivers as a class subsidize high income drivers, drivers with economy cars subsidize those with limousines, single drivers with no dependents subsidize family men, younger and older drivers subsidize those of middle age, etc. A hypothetical illustration may help explain how this happens.

First, assume a car population of 200 vehicles, half of them Cadillacs and half of them Chevy IIs. Their owners all have the same "objective" classification

characteristics—age, driving habits and accident/violation record, territory, etc.; therefore, under the liability insurance classification plan, they all paid the same for liability insurance, in this case \$91 per year. All owners are equally likely to have accidents and to be “at fault” in them.

There are forty accidents during the year and, since according to our assumption all drivers are equally likely to be involved and be “at fault”, ten of the accidents involve only Cadillacs, ten only Chevy IIs and 20 Cadillacs and Chevy IIs. Every accident, in the hypothetical example, is the same, a sideswipe, in which one car crosses the median line and the left front fenders of both cars are damaged so that they will have to be replaced. Labor and parts for the Cadillacs are \$612, for the Chevy IIs \$298. In every case, the innocent driver recovers his full property damage loss from the other driver's liability insurer.

Thus, despite the fact that Cadillac owners and Chevy II owners are “guilty” or “innocent” in equal numbers, Cadillac owners, who pay \$91 each in premiums or \$9,100 as a class into the insurance pool, get a total of \$12,240 back in benefits; Chevy II owners, who also pay \$91 each or \$9,100 as a class, get back only \$5,960. Thus, it is clear that the “insured” liability system cannot be “fair” to these different classes of drivers because it cannot take account of their different loss exposure, i.e., the value of the property at risk, its susceptibility to damage or its cost to repair.

	Cadillac accidents only	Chevy II accidents only	Cadillac/ Chevy II accidents	Total
<b>Number of accidents:</b>				
Cadillacs at fault.....	10		10	20
Chevy II's at fault.....		10	10	20
<b>Total.....</b>	<b>10</b>	<b>10</b>	<b>20</b>	<b>40</b>
<b>Losses:</b>				
Cadillacs at fault.....	\$6,120		\$2,980	\$9,100
Chevy II's at fault.....		\$2,980	6,120	9,100
<b>Total.....</b>	<b>6,120</b>	<b>2,980</b>	<b>9,100</b>	<b>18,200</b>
<b>Benefits accruing to—</b>				
Cadillac owners.....	6,120		6,120	12,240
Chevy II owners.....		2,980	2,980	5,960
<b>Total.....</b>	<b>6,120</b>	<b>2,980</b>	<b>9,100</b>	<b>18,200</b>
<b>Premiums:</b>				
Cadillac owners.....	( <sup>1</sup> )	( <sup>1</sup> )	( <sup>1</sup> )	9,100
Chevy II owners.....	( <sup>1</sup> )	( <sup>1</sup> )	( <sup>1</sup> )	9,100
<b>Total.....</b>	<b>(<sup>1</sup>)</b>	<b>(<sup>1</sup>)</b>	<b>(<sup>1</sup>)</b>	<b>18,200</b>

<sup>1</sup> Not available.

Under the liability insurance system, owners of popular priced cars are subsidizing the owners of more expensive luxury cars. Moreover, the subsidy effect increases for car owners at the extremes of the car value spectrum, e.g., the owner of a ten-year old Chevy or a brand new Mercedes.

The subsidization of the affluent by the less affluent can be seen in the following example:

Again we must assume a driving population of 200 car owners. Half of them are blue collar workers earning \$175 per week; the other half are business executives earning \$500 per week. All have the same “objective” classification characteristics—age, driving habits, etc. Therefore, they all pay the same bodily injury liability insurance premium, in this case \$235 per year.

Again there are forty accidents, and assuming that blue collar workers and executives are equally likely to be accident involved and “at fault,” ten would involve blue collar workers only, ten executives only, and twenty executives and blue collar workers. In each accident, the respective drivers suffer the same injury involving the same medical/hospital loss and the same amount of work time lost, two weeks. Medical costs are \$500 for all, wage loss for blue collar workers is \$350 each and for executives \$1,000 each. Each innocent victim recovers his full loss from the other driver's liability insurance.

	Blue collar accidents only	Executive accidents only	Executive/ blue collar accidents	Total
<b>Number of accidents:</b>				
Blue collar at fault.....	10		10	20
Executive at fault.....		10	10	20
<b>Total.....</b>	<b>10</b>	<b>10</b>	<b>20</b>	<b>40</b>
<b>Losses:</b>				
Blue collar at fault.....	\$8,500		\$15,000	\$23,500
Executive at fault.....		\$15,000	8,500	23,500
<b>Total.....</b>	<b>8,500</b>	<b>15,000</b>	<b>23,500</b>	<b>47,000</b>
<b>Benefits accruing to:</b>				
Blue collar workers.....	8,500		8,500	17,000
Executives.....		15,000	15,000	30,000
<b>Total.....</b>	<b>8,500</b>	<b>15,000</b>	<b>23,500</b>	<b>47,000</b>
<b>Premiums:</b>				
Blue collar workers.....	(1)	(1)	(1)	23,500
Executives.....	(1)	(1)	(1)	23,500
<b>Total.....</b>	<b>(1)</b>	<b>(1)</b>	<b>(1)</b>	<b>47,00</b>

<sup>1</sup> Not available.

0

Again, despite the fact that blue collar workers and executives were "guilty" or "innocent" in equal numbers, the former who paid \$235 each in premiums, or \$23,500 as a "class," got a total of only \$17,000 back in benefits; however, the business executives who also paid \$235 each in premiums, or \$23,500 as a class, got a total of \$30,000 back in benefits. Again, the "insured" liability system can not produce equity between insureds of different income levels because it does not take account of their different loss exposure, i.e., the potential value of the insured's accident-caused income losses.

*Question 9. At page 144 of the study, Causation, Culpability and Deterrence in Highway Crashes, published by your Department in 1970, the following source is referred to:*

*"Klein, D. A. Critique of Lawton's 'Psychological Aspects of the Fault System,' U.S. Department of Transportation, 1970."*

*As we have never received copies of this study, would you please furnish us with some as soon as possible?*

**Response 9.** Copies of "A Critique of Lawton's 'Psychological Aspects of the Fault System'" by David Klein, U.S. Department of Transportation, 1970, are enclosed (Attachment B).

If I or my staff can be of any further assistance to you in this matter please let me know.

Sincerely,

CHARLES D. BAKER.

Enclosures.

ATTACHMENT A  
COMPARISON OF AUTO INSURANCE REFORM PLANS TO ILLUSTRATIVE DEPARTMENT OF TRANSPORTATION REFORM PRINCIPLES<sup>1</sup>

Plan type	Compulsory 1st-party, bodily injury benefits					Type of system	States in which bill has been introduced in legislature (limits and deductibles will vary)
	Medical	Income	Lost services	Other economic loss	Property damage		
DOT	Full medical coverage; deductibles permissible.	Up to \$1,000 per month for 36 months; deductibles permissible; broader coverage optional.	Up to \$75 per week for 36 months.		1st party, no fault basis.	All losses eligible for coverage by basic plan are exempt from tort recovery	1st party, no fault with residual tort liability.
AIA complete personal protection.	Full medical coverage.	\$750 per month; no time limit.	Reasonable payment for lost services.	Unlimited.	1st party, no fault.	Complete tort exemption.	Pure no fault.
Massachusetts "compulsory personal" protection.	1st party benefits to policy limits.	Up to 75 percent loss of wages and salary to policy limits.	Expenses reasonably incurred.	Maximum 1st party coverage for all economic loss \$2,000.	Not covered	Tort exemption against recovery of intangible damages in minor cases; subrogation is permitted between insurance companies for all payments.	Tort with compulsory 1st party benefits.
Cotter	Up to \$2,000 1st party medical.	Up to 52 weeks; \$500 per month maximum 1st party benefit.	Expenses reasonably incurred; \$12 per day reasonably incurred.		50 percent of 1st party medical expenses; 100 percent of medical expenses exceeding \$500.	No tort exemption but 1st party benefits deducted from 3d party settlement (insurance company subrogation).	Tort with compulsory 1st party benefits.

ATTACHMENT A—Continued  
COMPARISON OF AUTO INSURANCE REFORM PLANS TO ILLUSTRATIVE DEPARTMENT OF TRANSPORTATION REFORM PRINCIPLES—Continued

Compulsory 1st-party, bodily injury benefits					Property damage	Intangible loss	Tort exemption	Type of system	States in which bill has been introduced in legislature (limits and deductibles will vary)
Plan type	Medical	Income	Lost services	Other economic loss					
Davies.....	Full medical coverage.	75 percent of all wage loss up to \$750 per month.	Expenses reasonably incurred.	-----	Tort recovery except for motor vehicles which are under no fault.	Scheduled for loss of members and digits; maximum of \$25,000 for total disability; \$3,500 maximum for disfigurement.	Tort exemption for bodily injury except punitive damages for gross negligence (insurance against gross negligence prohibited); tort exemption for damage to motor vehicle.	1st party no fault with residual tort liability for punitive damages for gross negligence; property damage; auto insurance secondary.	Florida, Hawaii, Kansas, Minnesota.
Keeton-O'Connell <sup>2</sup> .....	Full medical coverage up to policy limits deductible permissible.	Full coverage to policy limits deductible permissible.	Expenses reasonably incurred.	Full coverage to policy limits deductibles permissible.	Dual option choice of (a) No fault coverage for motor vehicles, (b) 1st party liability coverage for motor vehicles tort liability applied to other property damage.	Tort exemption for 1st \$5,000 of pain and suffering.	Tort exemption for 1st \$5,000 of intangible loss and 1st \$10,000 of economic loss.	1st party no fault with residual tort liability auto insurance secondary.	Florida, Indiana, Michigan, Washington.
Insurance Company of North America. <sup>4</sup>	Full medical coverage to policy limits.	Full coverage to policy limits.	Expenses reasonably incurred.	-----	Tort liability applies.	Tort liability applies.	None. Claimant cannot recover damages paid under 1st party coverage. (Insurers have subrogation rights for these damages.)	Tort with compulsory 1st party benefits. Auto insurance primary.	Delaware (passed), Colorado.

Hart.....	Full medical coverage.	85 percent of monthly earnings to a maximum of \$1,000 a month for 36 months.	Expenses reasonably incurred.	Tort liability applies.	Tort exemption except for cases involving catastrophic harm (death, total disability or permanent or partial disability of 70 percent or more). No recovery unless pain and suffering exceeds \$1,000 and medical and hospital expenses exceed \$2,000.	1st party no fault with residual tort liability.
New Mexico HB 135 (Puerto Rico Plan).	Full medical coverage.			Tort liability applies.	Tort exemption for \$1,000 pain and suffering and \$2,000 of medical and hospital expenses.	State fund 1st party no fault with residual tort liability.
Pennsylvania HB 37 <sup>1</sup> .						
Study bills <sup>2</sup> .						
Combination tort—1st party systems.	Provide medical coverage up to policy limits.	Provide percent of income loss up to policy limits.	Expenses reasonably incurred.	Tort law applies.	Tort law applies: some plans exclude intangible loss for minor claims.	Combination tort—1st party system.
New York State Insurance Department plan.	Full medical coverage.	Unlimited net income loss compensation.	Expenses reasonably incurred.	1st party no-fault basis.	No coverage.	1st party no fault.

Hawaii, Kansas, Michigan, Minnesota, Montana, New Jersey, New Mexico, North Dakota, Oregon, Pennsylvania, Texas, Washington, West Virginia, California AB 117; Hawaii (SB 713); HB 800; Oregon HB 1300; New York SB 4400; Illinois SB 263.

<sup>1</sup> It should be understood that any summary comparison like this of detailed bills concerning a subject as complicated as auto accident reparations simply cannot do justice to the special features of individual plans. In addition, this summary was compiled from incomplete information about some of the plans and should not be considered authoritative.

<sup>2</sup> See attached list for bill numbers.

<sup>3</sup> Maximum no-fault benefits \$10,000.

<sup>4</sup> Required 1st party coverage of \$10,000/20,000 deductible, waiting period etc. permitted.

<sup>5</sup> Constitutional amendment authorizing legislature to enact no-fault laws.

<sup>6</sup> Legislation would create commission to study automobile insurance reform, in most States; bill is intended to defer action on other no-fault legislation.

**ATTACHMENT B****A CRITICAL ANALYSIS OF LAWRENCE LAWTON'S "PSYCHOLOGICAL ASPECTS OF THE FAULT SYSTEM AS COMPARED WITH THE NO-FAULT SYSTEM OF AUTOMOBILE INSURANCE"**

(By David Klein, Professor of Social Science and Human Development, Michigan State University, East Lansing, Mich.)

**INTRODUCTION**

The exponential growth of scientific knowledge, the increasing complexity of the technology, and the rapid proliferation of special-interest groups have combined to make the task of the legislator or the policy-maker exceedingly difficult. Determined though he may be to base his decisions on scientific evidence rather than on the persuasive rhetoric or the political pressures emanating from colleagues, constituents, or special interests, he finds it increasingly difficult to identify and evaluate such evidence and to assemble it into a solid foundation for policy. The problem is, of course, that no human being today can assimilate the facts and the expertise in the numerous disciplines and areas of special knowledge involved in many, if not most, policy decisions.

A common solution to this widely recognized problem is the enlistment of professionals and specialists of various kinds, not merely to staff operating agencies and to implement policy but also to advise legislators and policy-makers—through informal consultation, through the preparation of position papers, through testimony at formal hearings—as to the types of enabling legislation that are socially desirable and scientifically justified.

The use of professionals as consultants, however, raises several perplexing questions. The most obvious of these—Does the professional represent a special interest or does he present all the facts in order to provide a balanced view?—may or may not be the most important one. At least equally important is the question: Which disciplines and what kinds of evidence are relevant to a specific public issue? Should the professionals called upon for advice on the legal regulation of smoking, for example, represent such fields as thoracic surgery and biostatistics, or may social psychologists, obstetricians, and anthropologists have important data to contribute? Since it is the legislators and policy-makers who determine the disciplines to be called upon for consultation, it is possible that the advice they receive will be no broader than their initial view of the problem's dimensions.

Another question centers on whether the professional who spends time in a consultant capacity spends time also at the "growing edge" of research in his own discipline. "Keeping up with the literature" is, unfortunately, no longer an adequate way of keeping up with one's field, because today the professional literature serves to document priorities in discovery rather than to communicate the discoveries themselves. Scientific breakthroughs today become known months before they are published in the journals. There is always the danger, therefore, that the consulting professional may offer his clients the conventional wisdom of his discipline rather than the latest findings that modify it or render it obsolete.

Lastly, how is the legislator to reach a decision when two professionals, with apparently equally adequate credentials, reach diametrically opposed conclusions? Often enough the open-minded legislator is strongly persuaded toward a course of action by the first professional testimony he hears—only to be thrown into confusion by the contradictory testimony that he hears subsequently. And since the legislator is not himself a professional in a specialized discipline, how can he act as judge between two consultants who are, in fact, professionals?

Perhaps this problem—as well as some of the others mentioned above—can be alleviated if conflicting or contradictory professional testimony were presented not seriatim, as is generally the case in hearings, but in an adversary format, as is generally the case in legal proceedings. This format, in which two professionals confront one another directly, tends to cast the reader into the role of juror: he is expected to judge the reasonableness of the argument rather than the validity of the substance—a far more appropriate role for the layman whose responsibilities force him to deal with subject matter in which he has no extensive training.

In the following pages, therefore, we present a position paper sponsored by the Defense Research Institute in support of the present "fault" system of insurance. We interrupt this paper at numerous points for the presentation of adversary arguments which question the paper on both substantive and methodological grounds.

The weaknesses and errors in this document are so numerous and so serious as to render the conclusions untenable on the basis of either the evidence or the logic presented in the document itself. Because the weaknesses occur on several levels, they will be documented and discussed on several levels in subsequent sections of this review. They can, however, be summed up briefly in the following generalizations.

The author occasionally cites sound studies but draws from them conclusions and inferences that are entirely unwarranted; indeed, many of the studies can more logically be used to support a position opposite to the one supported in this document.

The author often seems unable to distinguish between sound research data and speculation based on impressionistic or hypothetical description.

The author frequently cites administrative data without an awareness of their biases, limitations, and other inadequacies.

U.C. BERKELEY LIBRARY

The author attributes to the "no fault" system characteristics which are not inherent in it; he then proceeds to draw inferences (often unwarranted) on the basis of these attributed characteristics.

The author shows an inadequate understanding of the nature of social norms, the process of conformity to norms, and conflict among norms; this leads him to inferences which he could not make if his understanding were adequate.

The author misinterprets many of the social-psychological experiments that he cites, and this misinterpretation leads to scientifically unacceptable conclusions.

Despite his numerous references to social and psychological data, the author ignores basic psychological and socioeconomic factors that affect both driving behavior and responsiveness to deterrent measures.

These general weaknesses lead the author into major and minor errors, all of which will be discussed below. Absolutely fundamental to his conclusions, however, are his assumption that vehicular negligence is a target of "community abhorrence" and his use of a mathematical model to demonstrate deterrent potentialities of the "fault" system. These two points, therefore, need to be reviewed first, and in considerable detail.

#### NORMS AND THEIR OBSERVANCES: IS "COMMUNITY ABHORRENCE OF THE NEGLIGENT DRIVER" A STRONGLY HELD NORM?

In its popular, everyday usage, the term *norm* has lost most of the precision that it retains in its technical usage in anthropology and sociology. But if the concept of *norms* is to be used in the construction of a closely reasoned argument (as it is in the paper under discussion), it must be used in its precise, technical sense. Unfortunately, however, the author demonstrates considerable confusion both as to the meaning of the term and as to the nature of compliance with norms. At one point (*see* p. 31) he implies that a current norm can be derived from a four-year-old survey of public opinion regarding *causation* of a phenomenon about which the respondents had no technical understanding; elsewhere he equates the norms with the statutory laws; and nowhere does he distinguish between stated (or ideal) norms and behavioral (or statistical) norms. Indeed, if the author were to use the term *norm* in its scientifically acceptable sense, his conclusion that "community abhorrence of the negligent driver" is a strongly held norm would become completely untenable.

Simply defined, a norm is a *mode of behavior* that the dominant segment of a society values, approves, or encourages. The strength of a norm at any point in time is measurable not by what the members of a society *say* or *legislate* (although these *stated* norms provide interesting information about the society's value system) but by how they *behave* and permit others to *behave*. This behavior includes not only the frequency with which the members violate the norms but also the measures they employ to prevent violation, the laws they make, the enforcement of these laws, the punishment and other negative sanctions meted out to violators, the resources devoted to prevent or discourage violations, etc.

For a number of reasons there is often substantial discrepancy between the statutory laws and the current norms. Some laws (against witchcraft or fornication, for example) reflect norms which changing social values have rendered obsolete or obsolescent; such laws may remain on the books, but they are rarely enforced. Other laws (e.g., Prohibition), created by pressure groups or by a particular set of social or economic circumstances, are widely violated by substantial segments of the noncriminal public. Still other laws (e.g., on school desegregation) are flagrantly violated because, although they reflect the ideal norms, they conflict sharply with the behavioral norms. Sometimes the technology and the value system change so substantially as to require modification of the laws (e.g., recent changes in the laws on contraception and obscenity; current efforts to change the laws on divorce, abortion, and marijuana use). In sum, the strength of a norm cannot be determined by consulting the statute books; rather, it must be determined by how people behave with respect to (or despite) the law. And, as we shall note shortly, the behavior of the American people with respect to negligent driving does not indicate the "community abhorrence" that is a central part of the author's argument.

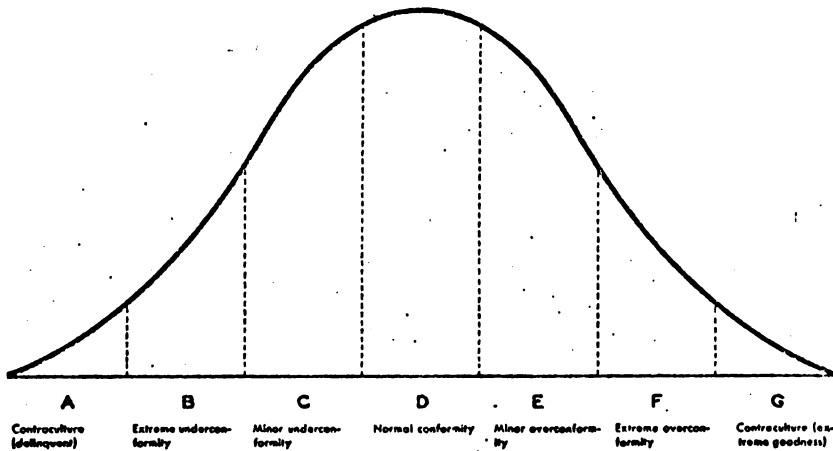

FIGURE 1

The author is equally simplistic in his view of how the members of a society conform to the norms. He seems to regard conformity as a yes-or-no, zero-sum kind of process and to believe that deterrent measures will turn nonconformers into conformers. In actuality, conformity to most norms is rarely a discrete, yes-or-no phenomenon but functions along a continuum—both for the individual and for society as a whole—as shown in Figure 1. No individual conforms completely at all times; instead, he ranges between conformity and various degrees of nonconformity, both positive and negative.<sup>1</sup> Similarly, even the identified nonconformist conforms most of the time (most murderers do not commit more than one murder; most drivers convicted of reckless driving do not drive recklessly at all times).

So, too, for a society as a whole. There are no norms to which *everyone* in a society conforms; a substantial amount of deviance is, as Fig. 1 indicates, "normal" and inevitable. Some of this total proportion of nonconformity is produced by the occasional deviations of generally conforming people. The balance of the nonconformity is produced mostly by people who do not conform because they are incapable of learning or complying with the norms (e.g., mental retardates, alcoholics, psychotics) or are members of a subgroup which has norms that run counter to those of the society as a whole (e.g., members of a juvenile gang, members of certain religious sects). For those types of deviants, conventional deterrent measures do not generally produce compliance or conformity. And, as we shall note shortly, many deviant drivers are members of nonconforming subgroups.

Given the fact that no norm commands universal conformity from all members of a society, one might argue that even if "community abhorrence of the negligent driver" were a very strong norm (an assumption that we shall challenge in subsequent pages), all the recklessness now prevalent on the highways might still be accounted for by (1) generally conforming individuals who occasionally deviate and (2) those individuals who, for reasons of incapacity or allegiance to deviant norms, do not conform to the "anti-negligence" norm. It is important to

<sup>1</sup> Almost twenty-five years ago, criminologists found that more than 90 percent of a random sample of "law-abiding" adults admitted to at least one episode of behavior which, if detected and prosecuted, would have been punished by a maximum sentence of not less than one year in a state prison. (J. S. Wallerstein and C. J. Wyle, "Our Law-abiding Lawbreakers," *National Probation*, March-April 1947, pp. 107-112.) Repeated replications of the research indicate that 90 percent was a conservative figure.

bear in mind that, despite their total impact, crashes are *infrequent* events and that only a small portion of them can be attributed unerringly and exclusively to negligence. This ultimate portion may be less than the proportion of "normal" deviance from the norm.

But the author, despite his use of so strong a word as "abhorrence," has not, in fact, demonstrated that vehicular negligence does violate a strongly held norm. In order to demonstrate this, he would have to show that the laws against violation are strictly enforced, that violators are consistently apprehended and severely punished, and that considerable resources are devoted to eradicating or preventing any and all behavior that might lead to violation. According to these criteria, unjustifiable homicide, for example, can be regarded as a violation of a very strongly held norm. In our society, more than 90 percent of murderers are apprehended (often at very high social cost), the penalties are severe (often including death), efforts are made to eradicate criminal gangs on the grounds that they may encourage murder, conspiracy to commit murder or to incite violence is punishable, and the punishment for murder usually expresses community vindictiveness and efforts at self-protection rather than an attempt to rehabilitate the violator.

On the other hand, such behavior as perjury, fornication, or spitting in public violates weak norms. Although there are laws against such behavior, and although most members of our society would express disapproval of it, the laws are rarely enforced and the punishments are not severe—in part because society does not regard the laws as "realistic," or the behavior as totally avoidable, socially harmful, or worth the very high cost of prevention.

Even a casual examination of the current social attitudes leads to the conclusion that vehicular negligence is not regarded as violating a strongly held norm. The legal penalties are not severe, enforcement is inconsistent but generally at a low level, punishment is often ineffective both in rehabilitating the offender and in protecting society, and violations are often regarded as inevitable. If we assume that the drunken driver is most likely to be the object of "community abhorrence," we should expect that society would devote considerable efforts in blocking his access to vehicle or highway. Yet, aside from some "don't-drink-when-you-drive" campaigns, what measures does society take? One would expect the laws to be comprehensive and effective. Yet most current laws specify a level of alcohol which is regarded as much higher than the level at which impairment occurs. One would expect rigorous enforcement. Yet it is estimated that at least 10 percent of all drivers on the highway at any time are impaired but are not detected. One would expect penalties to be severe, but they are not: even license revocation is not a severe penalty, since some 60 percent of drivers with revoked licenses continue to drive.

If we examine negligence not involving alcohol, we find that the violator is treated even more lightly. First or second offenses are punished by light fines and do not result in his driving being restricted. Even when negligence results in a crash, the outcome is in most cases a civil rather than a criminal action. The mere fact that a driver may insure himself against his own negligence demonstrates that negligence is not negatively sanctioned. It is not possible, for example, to insure oneself against the possibility of committing murder or larceny.

Moreover, if society actually "abhorred" negligent driving, it would take many measures to prevent its occurrence. It would prohibit advertising messages which advocate a style of driving likely to contribute to negligence (just as it prohibits messages inciting to murder). It would prohibit hot-rod clubs (just as it prohibits criminal syndicates). It would give driver education a highly effective and very important role in the curriculum instead of the marginal status it now has. It would monitor the highways systematically for possible violations (just as it inspects baggage to discourage and prevent smuggling). It would supervise with great care the behavior of adjudicated violators (just as it does with criminals on probation or parole). It would protect itself against further harm by incarcerating the violator (as it does with murderers, psychotics, and thieves). It would devote at least as much community effort and research resources to the eradication of negligence as it did to the eradication of polio, which at its worst exacted an annual death toll less than four percent that of highway fatalities. In actuality, of course, it does none of these things.

If, despite a low level of enforcement, almost half of a state population violates the traffic laws frequently enough to be issued at least one citation in a six-year period, one can draw either of two conclusions: (1) the law does not coincide sufficiently with the norms to be taken seriously by most people, or (2)

a large proportion of the driving population finds it impossible to comply with the norm no matter how highly the ideal norm may be valued in public-opinion surveys or in legislation.

This is not to imply that society has no negative feelings whatever about vehicular negligence. Rather it is to point out that such negative feelings are necessarily weakened by overriding values which conflict with them. Our society's stress on individual freedom works against a very high level of traffic surveillance, strict enforcement of traffic laws, and incarceration of offenders. The fact that the automobile has become an economic necessity for so large a proportion of the population operates against wholesale restriction of its use. And the fact that risk-taking is still valued substantially in our society mitigates against punishment of the antisocial risk-taker. The still prevalent feeling that accidents are largely "acts of God" also inhibits the focusing of blame on the negligent driver.

Two further points are perhaps even more important in demonstrating why vehicular negligence does not, in fact, violate a strong social norm. First, the entire concept of individual responsibility has undergone substantial modification during the past fifty years. In law, in psychiatry, in public health, and in many other areas of social interaction there has come to be greater awareness that an individual's actions are attributable less to his free will or his free choice and more to the influences of his psychological and social environment, past and present. Thus, an individual action is seen increasingly to have antecedents for which others—often the society as a whole—are in large part responsible. And this understanding of environmental influences has filtered down from the social scientists and the jurists to the public as a whole. One illustration of this broader understanding of environmental influences on individual actions is the shift of correctional institutions from punishment toward rehabilitation and the general increase in humaneness in the treatment of criminals.

Secondly, as research has become more sophisticated, it has demonstrated that very few kinds of human behavior have single, simply identified causes. With respect to driving behavior in particular, this concept of multiple causation has been much strengthened by evidence that negligence is only one link in a chain of events and conditions leading to a crash, that very few crashes are attributable exclusively to negligence, that vehicle design, highway design, and other factors of the physical and social environment are often implicated, and that modification of these factors might either reduce the incidence of negligence or render its consequences much less costly. This view has developed only within the past decade, but it has been disseminated so rapidly by such public figures as Ralph Nader, by the actions of the federal and state governments, and by reports of scientists that it is now much more widely accepted than the results of the cited Harris Survey would indicate.

If, in view of the foregoing discussion, we recognize that negligence is not in fact a violation of a strong norm and that multiple causation is a more widely accepted explanation for highway crashes, one might conclude that a shift toward the "no fault" system would bring insurance practice into closer harmony with both scientific findings and public sentiment.

#### THE MATHEMATICAL MODEL AND ITS PARAMETERS

A second crucial weakness in the paper under discussion involves the author's use of a systems model (p. 37) to predict deterrence. Each of the parameters that comprise the model is based on well-known social-psychological experiments (pp. 34 ff.) which, the author believes, demonstrate ways in which conformity to norms can be achieved or enhanced. The author then proceeds to argue that the fault system strengthens each of these parameters, thus increasing the over-all power of deterrence.

Unfortunately for his argument, the author's interpretation of these experiments is not shared by the experimenters themselves, by social-psychologists in general, or by any other behavioral scientist familiar with the purposes and background of the experiments. In actuality, these experiments were designed to identify the conditions under which individuals could be induced to abandon conventional social norms and adopt, instead, deviant norms which were arbitrarily devised for the purposes of the experiments.

Most of these experiments were conducted during or shortly after World War II, an event which aroused in behavioral scientists strong interest in such questions as: What were the relevant variables that caused the Germans to abandon their traditional religious and moral values sufficiently to engage in or tolerate

genocide and other atrocities? What conditions could best develop compliance with military norms (which include a willingness to obey unquestioningly and to kill) on the part of soldiers drafted from a civilian life which involved very different norms? Or, more generally, as in the Lewin experiment, what is the most effective way of inducing compliance with new norms, no matter how senseless, arbitrary, or repugnant these new norms might seem in the light of the old ones?

Thus, the Asch experiment demonstrated that Swarthmore sophomores (a group whose norms place high value on intellectual independence and a trust in one's own judgment) could be induced to abandon both these behaviors and to conform, instead, to a subgroup norm that was clearly deviant. Similarly, the Sherif and the Milgram experiments demonstrate not that an individual can be manipulated toward conformity to a widely held social norm but that he can be manipulated to virtually any norm as long as it is held by the subgroup in which he finds himself.

As is usual with laboratory experiments in social psychology, most of the experimental subjects were college students, whose membership in the middle class, whose academic status, whose feelings of autonomy, and whose general conformity with the dictates of the Protestant ethic are likely to give them considerable stability with respect to the norms they accept or reject. If these experiments demonstrate, as they do, a high degree of instability vis-a-vis the norms in relatively stable and secure subjects, the normative instability of less stable and less secure subjects is likely to be substantially greater. Certainly alcoholics and the victims of various psychopathologies (to whom the author attributes a disproportionate number of crashes) have already demonstrated by their behavior their susceptibility to deviation from the norms of society.

This difference in interpretation is crucial because it implies that many individuals—by virtue of their membership in a subgroup that holds clearly deviant norms about driving—are likely to embrace these deviant norms just as easily as did the subjects in the experiments cited. Even if the author is correct in his assessment of the various reinforcements offered by the "fault" system (and there is reason to believe that he overstates the case), such reinforcements are infrequent and insignificant compared to the daily reinforcements toward deviance that stem from membership in a deviant subgroup.

This is not mere speculation. There are data which indicate that teen-agers are more likely to be involved in a crash when there are *two or more* occupants in the vehicle than when they are alone—an indication that deviant attitudes toward risk-taking, toward authority, and toward rules and regulations may be transmitted to, or reinforced in, the driver through immediate peer pressure. There is evidence that the entire lower class in the United States embraces a set of norms that are so different from the dominant middle-class norms as to justify labeling the lower class as a "contra-culture" rather than a subculture<sup>2</sup>—and there is evidence, too, that young drivers whose records show high frequencies of citations and crashes have "working-class characteristics" (Pelz & Schuman; Carlson & Klein). Although there are no satisfactory studies on the subject, there is increasing evidence that members of the lower class may deviate as sharply from the norms about driving as they do from other middleclass norms.

In sum, insofar as the experimental findings can be generalized to the driving population, they predict that substantial groups of the population, by virtue of their membership in deviant subgroups, are more likely to conform to deviant driving norms than to conventional driving norms. This conclusion cannot be used to support the deterrent value of the fault system since it implies that the assumed deterrent effect will not apply to the very groups that may most need to be deterred.

(Whereupon, at 1 p.m., the hearing was adjourned, to reconvene subject to the call of the Chair.)

**Secretary of Transportation**

## PREFACE

Public Law 90-313, a Joint Resolution of the Congress, authorized the Secretary of Transportation to conduct a comprehensive study and investigation of the existing compensation system for auto accident losses.

The Joint Resolution recorded four specific Congressional findings which substantially guided the conduct of the study and the scope of its concern. These included:

" . . . suffering and loss of life resulting from motor vehicle accidents and the consequent social and economic dislocations are critical national problems. "

" . . . there is growing evidence that the existing system of compensation is inequitable, inadequate and insufficient and is unresponsive to existing social, economic, and technological conditions. "

" . . . there is needed a fundamental reevaluation of such system, including a review of the role and effectiveness of insurance and the existing law governing liability. "

" . . . meaningful analysis requires the collection and evaluation of data not presently available such as the actual economic impact of motor vehicle injuries, the relief available both from public and private sources, and the role and effectiveness of rehabilitation. "

The perspective of the study, then, was a national one, concerned with the nationwide system of auto accident compensation and its performance, rather than the problems peculiar to one state or region. By implication, the study was asked to address whether, in fact, the system was "inequitable, inadequate and insufficient and . . . unresponsive." Moreover, the study was specifically referred to "insurance" and the "law governing liability" as the subjects to be investigated.

The auto accident compensation system, of course, does not operate in a vacuum; but like any large complex institution, it continuously interacts with, influences and is influenced by other regimes and institutions. Moreover, it is plainly and abundantly clear that many of its troubles and problems are in substantial part not of its own making, but instead are caused by circumstances, events or decisions beyond its control. Thus, for example, the basic determinant of the size and nature of the compensation requirement, i. e., car crash losses, is almost entirely, if not completely, a function of outside forces -- traffic law enforcement, safety measures, car design, driver licensing and education, highway design, etc. Loss costs, themselves, reflect the prices being charged in the marketplace for hospital and medical care, auto repair and replacement parts, legal services, the cost of vehicles, etc., and they, too, cannot be significantly influenced, at least directly, by the compensation mechanism. Any or all of these externalities may themselves be worthy of public scrutiny and study. Indeed, most of them are now being intensively studied. Highway safety, for example, is a major and continuing responsibility of the U. S. Department of Transportation. However, these outside forces have been considered to be beyond the scope and charge of the Congressional mandate to study the existing compensation system, its performance, and possible alternatives to it.

The Department sponsored several major and minor research projects. Much of the output of these projects has been published over the past year in a series of research reports. The principal findings are briefly summarized in this report.

The conclusions made about the present system and its operations should not be interpreted to reflect adversely on any of the participants. The subject under investigation was in fact the "system" and not those who have tried to make it run and improve it. The conclusions are directed to the system.

The recommendations contained herein reflect the prudent hesitation that any public policymaker must feel when proposing changes in an institution that affects so many citizens in such important ways. Continuing public discussion and review should inform the ultimate decision and increase confidence in its soundness. That decision cannot be delayed for long, however, and the recommendations have been framed with that in mind. It is hoped that this report and the study that underpins it will contribute to that decision.

\* \* \* \* \*

The Department of Transportation's Automobile Insurance and Compensation Study was initiated under the administration of Secretary of Transportation Alan S. Boyd and completed under the administration of Secretary of Transportation John A. Volpe. As provided for in Public Law 90-313, the Study was assisted by four public advisory committees -- Industry, Legal, Consumer and Economic Regulation -- whose distinguished members, individually and collectively, made major contributions to both the substance and the guidance of the Study. In addition, at the request of the Department, the Casualty Actuarial Society formed a select committee of its members to advise on the conduct of certain aspects of the Study's research program. Their efforts, too, added immeasurably to the Study's product. The advisory committee members are listed in Appendix A.

Two other agencies, the Federal Trade Commission and the Federal Judicial Center, played major roles in the conduct of certain portions of the Study.

However, it should be noted that both the research and policy findings of this report and its recommendations do not necessarily reflect the views of advisory committee members, either individually or collectively. The same is true of the other agencies who aided in the Study. While their views and advice were strongly

solicited and gratefully received throughout the course of the Study, they bear no responsibility for the conclusions or recommendations reached in this report.

## TABLE OF CONTENTS

APPENDIX A	147

PART I. AN OVERVIEW:  
THE SIGNIFICANCE OF MOTOR VEHICLE ACCIDENT  
COMPENSATION IN THE UNITED STATES

Despite the overwhelming and pervasive influence that the motor vehicle has had on our society, economy and polity, it is only within the last decade that the motor vehicle accident has grown into a problem of national dimensions and concern. Why such a commonplace and familiar occurrence as the auto accident and its aftermath should have achieved this status is a matter that might be profitably reviewed. To put it bluntly: "Why should the Federal Government concern itself with the compensation of motor vehicle accident losses? "

Much of the answer clearly lies with the sheer dimensions of the problem, i. e. , in the monetary, social and human costs of automobile accident losses, accident compensation benefits and the resources absorbed in the compensation process.

However, before examining the overall estimates of losses, benefits and expenses, it is important to keep in mind the limitations of such aggregate data for evaluating the efficiency or adequacy of any compensation system. Aggregates may show that a system is not working efficiently, but alone, they cannot be relied on to prove the contrary. For example, if ten victims each suffer losses of \$1,000 for an aggregate loss of \$10,000, simply knowing that their aggregate benefits amounted to \$53,000 might well cast doubt on the efficiency of the compensation system. Even if their aggregate benefits equaled their aggregate losses, it would not, by itself, prove efficiency since it would still be possible that all benefits were paid to one person while the rest went uncompensated.

### A. Losses from Motor Vehicle Accidents

Before attempting to evaluate the performance of the existing motor vehicle accident compensation system in terms of its aggregate performance, it is important (and sobering) to estimate the losses with which that system must deal.

Simply in terms of human life lost, the results of a typical recent year (1967<sup>1</sup>) are truly monstrous, with more than 50,000 people sustaining motor vehicle accident-related injuries which ultimately resulted in or contributed to their death. Another 450,000 people were seriously injured.<sup>2</sup> How many people suffered lesser injuries is harder to determine, if for no other reason than that a large number of minor accidents go unreported to any source. But one estimate would place these at about 3,750,000.<sup>3</sup> Estimates of the number of

1. Although it would be desirable to have data that reflected current experience, the complexities of the data problem and the time necessary to process injury claims make 1967 the most recent year for which overall aggregate statistics can be presented.
2. U.S. Department of Transportation, Economic Consequences of Automobile Accident Injuries (1970), p. 64. (Hereinafter cited as Economic Consequences.) "Serious injury" is defined in Economic Consequences as an injury that resulted in medical costs (excluding hospital) of \$500 or more, or two weeks or more of hospitalization, or, if working, three weeks or more of missed work, or, if not working, six weeks or more of missed normal activity (p. 1).
3. The total number of people injured in 1967 was estimated at 4,200,000 (U.S. Department of Commerce, Statistical Abstract of the United States (1969), p. 557), from which the 450,000 seriously injured were deducted.

vehicles involved in 1967 accidents run as high as 24,300,000.<sup>4</sup>

These accidents affect their victims in many ways, including medical expenses, lost wages, myriad other types of economic loss, pain, grief over the loss or disability of a loved one, humiliation resulting from disfigurement, loss of use of some bodily member and other distressing consequences. Not all these losses -- for example, pain and suffering, inconvenience or disfigurement -- have a common denominator allowing individual experiences to be aggregated beyond simply counting the number of people who suffer them. Many elements of loss, however, can be quantified in dollar terms. These include medical expenses, wage loss, funeral expenses, costs of replacement services, future lost earnings, property damage and other miscellaneous out-of-pocket expenses. These "economic" items of loss, which can be measured in dollars, are of special significance in our calculation of system effectiveness since money is the basic balm employed by all compensation systems in helping to heal the wounds of accidents.

Economic losses can be viewed from a number of different viewpoints. The two employed here are called "societal" loss and "compensable" loss. The first is a measure of the total loss to society caused by death or injury of one of its members and damage to or destruction of his property. The second starts with societal loss and eliminates that portion which does not create a need for compensation, in most part, the lost future earnings of fatally injured victims with no dependent survivors.

4. National Safety Council, Accident Facts (1968), p. 40.

# 1. Societal Economic Loss<sup>5</sup>

The economic consequences of motor vehicle accidents constitute a serious national social and economic problem worthy of the careful attention of government at all levels. An estimate of society's losses from motor vehicle crashes in 1967 is shown in Table 1.

TABLE 1  
ESTIMATED SOCIETAL ECONOMIC LOSS RESULTING  
FROM 1967 AUTOMOBILE ACCIDENTS

	Millions of Dollars	Percent
Medical Expenses	\$ 1,243	9%
Wage Loss	(8,175)	56
Fatalities	5,163	
Injuries	3,012	
Other Expenses	207	1
Property Damage	4,860	34
TOTAL	\$14,485	100%

Source: Economic losses of seriously injured victims are taken from Economic Consequences, pp. 83, 84, 87 and 88. Quantifying the economic losses of other accidents is more difficult as no direct investigation of the amounts involved or even the number suffering injury has been possible. However, approximations can be developed. The 3,750,000 personal injuries neither fatal nor "serious" (as that term has been defined) can be assumed to be relatively minor in

5. "Societal economic loss" includes the estimated lost future earnings of all fatal victims, including those without dependent survivors. For a brief discussion of this concept as contrasted with that of "compensable economic loss," see Economic Consequences, p. 23.

economic impact. Personal injury claimants who did not suffer death, permanent disability or economic loss to date of settlement in excess of \$1,500 had average medical losses of \$131, average wage losses of \$81 and average other expenses of \$12 (based on unpublished data from the Department of Transportation's personal injury study). Assuming that the remaining 3,750,000 injured victims suffered similar losses, their aggregate economic losses would be \$840 million -- \$491 million medical loss, \$304 million wage loss and \$45 million other loss (excluding property damage).

Property damage is the most difficult loss to measure accurately. Assuming that 24,300,000 vehicles were involved in property damage accidents at an average cost per vehicle of \$200, the total loss would be \$4,860 million. The \$200 estimate was derived by taking the average paid loss (including loss adjustment expenses) for property damage claims in 1967 reported by the Insurance Rating Board to the Department in response to an inquiry and deducting loss adjustment expenses on the basis of ratios appearing in A. M. Best Company, Best's Aggregates and Averages (1968). (Hereinafter cited as Aggregates and Averages.)

## 2. Compensable Economic Loss

It would be unfair to judge any compensation system against the foregoing loss estimate since it would not be rational to attempt to compensate all societal future lost earnings. To develop an estimate of compensable losses, future earnings of fatality victims with no dependent survivors should be removed. In addition, some reduction should be made to reflect the fact that even the decedents with dependent survivors would not, themselves, consume resources. After making these adjustments,

compensable losses can be estimated at about \$10,549 million, as shown in Table 2.

TABLE 2  
ESTIMATED COMPENSABLE ECONOMIC LOSS  
RESULTING FROM 1967 AUTOMOBILE ACCIDENTS

	Millions of Dollars	Percent
Medical Expenses	\$ 1,243	12%
Wage Loss	(4,239)	40
Fatalities	1,227	
Injuries	3,012	
Other Expenses	207	2
Property Damage	4,860	46
<b>TOTAL</b>	<b>\$10,549</b>	<b>100%</b>

Source: Table 1 and Economic Consequences, pp. 75 and 78.

Significantly, there are very substantial losses involved at both extremes of the loss spectrum. Of the total \$10.5 billion of compensable loss, \$3.4 billion or 32 percent was incurred by the 45,000 very seriously or fatally injured victims who each sustained losses of \$25,000 or more.<sup>6</sup> The average loss of these victims was \$76,000.<sup>7</sup> By contrast, the approximately 22,000,000<sup>8</sup> victims who suffered only property damage incurred total losses of about \$3.8 billion<sup>9</sup> or 36 percent of total compensable loss.

Thus, it would seem that there are significant opportunities for economic savings if vehicle occupants could

6. Economic Consequences, pp. 89-90.

7. Ibid.

8. National Safety Council, Accident Facts (1968), p. 40.

9. By removing more serious accidents, the Insurance Rating Board's \$200 property damage estimate would be reduced to perhaps \$175.

be protected from serious injury or death when crashes do occur and also if vehicle damage could be prevented or significantly reduced in minor accidents. A car capable of resisting damage in low-speed collisions and of protecting its occupants in severe crashes would very substantially reduce overall accident losses, even if all vehicles in severe crashes were totally demolished in an economic sense. Economic loss reduction efforts, therefore, to be truly effective, must address the accident environment of both serious and minor crashes.

Source: Economic Consequences, pp. 154-156. Total benefits in Economic Consequences differ somewhat from total benefits in Table 3. This difference is explained in a footnote on page 127 of the above publication.

It is logical, of course, to compare these reparations to the victims' losses. In doing so, however, one must keep in mind not only the relative imprecision of the estimates involved but also the arbitrariness of the definition of "compensable losses." "Compensable losses," as the term is used here, includes both very small and very large economic losses, and it can be legitimately questioned whether any formal reparations system -- especially one based on a privately operated insurance system -- can or should try to compensate fully either of these kinds of losses. This is particularly

true with respect to the lost future earnings of deceased victims with dependent survivors or those of permanently disabled victims, a type of loss which bulks very large in the total. Indeed, the lost future earnings from a single individual victim discounted to present value can, given the right combination of circumstances, amount to as much as a third of a million dollars. Whether society can afford to assure all such victims full recovery of all calculable losses is highly questionable, at least at this time. Moreover, in the comparisons of losses and benefits used here, no allowance has been made for any tax benefits accruing to victims as a result of their casualty losses. All these considerations should influence any value judgments drawn from the following loss/benefit comparisons.

The aggregate benefits of \$2,533 million received by dependents of deceased victims and by seriously injured victims can be compared with their aggregate compensable economic losses which were estimated at \$5,127 million.<sup>1</sup> Thus, at least in overall terms, it can be seen that total benefits from all compensation systems fell far short of compensating the economic losses of those most severely affected by motor vehicle accidents.

Not all benefits paid by these systems, of course, were intended to compensate economic losses. In particular, some of those paid under automobile liability insurance were for intangible losses. In addition, some victims were able to collect from two or more sources for the same losses. When these facts are taken into consideration, it is found that \$3,116 million of the \$5,127 million of total compensable economic loss was not compensated.<sup>2</sup> In contrast, the remaining victims received in the aggregate an estimated \$566 million more than their estimated economic loss.

1. Economic Consequences, pp. 89-90.
2. Based on unpublished data from the Department's study of fatally and seriously injured auto accident victims.

Although it is not possible to make the same kind of estimates for the reparations received by all other victims, some rough approximations have been developed, and they are presented in Table 4. These reparations, estimated at \$3,937 million, can be compared with total compensable economic losses for this group of \$5,422 million.<sup>3</sup> Again, a sizeable amount of potential compensable economic loss is left uncompensated. However, clearly the implications are not quite the same as with the seriously injured, since the losses suffered by less seriously injured victims are not nearly as severe, nor the impact of these losses as distressing.

Source: (a) Gross bodily injury and property damage direct incurred losses were \$2,902 million and \$1,194 million in 1967 (A. M. Best Company, Best's Executive Data Service (1968), Property

3. Total compensable loss (\$10,549 million) less compensable losses of fatally and seriously injured victims (\$5,127 million).

and Liability Edition). According to Insurance Rating Board estimates given to the Department of Transportation, medical payments benefits amounted to about 8.5 percent of bodily injury incurred losses, or about \$247 million in 1967. From the remaining \$3,849 million liability losses (which is assumed to represent liability payments), lawyers' fees of \$725 million and other litigation expenses of \$55 million were deducted, leaving net liability payments of \$3,069 million. Plaintiffs' attorneys' fees were estimated at 27.3 percent of bodily injury payments, excluding medical payments (U.S. Department of Transportation, Automobile Personal Injury Claims (1970), p. 73). Other litigation expenses were estimated by using the 1968 expenses derived from U.S. Department of Transportation, Automobile Accident Litigation (1970), p. 7 (i. e., \$250 expenses per case x 220,000 cases). After deducting \$813 million in net benefits to fatally and seriously injured accident victims (Table 3), net liability benefits to all other victims were \$2,256 million. Deducting \$108 million in auto medical payments benefits to fatally and seriously injured auto accident victims (Table 3) from \$247 million yields \$139 million in medical payments benefits to the remaining victims.

(b) In 1967, stock and mutual direct collision losses incurred were \$1,309 million and reinsurer losses were \$8 million, from Aggregates and Averages (1968), pp. 135 and 205. Losses incurred by reciprocals were estimated at \$70 million on the basis of their share of losses in 1968 based on data received from Best's Executive Data Service. From the total collision losses incurred in 1967 of \$1,387 million, \$141 million was paid to victims of fatal or serious injuries (Table 3), and \$1,246

million was paid to the rest of the auto accident population.

(c) Hospital and medical insurance benefits for the seriously injured with total economic losses of less than \$1,500 aggregated about 30.3 percent of total medical expenses for the same group. Thus,  $0.303 \times \$491 \text{ million} = \$149 \text{ million.}^*$

(d) Other personal insurance benefits for the seriously injured with less than \$1,500 total economic loss were about 4.8 percent of total losses (excluding property damage). Thus,  $0.048 \times \$840 \text{ million} = \$40 \text{ million.}^*$

(e) Employee's paid sick leave benefits to the seriously injured with total economic losses below \$1,500 were about 12.1 percent of total wage loss for the group. Thus,  $0.121 \times \$304 \text{ million} = \$37 \text{ million.}^*$

(f) Workmen's compensation benefits for the seriously injured with total economic losses below \$1,500 were 3.0 percent of total medical and wage loss for the group. Thus,  $0.03 \times \$795 \text{ million} = \$24 \text{ million.}^*$

(g) Miscellaneous other benefits to the seriously injured with total economic loss under \$1,500 was 5.5 percent of total losses excluding property damage). Thus,  $0.055 \times \$840 \text{ million} = \$46 \text{ million.}^*$

---

\*Percentages are derived from Economic Consequences, pp. 103-104 and 181-183; dollars are estimates derived in the source to Table 1.

Table 5 presents the total reparations for all automobile accidents in 1967.

\* \* \* \* \*

Thus, in summary, aggregate net reparations for auto accident victims in 1967 totaled about \$6.5 billion compared with aggregate "compensable losses" of \$10.5 billion. While this overview of auto accident losses and benefits gives some crude sense of the dimensions and performance of the present complex of reparations systems, the more important matter is how the victim fares as an individual, and this will be examined in some detail in this report.

## PART II. SELECTED FINDINGS

A. The Automobile Accident Reparations System

The automobile accident reparations system, in the sense that it enjoys legal recognition and is sustained by legal pressures to implement it, consists of a complex of tort liability principles and automobile liability insurance. The legal pressures mainly consist of the financial responsibility statutes which, while varying from State to State, have a common theme and purpose, i. e., the exertion of a high degree of compulsion upon every motorist to possess automobile liability insurance. The counterparts of these pressures on the motorist are the assigned risk plans which compel automobile liability insurers to accept an equitable share of drivers who are unable to obtain insurance coverage voluntarily in the private insurance market. Both forms of compulsion are premised upon the likelihood that the losses of the innocent accident victim will remain uncompensated no matter how clear his legal right to recover unless the proceeds of an automobile liability insurance policy are available.

Viewed from a broader perspective, reparations for automobile accident losses often flow from other types of insurance or benefit sources. These include the kinds of automobile insurance which yield benefits on a contractual basis without respect to fault, such as automobile medical payments and collision insurance, and non-automobile benefit systems, such as life insurance, accident and health insurance, hospital and medical prepayment plans and social security. However, except in Massachusetts under its recently implemented partial "no-fault" legislation, none of the first-party automobile contractual coverages enjoy legislative recognition. Indeed, the automobile owner normally cannot legally compel the issuance of such contractual coverages if he is unable to purchase them in the voluntary insurance market. Just as the workmen's compensation

reparations system cannot be safely founded upon the assumption that workers injured in industrial accidents will necessarily have access to other reparation sources, neither can a reparations system for traffic accident victims assume that such victims have other means of securing compensation for their injuries and other losses.

### 1. The "Fault" Principle -- Negligence

Despite the prevalence of the notion that "negligence" as the predicate and moral basis for the compensation of accident victims has legal roots stretching back into antiquity, the fact is that legal scholars are well agreed that "negligence" constitutes a relatively recent development in Anglo-American law. Superseding a strict liability regime, the ascendancy of the negligence principle can be traced to the Industrial Revolution. Its rationale was that the needs of society demanded that the growth of industry and the expansion of commerce should not be impeded by the onerous financial liabilities inherent in a strict liability regime. As Professor Fleming James has said:

"While the basing of liability on fault is no new thing, the concept of negligence as an independent ground of liability is quite modern, and it succeeded a period in which liability for accidental harm was dominated by the trespass or strict liability principle. This was a development largely of the nineteenth century; it coincided with the transportation and industrial revolution and with the climate of opinion that has been called social Darwinism with its individualism and its acceptance of laissez faire. During this period the notion that liability should be based on fault did indeed become dominant."<sup>1</sup>

1. Fleming James, "Analysis of the Origin and Development of the Negligence Actions," The Origin and Development of the Negligence Action (1970), U.S. Department of Transportation, p. 36.

The judicial philosophy which ultimately prevailed held that it was better for the victim of an accident not provably the "fault" of some other individual to bear the financial consequences of his injury than to deter others from engaging in socially useful activities because of the risk of having to bear the costs of accidents that might occur. Fault, then, became a morally flavored compromise between earlier strict liability concepts and the total abnegation of responsibility for harm flowing from socially desirable activities.

However, "fault" in the context of negligence carries no connotation of intent or evil motivation, but rather, is concerned solely with a breach of legal duty resulting from a failure to exercise that care which "a reasonable man of ordinary prudence in like circumstances" would exercise. This hypothetical man may manifest limitations that embody the normal standard of community behavior, but nevertheless is an abstract ideal in that "[h]e is not to be identified with an ordinary individual who might occasionally do unreasonable things; he is a prudent and careful man who is always up to standard."<sup>2</sup>

Under the strict liability principle, the focus of concern was the activity giving rise to the injury or damage; under the negligence principle, the focus shifted to the conduct of the actor and whether or not his conduct deviated from the standard of the ordinary, prudent and reasonable man. In noting that the mood of the times called for scrutiny of the actor's conduct rather than consideration of the victim's plight, Professor James has written: "In the climate of opinion prevailing in the

- 
2. William Prosser, Torts, Third Ed. (1964), p. 154. Any moral tones of the negligence principle are further attenuated through application of the doctrine of respondeat superior which renders an employer or principal vicariously liable for the negligence of his employee or agent.

nineteenth century, it is not at all surprising that the fault concept . . . emerged as dominant. "3

The same era which gave birth to the philosophy that social progress should not be stifled by fastening the costs of injuries and losses upon useful activities also gave birth to the automobile; and the same deference to progress militated against holding the vehicle's owner or operator strictly accountable for any and all injury or damage which it might cause. In general, the contention that the automobile was inherently dangerous, and therefore that principles of strict liability should apply, was rejected.<sup>4</sup>

The tort system requires, as a precondition to the shifting of the economic burden of loss from the accident victim to the putative wrongdoer, that the victim affirmatively establish not only that the alleged wrongdoer was negligent, but also that such negligence directly or proximately caused the accident and injuries. The factual and legal hurdles that the accident victim must surmount if he is to achieve economic recovery generate adversary proceedings which alone can resolve the disputed issues if the parties are unable or unwilling to resolve them by agreement. If the injured accident victim fails to prove that the alleged wrongdoer was negligent or that such negligence was the proximate cause of the accident, or fails to prove any other essential element of his case, he cannot shift his loss to the wrongdoer.

A further legal impediment to the accident victim's recovery was raised in the English law in the form of the

3. Fleming James, *op. cit.*, pp. 40-41.

4. However, at least one jurisdiction, Florida, held that the automobile was an inherently dangerous instrumentality to such extent that its owner would be held vicariously liable for the negligence of any driver he permitted to use the vehicle.

doctrine of contributory negligence.<sup>5</sup> Under this rule, a plaintiff in a negligence case was not entitled to recover if his own negligence contributed in even the slightest degree to the proximate cause of the accident.<sup>6</sup> Despite

5. The doctrine has since been abandoned in England.

6. The doctrine itself appears to rest upon a meager foundation: ". . . [T]he concept that contributory negligence bars recovery rose to prominence in response to the demands for a legal system compatible with the demands of a growing industrial economy. The unimpressive opinions in Butterfield v. Forrester, 11 East 59, 103 Eng. Rep. 926, (K.B. 1809), uniformly recognized as the fountainhead of the doctrine, could not have received the proliferation to which they were subjected if an additional bar to recovery were not considered to be necessary and appropriate to the times. Society as a whole stood to benefit from the workings of an industrial economy, and as a general proposition it could not afford to burden itself with compensating those individuals who were so unfortunate as to be injured accidentally by an instrument of progress." (Cornelius J. Peck, "Negligence and Liability Without Fault in Tort Law," The Origin and Development of the Negligence Action (1970), U.S. Department of Transportation, p. 56.

The rule has met with all but universal condemnation from those who have had occasion to comment upon it. Thus, it has been said: "Where one party asks that another compensate him for an injury caused by their joint negligence, the most equitable solution of the problem would be to allow him to recover only that proportion of the loss for which the other had been responsible. The courts, however, have consistently refused to apportion loss in negligence actions at common law. The reasons usually advanced for this position are that the law will not settle disputes between wrongdoers and that it has no scales with which to measure the relative fault of the negligent parties. The first has been attacked by

scholarly strictures against the doctrine of contributory negligence, it took root in this country; and until quite recently, the rule prevailed in all but a handful of States. However, accelerated by studies and inquiries into the operation of the automobile accident reparations system, there has been a decided trend toward abandonment of the contributory negligence doctrine in favor of the comparative negligence rule, particularly of the Wisconsin type under which the plaintiff may recover so long as his negligence was less than that of the other party, with his recovery being diminished proportionate to his negligence.<sup>7</sup> The harshness of the contributory negligence

---

almost every author who has had occasion to discuss contributory negligence. Especially it is subject to criticism as applied to automobile cases, wherein the plaintiff's wrongs are usually inadvertent and are scarcely ever intentional. Although the second has more merit, the courts without difficulty have apportioned negligence in other fields of law." (Richard M. Nixon, "Changing Rules of Liability in Automobile Accident Litigation," *Law and Contemporary Problems*, Vol. 3 (1936), p. 476).

7. Although a few States require that a plaintiff affirmatively establish his freedom from contributory negligence, the great weight of American authority appears to be that contributory negligence is an affirmative defense for the defendant with the burden of proof lying with him. Thus, except in the relatively rare case where the facts and the inferences arising from such facts incontrovertibly establish that the plaintiff's negligence contributed to the cause of the accident, the issue of contributory negligence can be resolved only by a jury, and juries customarily have been loathe to find that the injured plaintiff's own negligence contributed to the proximate cause of the accident.

rule has been softened not only by statutes but, to an even greater extent, by judicial doctrines.<sup>8</sup>

Although negligence law in its formative stages was primarily concerned with comparing the actor's conduct to the standards of a hypothetical ordinary, prudent and reasonable man, its principal concerns now lie with the actual or alleged violation of statutes or ordinances. Normally, where a statute or ordinance has been enacted for the safety and protection of the public, its violation constitutes negligence per se, i. e., the ideal, reasonable man always observes the law. The abundance of laws, ordinances, etc., surrounding the use and operation of motor vehicles on the streets and highways makes it almost certain that any accident controversy will be resolved through reference to the statutory framework.

## 2. The Insurance Element of the Reparations System

The purpose and function of casualty insurance, including automobile insurance, is to spread the risk of loss among many people exposed to a common hazard. Insurance works to substitute certainty for uncertainty --

### 8. For example, the doctrine of "last clear chance."

That is, where the plaintiff's negligence has placed him in a position of peril but where the defendant knew or should have known of plaintiff's peril in time to avoid the accident through the exercise of due care, the defendant is liable notwithstanding the plaintiff's original negligence. It is interesting to note that the American Bar Association relates the "last clear chance" rule to contributory negligence by recommending that: ". . . [S]tates in which contributory negligence is abolished should consider the abolition of the last clear chance rule." (American Bar Association, Report of the American Bar Association Special Committee on Automobile Accident Reparations (1969), p. 79.) (Hereinafter cited as ABA Report.)

the certainty of a small cost (the insurance premium) for the uncertainty of no cost or some cost ranging from small to catastrophic (the accident loss).

Although both the frequency and severity of a given type accident may be predictable actuarially when one is dealing with a large number of actors or events, specifically who will have such an accident and when cannot be predicted. However, if each of several persons exposed to a common hazard contributes an amount (the premium) sufficient in the aggregate to cover the predicted losses, then those upon whom the contingency actually falls will have to bear no loss greater than the premium itself. Collaterally, those insured persons spared from the hazard may rest secure in the knowledge that they are immune from any loss in excess of their premium. Thus, unlike gambling which creates a risk that did not exist prior to the wager, insurance eliminates a risk that existed prior to the insurance transaction.

There is nothing in the insurance principle which requires that every premium payer contribute exactly the same amount to the insurance fund. Equity may require that those having a greater exposure to the hazard (i. e., a greater likelihood of loss or a greater value at risk) contribute more than those less exposed. Conversely, those who have been free of loss in the past cannot be freed from contributing to the common fund for future losses as long as they remain exposed to the hazard.

Originally, the sole purpose of automobile liability insurance was to defend insured motorists against claims by others and to protect their assets from being depleted by adverse judgments. No consideration of the adequacy, the timeliness or the assurance of compensation for the injured party played any part in the matter. Indeed, the entire avoidance of compensation of the accident victim was calculated to further the interests of the contracting parties since the insurer stood to gain from the

maximization of its profits and the insured stood to gain from the minimization of his rates. Moreover, the insured and his insurer were free to circumscribe their mutual obligation however they desired with respect to the scope of the risk insured and the amount of premium to be paid. These were matters in which the potential accident victim had no rights since he was neither a party to the contract nor an intended third-party beneficiary. The theoretical right of the accident victim to recover in a tort action was, of course, not jeopardized in any way by the insurance contract. Under such circumstances, the liability insurer's right to require the insured to observe the terms of the contract meticulously and to condition its own obligations upon such observance was beyond question, either in law or in morals.

Financial responsibility measures sprang from a public recognition that the claimant's theoretical right of tort recovery in a motor vehicle accident was illusory unless the judgment obtained was actually paid, and that this was quite unlikely to happen unless the judgment became the obligation of an insurer. Except for Massachusetts, which enacted a compulsory automobile liability insurance law as far back as 1927, early financial responsibility measures generally were loose and persuasive in character rather than obligatory. Recognition of their inadequacy grew with mounting numbers of automobile accident victims and led to their strengthening in the late 1940's and early 1950's.

Currently, every State has a financial responsibility law ranging from outright compulsion, such as those in Massachusetts, New York and North Carolina, to the security deposit type of law which, while not actually compelling the purchase of liability insurance, does exert a powerful pressure for its purchase.<sup>9</sup>

- 
9. The security deposit law provides that a motorist involved in an accident and unable to establish evidence of liability insurance is required to deposit

Lying between the compulsory and the security deposit types of financial responsibility laws are other varieties which do not compel the purchase of liability insurance but do require a declaration of its presence or absence during motor vehicle registration. Absence of liability insurance requires payment into an unsatisfied judgment fund or uninsured motorists' fund.<sup>10</sup> Such payment, of course, does not afford the uninsured motorist any protection with respect to his legal liability, nor does it free him from the obligation to deposit security in the event he is involved in an accident. Conversely, the accident victim has no direct rights against such funds.<sup>11</sup>

---

security sufficient to cover the amount of any claim or suit against him or lose his driving privileges and registration certificate. The requirement for the deposit of security essentially is without regard to whether or not the motorist involved in the accident was at fault. In certain instances, however, such as where the other driver was convicted of an offense or simply ran into the rear of the motorist's stopped vehicle, the obligation to deposit security may be avoided.

10. New Jersey, Maryland and Michigan have unsatisfied claim and judgment laws with unsatisfied judgment funds, while Virginia and South Carolina have enacted uninsured motorist laws with uninsured motorist funds. Motorists who have been convicted of certain grave traffic offenses or who have failed to deposit security incident to accident involvement are ineligible to obtain registration through payment into the unsatisfied claim and judgment or uninsured motorist funds, but rather, are compelled to obtain liability insurance certified by an authorized insurer. Such persons are also usually required under the weaker safety responsibility type of financial responsibility law to establish proof of financial responsibility for the future through policies certified by authorized insurers.
11. In the case of the unsatisfied claim and judgment funds, the accident victim must first exhaust all reasonable

Such persons are also usually required under the weaker safety responsibility type of financial responsibility law to establish proof of financial responsibility for the future through policies certified by authorized insurers.
11. In the case of the unsatisfied claim and judgment funds, the accident victim must first exhaust all reasonable

Understandably, the courts have discerned in the financial responsibility measures a pervasive public policy to imbue the auto accident reparations system with a fundamental concern for the accident victim.<sup>12</sup> In recognition of the importance of insurance to the compensation of the victim, the courts have often refused to recognize any forfeiture of the insured's coverage because of breach of policy conditions (e.g., such as those requiring immediate notice of accident or the insured's cooperation) in the absence of a clear showing by the insurer that its rights have been actually and substantially prejudiced.<sup>13</sup>

---

efforts toward recovering from the offending motorist. In the case of uninsured motorist funds in Virginia and South Carolina, the accident victim must recover, if at all, from his own uninsured motorist insurer since the proceeds of uninsured motorist funds are used solely to reimburse the insurers for providing uninsured motorist coverage.

12. Thus, in Interinsurance Exchange of Automobile Club of Southern California v. Ohio Casualty Insurance Co., 58 Cal. 2d 142, 373 P.2d 640, the California Supreme Court said: "The entire financial responsibility law must be liberally construed to foster its main objective of giving monetary protection to that ever changing and tragically large group of persons who while lawfully using the highways themselves suffer grave injury through the negligent use of those highways by others."
13. See Allstate Insurance Co. v. Grillon, 251 A.2d 256 (N.J. Sup. Ct., App. Div., 1969), where the court, in commenting upon the necessity for the insurer to prove prejudice in order to be relieved of obligation through the insured's failure to give notice, said: ". . . [I]t becomes unreasonable to read the provision unrealistically or to find that the carrier may forfeit the coverage, even though there is no likelihood that it was prejudiced by the breach. To do so would be unfair to insureds. It would also disserve

Moreover, with respect to reparating innocent accident victims, liability insurance would often be meaningless unless coverage extended beyond the owner to any driver having his express or implied permission to use the insured automobile. Actually, only a minority of jurisdictions statutorily mandate such an omnibus coverage. But many courts have concluded that the overriding public policy found in the financial responsibility law precludes the insured and insurer from agreeing to any limitation that would deny liability coverage to a driver using the vehicle with permission of the insured named in the policy.<sup>14</sup>

Since accomplishment of the objectives of the financial responsibility statutes demands that the motorist required to obtain automobile liability insurance be able to do so, it is understandable that the adoption of assigned risk plans and their rapid growth in size

---

the public interest, for insurance is an instrument of social policy that the victims of negligence be compensated."

Also see Cooper v. Government Employees Insurance Co., 237 A.2d 870, where the court admonished: "We should therefore be mindful also of the victims of accidental events in deciding whether a forfeiture should be upheld."

14. See, for example, Wildman v. Government Employees Insurance Co., 307 P.2d 359 (California) and Jenkins v. Mayflower Insurance Exchange, 380 P.2d 145 (Arizona), where the court concluded (p. 147): "Where the basis upon which this [financial responsibility] act has been declared constitutional is 'preventing financial hardship and possible reliance upon the welfare agencies,' we cannot constitutionally allow artful distinctions . . . to defeat the purpose of the act."

followed hard upon the heels of the strengthening of the financial responsibility laws.<sup>15</sup>

Until quite recently, no State's assigned risk plan gave an applicant the legal right to demand and receive first-party coverages through such plans. Thus, although a motorist who was denied liability insurance in the voluntary insurance market might have a legal right to obtain such insurance through the assigned risk plan, he could not, for example, compel the issuance of medical payments or collision insurance. The importance that many persons attached to such coverages led them to insure with specialty companies. These companies would issue the additional coverages along with the required liability coverage, often at very high rates. Many such insurers specializing in high-risk drivers proved to be financially unsound and ultimately became insolvent.

It is often assumed incorrectly that only drivers with demonstrably poor driving records populate assigned risk plans. The fact is, however, that many "clean" risks with driving records unblemished by accidents or violations are forced to resort to such plans simply because of their inability to purchase the legally required liability insurance in the voluntary market. For example, 62 percent of 1969 New York assigned risk plan applicants enjoyed "clean" driving records during the preceding 36 months; the proportion was 67 percent in South Carolina, 57 percent in North Carolina, 55 percent in Wisconsin and 50 percent in Pennsylvania.<sup>16</sup>

Such conditions have led to a growing insistence that assigned risk plans be broadened to include medical payments and collision coverages, and a number of States have moved to broaden their plans. In addition, both the

16. Ibid., p. 37.

National Association of Insurance Commissioners and the National Industry Committee on Automobile Insurance Plans (assigned risk plans) have proposed that applicants be able to obtain higher limits of liability, medical payments, uninsured motorist and physical damage (collision and comprehensive) insurance.

Despite the legal pressure upon motorists to possess liability insurance, the problem presented by the uninsured motorist has remained. It appears conservative to estimate that 15 to 20 percent of the nation's automobiles in 1967 were not even nominally insured with respect to liability.<sup>17</sup> It would seem valid to assume that the owners and drivers of uninsured automobiles have a greater accident potential than insured owners and drivers.

It was the ruinous financial losses sustained by the innocent victims of automobile accidents that led to demands for legislative solutions along the lines of compulsory insurance, unsatisfied judgment laws and similar remedies. By and large, insurers and their associations denounced such remedies as being not only ineffective but as creating more problems than they solved. The insurance industry countered such legislative proposals by offering uninsured motorist coverage which was designed to enable the insured to recover from his own insurer all sums that he was legally entitled to recover but could not collect from an uninsured motorist. Some States, such as Virginia and South Carolina, immediately seized upon uninsured motorist coverage as the solution to the problems presented by the financially irresponsible motorists and enacted laws requiring that such coverage be provided with every liability insurance

- 
17. U.S. Department of Transportation, "Drivers Without Insurance," Driver Behavior and Accident Involvement: Implications for Tort Liability (1970), pp. 199-213. (Hereinafter cited as Driver Behavior.)

policy issued or delivered within its jurisdiction.<sup>18</sup> Additionally, every person registering an uninsured motor vehicle in Virginia and South Carolina was required to pay a fee into the uninsured motorists fund. These fees were paid to liability insurers either to reduce or eliminate premiums paid by insured drivers for uninsured motorist insurance.

Prompted, perhaps, by failures among automobile insurers specializing in high-risk drivers, uninsured motorist coverage statutes have been enacted so widely that now only the District of Columbia, Maryland and North Dakota are without legislation mandating that such coverage be offered. However, in a majority of States the insured may reject the coverage. It is noteworthy that all three of the compulsory liability insurance States have passed such statutes, and New York is one of the 18 States which do not permit rejection of the coverage.

\* \* \* \* \*

It is clear that the principles of tort liability for negligence and the insurance aspects of the present reparations system had separate, independent origins,

- 
18. The scope of uninsured motorist coverage, at least as interpreted by the courts is considerably broader than originally formulated by the insurance industry. For instance, it is generally held that when a motorist was nominally insured at the time of the accident but somehow breached his policy's conditions, or suffered a rescission because he misrepresented certain material facts in his insurance applications, the victim's uninsured motorist insurance covers the loss. Again, where the wrongdoer's insurer becomes insolvent subsequent to an accident, the wrongdoer is often considered an uninsured motorist and the victim can collect under his uninsured motorist coverage. Many uninsured motorist statutes now specifically cover both points.

and that at least originally, interaction between the two was neither intended nor contemplated; it is equally clear that the universal adoption of financial responsibility measures, exerting varying degrees of compulsion to purchase automobile liability insurance, has made it impossible for either component of the system to revert to its former state or purpose.

U.C. BERKELEY LIBRARY

## **B. The Economic Consequences of Automobile Accidents**

Even a reasonably complete understanding of the performance of the auto accident reparations system requires that it be approached from several different perspectives. Thus, during the course of the Department's Study, the system's performance was examined from four vantage points:

1. that of the general public;
2. that part of the public making personal injury claims against auto liability insurers;
3. that part of the public filing suit for personal injuries; and
4. that part of the public killed or seriously injured in automobile accidents, whether or not a tort claim was made.

The main quantitative findings described in this section resulted from two separate study efforts. One examined a sample of personal injury liability claims settled by insurance companies over a two-week period in late 1969.<sup>1</sup> The other examined the losses and reparations of a sample of seriously and fatally injured victims during 1967.<sup>2</sup> Although it would have been preferable if both studies could have drawn their samples from the same population base and accident period, this was not possible. For example, no single sampling approach can economically develop the wanted data about both the run-of-the-mill accident and the serious accident. Quantitative differences in the way losses are distributed also argue for separate approaches. For example, although millions of people are injured annually in auto accidents, the number suffering truly significant injuries is relatively small. In the aggregate,

- 
1. U.S. Department of Transportation, Automobile Personal Injury Claims (1970).
  2. U.S. Department of Transportation, Economic Consequences of Automobile Accident Injuries (1970).

however, the losses of this group are extremely important. Moreover, recent research indicates that serious crashes may also be distinguished qualitatively in various associated phenomena, such as personality characteristics of the driver, traffic environment and other factors not yet clearly understood.<sup>3</sup>

In addition, the varying and frequently long times necessary for injuries to mature, for losses to be determined and for claims to be disposed of require a compromise between the need for fresh data and the need for complete data. And to the extent that completeness is sought, the fallibility of human memory introduces a further complication. Rarely does any one person have complete information concerning the circumstances surrounding the accident and its resulting losses.

Despite these difficulties, it is believed that the research results which follow present a valid "general" portrayal of the performance of the present reparations system.

1. Economic Loss Suffered by Automobile Accident Victims

Automobile accident losses can be divided into two broad categories. Intangible losses include those basically not susceptible to objective measurement in dollars, e. g., pain and suffering, mental or emotional disturbance, humiliation resulting from disfigurement, and bereavement over the loss of a loved one. Tangible or economic losses which can be measured in dollars, include medical expense, wage loss, and property damage. The Study's research focused mainly on economic loss although considerable information was also collected

3. David Klein and Julian Waller, Causation, Culpability and Deterrence in Highway Crashes (1970), for the U. S. Department of Transportation.

about the incidence of some of the more important (i. e., serious) kinds of intangible loss.

Most automobile accident victims, including those injured, do not, in fact, suffer major loss. As Table 6 and Table 7 illustrate, the majority of personal injury tort claimants incur no permanent injury and have economic loss of less than \$1,000.

TABLE 6

Indeed, only a small fraction of personal injury accidents accounts for the great bulk of economic loss, with 10 percent of paid tort claimants incurring two-thirds of all economic losses to date of settlement (Table 8). If lost future earnings had been calculable for all victims, their inclusion would cause the disproportion to be even greater.

On the average, slightly more than half of all paid personal injury economic losses to date of settlement were medical costs and about 40 percent reflected lost income.<sup>4</sup> However, in small cases (e. g., where economic losses were less than \$500) medical costs loomed larger, about two-thirds of the total, and income loss was less important accounting for less than a third of total losses. For very serious cases (e. g., with total losses over \$25,000) these relationships were reversed.

Seriously injured victims (excluding fatalities) had an average loss to date of interview (18 to 30 months after the accident) of \$4,200.<sup>5</sup> Of this amount, about 45 percent was wage loss, 38 percent medical expense, 12 percent property damage and 5 percent other types of loss.<sup>6</sup> These average loss figures by no means fully reflect the impact of wage loss for the more serious cases. Indeed, for half of the serious injury cases (excluding fatalities) involving any future wage loss, the indicated present (discounted) value of those losses averaged more than \$25,000.<sup>7</sup>

## 2. Compensation of Economic Loss

Tort recovery from auto liability insurance is one of the most important sources of compensation for personally injured automobile accident victims, although it

Indeed, only a small fraction of personal injury accidents accounts for the great bulk of economic loss, with 10 percent of paid tort claimants incurring two-thirds of all economic losses to date of settlement (Table 8). If lost future earnings had been calculable for all victims, their inclusion would cause the disproportion to be even greater.

On the average, slightly more than half of all paid personal injury economic losses to date of settlement were medical costs and about 40 percent reflected lost income.<sup>4</sup> However, in small cases (e. g., where economic losses were less than \$500) medical costs loomed larger, about two-thirds of the total, and income loss was less important accounting for less than a third of total losses. For very serious cases (e. g., with total losses over \$25,000) these relationships were reversed.

Seriously injured victims (excluding fatalities) had an average loss to date of interview (18 to 30 months after the accident) of \$4,200.<sup>5</sup> Of this amount, about 45 percent was wage loss, 38 percent medical expense, 12 percent property damage and 5 percent other types of loss.<sup>6</sup> These average loss figures by no means fully reflect the impact of wage loss for the more serious cases. Indeed, for half of the serious injury cases (excluding fatalities) involving any future wage loss, the indicated present (discounted) value of those losses averaged more than \$25,000.<sup>7</sup>

## 2. Compensation of Economic Loss

Tort recovery from auto liability insurance is one of the most important sources of compensation for personally injured automobile accident victims, although it

4. Automobile Personal Injury Claims, p. 29.

5. Economic Consequences, p. 1.

6. Ibid.

7. Ibid.

must be remembered that it is not designed or intended to compensate all victims. Therefore, the fact that many victims do not receive compensation from this system does not, by itself, mean that it isn't working as designed. For example, only 45 percent of all those killed or seriously injured in auto accidents benefited in any way under the tort liability system.<sup>8</sup>

Tort recovery, however, was found to be very unevenly distributed among successful personal injury claimants. As shown in the following table, claimants with losses to date of settlement of \$1,000 or less (89 percent of all paid claimants) sustained 33 percent of total losses and received 46 percent of total tort payments. Claimants with losses exceeding \$2,500 constituted slightly more than 3 percent of all claimants but sustained 45 percent of the losses and received only 31 percent of total payments. The inclusion of future wage losses would tend to increase the proportion of loss dollars in the larger loss categories.

Table 9 shows the percentage of fatally or seriously injured victims who were successful in obtaining compensation from the tort system and the degree of their success in relation to their economic loss.

TABLE 9  
COMPARISON OF REPARATIONS RECEIVED BY  
FATALLY OR SERIOUSLY INJURED PERSONS WITH  
AND WITHOUT TORT RECOVERY BY SIZE OF LOSS

Total Economic Loss	Percent with Tort Recovery	Ratio of Net Recovery to Loss	
		With tort	Without tort
\$1-499	54%	4.5	0.8
500-999	63	2.6	0.5
1,000-1,499	49	2.4	0.7
1,500-2,499	47	2.0	1.0
2,500-4,999	44	1.6	0.6
5,000-9,999	44	1.1	0.6
10,000-24,999	52	0.7	0.4
25,000 & over	42	0.3	0.3
TOTAL	48%	0.6	0.4

Source: Economic Consequences, p. 47.

When the economic loss was small, i.e., less than \$500, victims recovering under tort received an average of four and one-half times their economic loss. However, at the other end of the loss spectrum, when loss was \$25,000 or more, even successful tort claimants averaged a net recovery of only one-third of their economic loss.

Inconsistencies with the theory of tort recovery are apparent. For example, a greater proportion of victims recover under tort than would be expected in view of the fact that one-third of the accidents involve only one car.<sup>9</sup>

9. Ibid., p. 365.

Furthermore, while tort theory says that qualified (innocent) victims are entitled to compensation for all their losses, both tangible and intangible, even successful tort claimants with serious injuries, who presumably also suffered serious intangible losses, do not on the average recover even their economic loss.

One explanation for these anomalies is that most liability claims are not settled in court but are bargained to settlement by the claimant or his attorney and an insurance company. Even claims of doubtful merit have some value in this arrangement simply because of the administrative expenses associated with investigation and defense. Therefore, insurance companies are usually willing, particularly with small claims where the administrative expense is greater than the economic loss, to settle a questionable claim, or in insurance parlance, to "buy" the claim. The bargaining advantage tends to shift to the insurance company for larger value claims since it can better afford to wait for settlement than the victim who may be badly pressed financially.

Insurance policy limits also explain part of the low recovery rates by the seriously injured. For example, in the study of personal injury tort claims, the most frequently found coverage limit for auto bodily injury liability insurance (about 30 percent of all policies) was \$10,000/\$20,000,<sup>10</sup> which corresponds with the minimum financial responsibility laws of many states. Since recovery under the tort system is virtually dependent on the availability of insurance, low coverage limits are tantamount to low recovery potential for the victim. Uninsured motorists constitute another hurdle to recovery since uninsured motorists coverage and unsatisfied judgment funds almost always limit recovery to that stipulated in minimum financial responsibility laws.

---

10. Automobile Personal Injury Claims, p. 100.

There are, of course, other sources of compensation for automobile accident victims besides the liability system. Table 10 shows the frequency with which various reparation sources were used by fatally and seriously injured victims. About nine out of ten fatally or seriously injured victims obtained some compensation from at least one reparation source. Family medical insurance was the most common, closely followed by auto liability insurance.

TABLE 10  
SOURCES OF REPARATIONS FOR ECONOMIC  
LOSSES OF FATALLY OR SERIOUSLY INJURED  
AUTO ACCIDENT VICTIMS

Sources of Reparation	Percent Receiving Reparations
<b>Families' Insurance:</b>	
Medical	48%
Life	7
Auto Medical	35
Collision	30

Social Security Disability	2
Other	8
<b>Future Compensation:</b>	
Social Security	3
Other	1
<b>Total Receiving Some Reparation</b>	<b>91%</b>

Source: Economic Consequences, p. 43.

As shown below, the importance of each compensation source differed according to the size of the victim's

loss. Recovery from medical insurance, for example, increased relatively with size of loss except for very large losses. Wage replacement (e. g., sick leave, workmen's compensation, social security, etc.) became more important as the amount of loss increased. Policy limits or other limits on recovery affect collateral benefit sources as well as auto liability insurance.

TABLE 11  
PERCENT OF REPARATIONS RECEIVED AS  
COMPENSATION BY FATALLY OR SERIOUSLY  
INJURED PERSONS FROM SELECTED SOURCES,  
BY SIZE OF LOSS

Total Economic Loss	Medical Insurance	Life Insurance	Net Tort	Wage Replacement
\$1-499	4%	12%	74%	4%
500-999	10	7	60	13
1,000-1,499	11	6	57	6
1,500-2,499	10	23	38	13
2,500-4,999	15	6	40	12
5,000-9,999	18	1	39	17
10,000-24,999	20	6	42	20
25,000 & over	6	24	17	49
TOTAL	11%	14%	32%	27%

Source: Economic Consequences, p. 45.

In total, fatally or seriously injured victims received about a third of their benefits from tort recoveries, slightly more than one-fourth from various wage replacement sources, 11 percent from medical insurance and 14 percent from life insurance. Another 10 percent was received from other auto coverages, i. e., medical payments and collision.

As shown in Table 12, when recoveries from all sources are compared to all losses, it is still evident that the fatally or seriously injured victims with large

economic losses fare poorly relative to those with smaller economic losses. When net tort recoveries are compared to all losses, the results are even more dramatic. For example, victims whose compensable economic losses were under \$2,500 accounted for only 7 percent of the total loss but received 27 percent of the net tort payments. When recovery from all sources was considered, they received 19 percent of all benefits that society provided. By contrast, victims with economic losses in excess of \$10,000 suffered 77 percent of the losses but received only 51 percent of all benefits and only 36 percent of net tort payments.

Source: Economic Consequences, pp. 89-90 and 154-156.

As previously noted, fewer than one out of ten personal injury tort claimants dies or suffers permanent injury or disfigurement as a result of his accident. The following table shows the average liability insurance payment received by successful tort claimants and average economic loss to date of settlement by severity of injury. In every category the average payment was greater than the average economic loss "to date of settlement." These loss figures, however, do not include future lost earnings. Particularly in the two classes where

economic loss was greatest, the addition of lost future earnings presents an entirely different picture. The average total economic loss including lost future earnings was \$22,894 for fatalities and \$78,000 for permanent total disability cases.<sup>11</sup> Thus, the average recovery from tort of victims in these two categories was but a fraction of their average total economic loss.

TABLE 13

### 3. Timeliness of Payment and Attorney Representation

One important criterion for assessing the performance of any compensation system is timeliness of payment, i. e., the length of the period between the time an injury is sustained and the time some or all compensation is received.

<sup>11</sup> Ibid., p. 53.

One Departmental study explored how long it takes to settle all kinds of personal injury liability claims arising out of automobile accidents by examining claims settled during a given two-week period and then measuring the elapsed time back to the date of the accident. The following table shows that the number of claims disposed of increases proportionately faster than the settled losses or payments. This, of course, reflects the fact that small claims tend to be settled sooner, and perhaps with less controversy, than larger claims. Half of the claims were settled in less than six months after the accident. Half of the loss dollars involved in all claims had not been settled until more than a year had elapsed, and the same is true for total payments on these claims.

TABLE 14

CUMULATIVE PERCENTAGES OF PAID PERSONAL INJURY CLAIMANTS, LOSS DOLLARS AND PAYMENT DOLLARS BY ELAPSED TIME FROM ACCIDENT TO SETTLEMENT

Elapsed Time from Accident to Settlement	Cumulative Percent of:		
	Paid Claims Settled	Loss Dollars Settled	Benefits Paid

365	76	46	45
998	93	83	82

Source: Automobile Personal Injury Claims, p. 84.

Seriously injured accident victims or their survivors waited on the average 16 months for final payment. Table 15 indicates the expected positive correlation between the amount of economic loss and length of time to settlement. Final tort settlement took on the average one-half year longer for seriously injured victims with economic losses of \$2,500 or more than it did for persons with smaller losses.

TABLE 15

2,500 or more	19
All cases	16

Source: Economic Consequences, p. 52.

Partial interim payments to tort claimants in advance of final settlement is a technique used by many insurance companies to improve the timeliness of compensation. About 8 percent of fatality and serious injury cases received some kind of interim payments.<sup>12</sup> No substantial difference was discerned in elapsed time to final settlement between claimants receiving interim payments and those who did not receive interim payments.<sup>13</sup>

In the study of personal injury tort claims, 5.2 percent of all paid claimants received some payment in advance of settlement, such payments representing 2.5 percent of total payments and 6.4 percent of total losses. The following table indicates that as the amount of economic loss increases, the proportions of claimants and payment dollars covered by advance payments also tend to increase. However, the relative amount of loss dollars that are covered remains about the same for most sizes of loss, but drops substantially when losses exceed \$25,000.

12. Economic Consequences, p. 51.

13. Ibid.

TABLE 16  
PERCENTAGE OF CLAIMANTS, PAYMENT DOLLARS  
AND LOSS DOLLARS COVERED BY INTERIM  
PAYMENTS BY SELECTED SIZE OF LOSS

All Paid Claims	Economic Loss to Date of Settlement					Total
	None	\$501- 1,000	\$1,501- 2,500	\$5,001- 10,000	Over \$25,000	
Claimants	.9%	7.2%	11.5%	14.0%	13.3%	5.2%
Payments	.4	2.0	2.6	4.3	8.7	2.5
Losses	--	5.7	6.8	7.8	3.6	6.4

Source: Automobile Personal Injury Claims, p. 96.

Table 17, which presents the same data broken down by attorney representation, shows a greater utilization of interim payments for those claimants who do not have an attorney. When counsel was not retained, advance payments covered 7.7 percent of paid claimants, 7.8 percent of total payments and 17.2 percent of losses. On the other hand, when an attorney was present in the case (and the adversary climate thereby heightened), these percentages were significantly lower: 2.3 percent, 1.0 percent and 2.6 percent, respectively. The differences are even more dramatic when comparisons are made between comparable "size of loss" categories. Thus, for example, when attorneys were not retained and losses ranged between \$5,001-\$10,000, 36.5 percent of the claimants, 16.1 percent of the payment dollars and 26.2 percent of the loss dollars were covered by interim payments. But when victims with the same amount of loss employed attorneys, comparable utilization of interim payments was 7.5 percent, 1.3 percent and 2.4 percent, respectively.

TABLE 17  
PERCENTAGE OF CLAIMANTS, PAYMENT DOLLARS  
AND LOSS DOLLARS COVERED BY INTERIM  
PAYMENTS BY SELECTED SIZE OF LOSS  
AND ATTORNEY REPRESENTATION

Attorney Representation	Economic Loss to Date of Settlement					
	None	\$501- 1,000	\$1,501- 2,500	\$5,001- 10,000	Over \$25,000	Total
Without Attorney	.9%	17.8%	3.9%	36.5%	50.0%	7.7%
Claimants	.7	6.1	11.2	16.1	6.4	7.8
Payments	--	12.7	25.0	26.2	5.9	17.2
Losses

Claimants	.8	2.9	5.2	7.5	8.3	2.3
Payments	.3	.9	.9	1.3	9.6	1.0
Losses	--	2.9	2.7	2.4	3.6	2.6

Source: Automobile Personal Injury Claims, p. 96.

The time required to settle the tort claims of personal injury claimants is vastly different for those who retain an attorney and those who do not, with the latter's claims being settled much sooner. Claimants who retain an attorney but do not go to suit recover their losses more rapidly than claimants choosing to sue. Thus, while 86 percent of the claims were settled within six months of the accident when no attorney was present, less than 4 percent were settled in a comparable period when a suit was filed. In interpreting the data in the following table it should be remembered that while the split between claimants with attorneys and those without is about 50-50, the former suffered the bulk of total dollar losses.

**TABLE 18**

365	95	54	74	18
998	100	85	98	62

Source: Automobile Personal Injury Claims, p. 91.

The seriousness of a victim's injury is a significant factor in producing longer tort settlement times. Because permanent injury cases have higher average losses and because it takes time to establish the permanency of the injury, these claims take longer to settle than cases generally, as shown in Table 19.

#### **4. The Cost Efficiency of the Automobile Accident Liability System**

The economic efficiency or cost benefit performance of compensation systems can be approached from several perspectives. A common approach employed for automobile accident liability insurance is to measure how much of the premium dollar actually goes to the victim for benefits, or sometimes to the victim for benefits and the policyholder for legal defense services. The approach taken here adopts another perspective, that of society and what it pays for the support of the entire liability compensation mechanism as compared to what accident victims receive in terms of net benefits. This approach allows the inclusion of certain costs not paid for by premiums, such as the public costs of the court

system, and the exclusion of parts of the premium which are clearly neither expenses nor benefits of the compensation function, such as premium taxes.

 (b) See reference (d) of source to Table 20.  
 (c) Automobile Accident Litigation, p. 40.  
 (d) Loss adjustment expense ratios were applied to bodily injury and property damage premiums written by stock and mutual companies (from Aggregates and Averages (1969), pp. 129, 131, 203 and 205). A loss adjustment expense ratio of 9.6, based on the overall adjustment expenses reflected in Aggregates and Averages (1969), pp. 215 and 217, was applied to the bodily injury and property damage premiums

written as indicated by Best's Executive Data Service. Attorneys' fees and other litigation expenses were deducted from gross loss adjustment expenses incurred in order to avoid double counting.

(e) Estimated from premium and ratio data from the sources in the manner described in note (d) *supra*.

(f) Total investment expenses for stocks, mutuals, reciprocals and Lloyds were allocated on the basis of premiums written in Aggregates and Averages (1969). This should tend to understate actual costs attributable to liability coverages which contribute disproportionately to loss reserves.

(g) Automobile Accident Litigation, p. 7.

(h) Data on the costs of administering State financial responsibility laws were sparse and outdated. However, data for six states with approximately 26 million registered vehicles indicated a range of 18.6¢ per registered motor vehicle under a voluntary-type safety responsibility law to 57.4¢ per registered motor vehicle under a compulsory liability insurance law. Using 30¢ per motor vehicle as a conservative estimate of the cost of administering financial responsibility laws and a vehicular population of 99.6 million private and commercial motor vehicles in 1968, as indicated in U.S. Department of Transportation, 1968 Highway Statistics, total administrative costs approximated \$30 million.

(i) In 1967, total insurance regulatory expenses were estimated at \$40,456,444. (From Hearings before the Subcommittee on Antitrust and Monopoly of the Senate Committee on the Judiciary, 91st Congress, 1st Session, The Insurance Industry, Part 15 (1970), p. 8920.) Allocation of auto liability insurance was made on the basis of premiums written. This figure was used for 1968 expenses.

By dividing the total system expenses by system benefits, an estimate can be obtained of cost performance of the overall liability insurance system, i. e., how much it takes in total system expenses to deliver \$1 in net benefits to victims.

TABLE 22  
ESTIMATED COST/BENEFIT RATIO  
AUTOMOBILE LIABILITY INSURANCE SYSTEM

<u>Total System Expenses</u>		=	<u>\$3,768 million</u>	=	\$1.07
Total System Benefits			\$3,512 million		

Thus, according to this calculation, tort liability insurance would appear to cost in the neighborhood of \$1.07 in total system expenses to deliver \$1.00 in net benefits to victims.

This calculation, of course, does not address itself to the matter of the victim's need for benefits, i. e., whether auto liability insurance payments duplicate or overlap benefits from other sources, nor does it consider the need for, or quantitative appropriateness of, benefits for intangible losses. Both these and other matters become appropriate questions when cost efficiency is addressed from the victim's perspective.

One analysis addressing the cost efficiency of the automobile accident liability insurance system from the consumer's perspective has indicated that 44 cents out of every premium dollar collected is used to compensate accident victims for their losses.<sup>14</sup> Of this amount, 8 cents is duplicative of payments from other sources and 21 1/2 cents is used to pay for general damages

14. Robert E. Keeton, Automobile Insurance Reform Tailored to the Need, Statement Prepared for the Joint Committee on Insurance, Massachusetts, March 11, 1969, pp. 1-8.

(i. e., "pain and suffering" or intangible losses), leaving 14 1/2 cents to compensate for otherwise uncompensated economic losses.

This analysis indicates further that the remaining 56 cents is needed to operate the auto liability insurance system. General overhead -- including acquisition expenses, taxes and profit -- requires 33 cents from every premium dollar. Claims administration costs -- including salaries and fees for claims investigators, defense attorneys and plaintiff attorneys -- consume the remaining 23 cents.

### C. The Effects of Automobile Liability Insurance on Loss Reduction

#### 1. The Deterrent Effect of Automobile Liability Insurance

The tort liability system, resting on the concept of negligence, views most motor vehicle accidents and accident losses as the consequences of careless and avoidable driver behavior. Offenders are "guilty" of deviations from the standard of care exhibited by "a reasonable man of ordinary prudence," and consequently, are responsible for the reparation of losses suffered by "innocent" victims. Automobile liability insurance then shifts these losses from the "guilty" policyholders to their insurance companies, and thereby to all insurance policyholders -- guilty and innocent alike.

The belief that accidents, and by extension accident losses, stem from negligent driving behavior pervades not only the auto insurance system, but also other related institutions. Police efforts concentrate on guilt determination; the court system adjudicates disputes of fault and amounts of damages; licensing authorities attempt to remove deviant drivers through point systems and/or re-train traffic offenders through driver education instruction. All of these institutions attempt to "punish" the errant driver in order to deter or prevent him from future driving misbehavior, and, consequently, minimize accident losses and protect assets. Punishment may take the form of traffic citations from the police, fines or imprisonment from the courts, license suspension or revocation from motor vehicle departments and higher premiums, policy cancellations, etc. from auto insurers.

Unfortunately, the claim of a significant deterrent effect for the present automobile liability insurance system has so far proven unsusceptible to substantiation by empirical evidence. Nor does significant evidence exist to support the common belief that most accidents are

caused by improper and avoidable human error. Two investigations conducted during the course of the Department's study, however, indicate that most accidents are caused by environmental or personal factors which are external to the individual's conscious control and that punishment or its threat, therefore, is ineffective as a deterrent to deviant driving behavior.<sup>1</sup>

Analyzing the deterrent effects of various measures, including those of the tort liability system, one of these studies notes that existing deterrent measures fail to distinguish between two groups of drivers: those who are unwilling to conform to "normal" driving behavior and those who are willing but unable to conform.<sup>2</sup> The "won't conform" group consists of motorists who willfully choose to violate traffic laws -- who are able to modify their "bad" driving, but do not do so. Included in this group are those individuals who by virtue of their membership in deviant subgroups, are more likely to conform to deviant norms than to conventional driving norms (for example, certain youthful operators). For these relatively few drivers who deliberately choose to ignore safe driving practices, the threat of punishment will not, by itself, motivate careful driving behavior.

Motorists falling in the "can't conform" group attempt to exercise reasonable care when driving but, at times, are unable to do so.

"Some drivers are chronically unable to perform adequately, and all drivers have occasional non-

1. David Klein and Julian Waller, Causation, Culpability and Deterrence in Highway Crashes (1970), for the U.S. Department of Transportation (hereinafter cited as Causation, Culpability and Deterrence), and U.S. Department of Transportation, "The Human Factor in the Highway Environment: Normal and Deviant Behavior," Driver Behavior, pp. 111-198.
2. Causation, Culpability and Deterrence, p. 130.

deliberate lapses from adequate performance. The new and inexperienced driver, for example, regardless of his intentions and attitudes, will inevitably make errors . . . . Some of these errors will undoubtedly result in citations and crashes (as the disproportionate crash involvement of young drivers would seem to indicate), but to assume that these can be eliminated by deterrents is to assume also that the new driver is capable of a level of performance which in fact he has not yet achieved."<sup>3</sup>

Virtually all motorists are at times momentarily incapable of adequate performance because of the driving environment, their personal condition or some other factor beyond their control. Very few drivers, for example, are adequately trained to control their vehicles on icy surfaces. Where the driver is unable to avoid inadequate driving performance, deterrence is not likely to be effective since it demands behavior of which the driver is not capable.

Most accidents and violations are ascribed to driver error because it is the immediate, most obvious, cause. However, experts have concluded that the behavior involved in causation is itself the outcome of more remote causes.

"Driver error is only one of several factors that contribute to motor vehicle crashes. The individuals and groups who plan the vehicle and the highway environment also share responsibility for crashes and crash losses. No generally accepted criteria seem to exist by which causal factors may be ranked in importance. All that can be said in most cases is that if any one of the contributing factors had not been present, no crash would have occurred. Crashes may be more accurately viewed not as the result of

---

3. Ibid.

any single failure but as a result of the inability of the entire system to meet the demands placed upon it.<sup>4</sup>

Little has been done to identify or treat these underlying, more remote factors. For example:

"The scope of the tort law's inquiry into the cause of a particular crash is by established practice customarily limited to the behavior of the drivers, to the exclusion of other causal factors. The negligence law usually treats 'driver error' as both avoidable and unreasonable, and imposes liability pursuant to an objective standard to which all drivers are held. But a review of some of the available research indicates that a significant gap exists between the standard of behavior required by the negligence law and the average behavior normally exhibited by most drivers."<sup>5</sup>

As indicated in Table 23, doubts about the deterrent effect of the tort liability system are also raised by the general public's perception of the matter. When motorists were asked whether or not they believed that liability for damages caused by automobile accidents influences driving behavior, 58 percent replied negatively. Only 14 percent felt that liability does cause careful driving, with another 17 percent believing that it has some influence on driving. Respondents with some accident experience were even more likely than others to feel that liability has no effect on a person's driving, with nearly 70 percent of those involved in a personal injury accident holding this view.<sup>6</sup> Even those seriously injured in accidents tended to feel that potential liability does not affect how a person drives.

Liability has some influence	17	15
Liability makes no difference	58	53
Other	11	11
TOTAL	100%	100%

Source: Public Attitudes, p. 67, and U.S. Department of Transportation, Public Attitudes Supplement to the Economic Consequences of Automobile Accident Injuries (1970), p. 11. (Hereinafter cited as Public Attitudes Supplement.)

As noted earlier, the most significant bar to the deterrent effect of tort liability is the existence of liability insurance, i. e., since the potential tortfeasor may purchase immunity from any financial penalty arising out of a successful civil suit against him. Despite the arguments that the threats of insurance rate increases and policy cancellations for accident involvement deter negligent driving by insured motorists, the attitude survey of the general public indicates that the public is not responsive to such threats. Given a hypothetical accident in which their insurance company had to pay the other party more than \$200, nearly three-fourths of all respondents did not expect their company to raise rates and about 95 percent did not expect policy cancellation.<sup>7</sup>

7. Ibid., p. 113.

## 2. Utilization of Rehabilitation Techniques

It has been observed that "[s]ince the basic purpose of present day automobile liability insurance is protection of the policyholder, and since the basic principle of rehabilitation is service to the injured person, it is only that very special situation and that very special claimant in which the goals of rehabilitation and liability insurance coincide."<sup>8</sup>

Superficially, it would appear to be as much in the insurance company's interest as that of the victim and society as a whole that the victim be restored to his normal activities as quickly as possible. When a victim's losses are minimized by whatever means, the ultimate cost of a claim is likely to be lower. However, despite the seemingly clear interest of the company in rehabilitating automobile accident victims, obstacles to the optimum use of rehabilitation techniques in the settlement of auto tort liability cases still remain formidable, largely as a result of the adversary environment in which liability claims must be negotiated or adjudicated.

"Not only must fault and degree of disability be agreed to by opposing sides, but a bargain must be struck and dollar value assigned to the damages. Where the claimant has retained legal counsel, the settlement must cover his fees and expenses. The size of the attorney's fee is directly dependent on the size of the settlement, thus heightening the adversary nature of the settlement environment. Thus, considerable time, energy and expense must be devoted to controversy just when rehabilitation measures might most benefit the victim. The disabled person will usually be the focus of conflicting efforts toward the financial settlement of his 'case,' and here

8. John Henle, Rehabilitation of Auto Accident Victims (1970), for the U.S. Department of Transportation, pp. 18-19.

questions of fault and degree of disability press for immediate answer."<sup>9</sup>

The lost opportunities for rehabilitation were illustrated in the experience of seriously injured automobile accident victims. While a rehabilitation program was suggested to 11 percent of all victims,<sup>10</sup> the suggestion originated with insurance companies in only 2 percent of the cases.<sup>11</sup> Furthermore, about 30 percent of the victims did not participate in the rehabilitation program that was suggested.<sup>12</sup>

Not all auto accident victims require or can make optimum use of rehabilitation services, for example, those with only minor or no injuries. But the number who are potential candidates for formal rehabilitation programs, while small in relation to the total, would still appear to be quite sizeable. For example, in a recent survey about 7 percent of all claimants making successful auto bodily injury liability claims was found to suffer some kind of total or partial permanent impairment or disfigurement.<sup>13</sup>

When rehabilitation services are provided by the auto liability insurance system, they usually take one or more of the following forms:

- "1. the use of advance payments to cover the immediate expenses of the claimant, including, but not limited to, his property damage, hospital and other special damages;
2. the referral of the claimant to state rehabilitation agencies or other facilities; and
3. the use of claims or insurance company

9. Ibid., p. 13.

10. Economic Consequences, p. 377.

11. Ibid., p. 378.

12. Ibid., p. 379.

13. Automobile Personal Injury Claims, p. 19.

rehabilitation personnel working directly with the victim, his family, his physician and others to develop a plan of rehabilitation and to assist in its implementation and management."14

A relatively new insurance settlement technique of some significance to rehabilitation is that of advance payment, i. e., the partial payment of a claim in advance of final settlement. It is designed to provide timely compensation for the claimant's immediate expenses during his recovery period. Advance payments, to be most effective as a rehabilitative procedure, must be utilized with full knowledge of other benefits available to the victim. However, advance payments from automobile liability insurance are often made without regard to collateral benefit sources. The availability of such other sources may tend, in many cases, to reinforce the claimant's willingness to pursue an uncooperative, adversary approach to the liability insurer and hence to deter him from entering rehabilitation promptly.

In combination with advance payments, referral of victims to state rehabilitation agencies can be particularly effective. However, the state-federal rehabilitation program remains a major, virtually unused resource which has scarcely been tapped by the private auto insurance industry. A close and cooperative working relationship between claims representatives and claimants is perhaps the most effective but least often employed type of insurance-supported rehabilitation under the present tort liability system. This may be due, in part, to the pressures on adjusters for speedy closings of claims files. But even where insurance companies have sought to apply rehabilitation techniques to the settlement of third-party bodily injury claims, numerous obstacles remain, not the least of which is the credibility of the liability insurer's motives in the eyes of its third-party claimant.

---

14. Rehabilitation of Auto Accident Victims, p. 19.

#### D. Institutional Strains Created by the Reparations System

The existing auto accident reparations system has created or aggravated a host of stresses or strains for other institutions.

##### 1. Stresses Upon the Insuring Public

Perhaps the most pervasive influence upon automobile insurance as a public issue in recent years has been inflation. Indeed, between 1960 and 1970, the Consumer Price Index (CPI) for automobile insurance rose 63 percent, slightly more than twice as much as the CPI for all items.<sup>1</sup> As great as this rise is, it does not fully reflect the impact of rising auto insurance prices to the average household. During the 1960's, the number of multi-car families rose from 15 percent to 27 percent of all car-owning families,<sup>2</sup> with the result that auto insurance premiums became a noticeably more visible factor in the family budget.

This rise in the cost of automobile insurance was caused in large part by cost increases in the products and services which insurance pays for -- medical and hospital bills, crash repair services, legal services, wage and salary replacement, replacement of totally wrecked or stolen vehicles, etc. Doctors' fees and hospital daily service charges rose 58 percent and 155 percent, respectively, over the past decade, and there is good reason to believe that because of the nature of accident injuries, medical and doctor costs in this particular area rose even faster. Similarly, although the CPI for

1. Consumer Price Indexes are constructed and published by the U.S. Department of Labor, Bureau of Labor Statistics.
2. U.S. Department of Commerce, Statistical Abstract of the United States (1970), p. 546.

auto repairs and maintenance increased about as much as the CPI for all items, both available evidence and common sense argue that crash repair costs rose much faster during the past decade. (The Bureau of Labor Statistics does not collect data on crash repair costs.) Wage and salary replacement costs have paralleled the rise in personal income generally -- average weekly production worker earnings in the private sector, for example, grew 48 percent from 1960 to 1970.<sup>3</sup>

The costs of providing the insurance service, itself, have also increased very steeply, although not quite as fast as the external costs. Indeed, the insurance company's expense portion of the auto insurance premium dollar has declined from about 40.8 percent to about 39.0 percent since 1960.<sup>4</sup> However, it would probably be wrong to infer that this market decline in the expense ratio reflects any significant gain in the overall efficiency of the reparations system inasmuch as the CPI for auto insurance has been rising at double the rate of the CPI for all items.

Regardless of the reasons for rising insurance prices, the fact that they are rising cannot be ignored, nor can the widespread public dissatisfaction which has accompanied it. While all insured motorists are required to pay into the insurance system, not all realize tangible benefits from it. Understandably, those who are lucky enough not to have been involved in accidents are also likely to become bitterly resentful of increasing insurance costs. Also, understandably, they will feel that only those who cause or are most likely to cause accidents (traffic law violators) should pay such increased costs. Setting aside for the moment the fallacy of the assumption that most accidents are caused by a small

3. Earnings data are collected and published by the U. S. Department of Labor, Bureau of Labor Statistics.

4. New York Insurance Department, Loss and Expense Ratios, Insurance Expense Exhibits (unaudited).

percentage of "bad" drivers who alone have difficulty in obtaining insurance voluntarily, it is clear that when the cost of insurance reaches the point where it strains a driver's ability to pay, he may either drive without insurance or opt for deficient coverage (as a means of effecting premium savings) to the detriment of his potential accident victim, or cease to drive and perhaps thereby impair his ability to earn a living. In a similar vein, drivers involved in accidents may be encouraged under merit or demerit rating plans to abstain from reporting accidents to their insurers and thereby risk a denial of coverage because of a policy breach. "Policyholder reluctance to report an accident appears to arise from a fear that his possible liability will have an adverse effect on the price and availability of automobile insurance to him in the next period."<sup>5</sup>

## 2. Stresses Upon the Insurance Industry

Combined with, and influenced by, the increased demand for insurance -- stemming in large part from more stringent financial responsibility measures, a growing population, increasing numbers of vehicles and a greater use thereof, and the introduction of more liberal concepts of legal liability and damages -- the inflationary spiral has been the overriding reason for widespread and frequently severe underwriting losses of automobile insurers and, consequently, for the insurance price and availability problems that have followed in the wake of unprofitability.

The insurance product is perhaps unique in that its cost to the producer can only be ascertained long after it has been sold and used. Thus, actual loss experience, which largely determines the loss component of the

- 
5. U. S. Department of Transportation, An Analysis of Complaints in Selected Automobile Insurance Markets (1970), p. 25. (Hereinafter cited as An Analysis of Complaints.)

product's price, will be established only after the last claim under the last policy issued during a given period has been settled. Therefore, in structuring its rates, the automobile liability insurer or rating organization must estimate not only what its losses will be for accidents covered by policies issued at some future time, but also what those loss costs may grow to when the claims are actually settled. Obviously, if the effects of inflation cannot be predicted with reasonable accuracy, then the rates may turn out to be disastrously inadequate.

The pricing of the insurance product is made immensely more complicated by the fact that under most State rate regulatory laws the insurer or rating organization proposing new rates must first secure the approval of the appropriate State insurance regulatory official. During this process, however, controversies may arise between regulators and insurers over the so-called "development" and "trend" factors which insurers use to project past loss experience into a forecast of future loss experience. Disagreements are particularly likely to occur when past experience indicates an acceptable loss ratio at current rate levels, but an excessive loss ratio when modified by the insurer's development and trend factors.

Clearly, reasonable minds can and will differ about what the future will bring; and even if all can agree that loss experience will trend upward, there may well be disagreement about the extent. Where the regulator declines to accept, in full or in part, the insurer's gloomy predictions of the future, the courts are unlikely to overturn his decision unless it is manifestly arbitrary, capricious and without any evidence to sustain it. It is scarcely a matter of wonder, then, that insurers, their associations and rating organizations are virtually unanimous in their denunciation of prior approval rate regulatory laws and have urged that they be replaced with a system that relies on competition alone to keep rates at reasonable levels.

### 3. Pressures Affecting the Residual Market

When an insurance company becomes convinced that the rates it is allowed to charge are inadequate to cover the expected losses of a specific group of its insureds, it understandably becomes more selective in accepting new applicants and attempts to drop those policyholders for whom the rates have become inadequate. As this attitude spreads to more insurers, increasing numbers of drivers find insurance unavailable in the voluntary market and are forced to seek coverage with assigned risk plans or the high-risk (non-standard) market. It is understandable, therefore, that a regulator, torn between granting unpopular rate increases and the market constrictions likely to follow the denial of requests for rate increases, might well opt for abandonment of the prior approval type of rate regulatory law -- particularly when there is hope that once "adequate" rate levels are attained, price competition among insurers will work effectively to keep rates at proper levels.

Competition, itself, apart from considerations of adequate rate levels, engenders market problems that increase the population of the assigned risk plans and the non-standard insurance market. It has been observed:

"The hard-to-place [driver] problem is an integral part of the competitive functioning of the automobile insurance industry. It is a by-product of underwriting competition. Despite a complex objective rating scheme, insurers do not find it profitable to grant coverage to all applicants. Even within the most highly developed rating classification there are still some drivers who have distinctly higher than average loss potential. Insofar as the rating system fails to account for these differences, there is an opportunity for insurers to increase their profits through selective underwriting. The result of this is that some applicants are rejected. This residual group of rejected drivers is likely to become larger as

competition becomes more intense. The more insurers' profit margins are under pressure, whether for competitive or regulatory reasons, the greater their efforts to sort out applicants with higher than average loss potential. Cancellations and refusals to renew are manifestations of these efforts. . . . The existence of a substandard or hard-to-place market appears to be inevitable in the context of a fully competitive insurance system. Only by placing restrictions on competition through underwriting could such a residual market be reduced in size or eliminated. Because risk variations in the driving population exceed the scope of any feasible rate classification systems, insurers will have a profit incentive to reject the poorer risks within each class. Thus, the substandard market is not based on unusual or temporary factors in the insurance industry; rather, it is a basic result of competition. "6

In competing for new business, only the better risks are solicited:

"Competition and regulation together have caused insurers to intensify their search for preferred risks. As a consequence, underwriting practices have become progressively more refined. This refinement has led to an increasing degree of insurance price variability designed to reflect more precisely loss variations among motorists. Insurance classification systems can be viewed as a blend of risk differentiation and risk pooling. A highly detailed classification system places the greatest weight on differentiation -- a driver pays that premium which reflects his loss probability as of that time and place. As his age, driving habits, or location changes, his premium will change, perhaps drastically. "7

6. Insurance Accessibility, pp. 1 and 22.

7. Ibid., p. 21.

While the eight to ten percent<sup>8</sup> of insured motorists who are relegated to the involuntary market do not represent a high proportion of the total, translated into absolute terms against a background of about 100 million vehicles, the true significance of the hard-to-place driver problem can be seen. Originally conceived as the solution to the insurance availability problem, assigned risk plans currently serve no more than half of the non-standard market.<sup>9</sup> Many hard-to-place drivers, desiring broader coverages and higher liability limits than those provided by the plans, have chosen to insure with high-risk companies. Unfortunately, some of these motorists have been insured by high-risk companies that later became insolvent.

In retrospect, it might be easy to condemn State regulators for permitting some of the high-risk insurers to operate, or to operate as long as they did, before their financial collapse. Such condemnation, however, would overlook the pressures upon regulators to take the optimistic view during times when some motorists were unable to purchase insurance in the voluntary market and rebelled at being consigned to the assigned risk plan (i. e., because of the social stigma attached to it), or could not use such plans because of ineligibility or the need for higher limits or other coverages.

Over and above the high rate of insolvencies, policies written by high-risk insurers have been noted for coverage gaps, restrictive provisions and arbitrary or capricious denials of liability. The cruelest and most intolerable consequences of insurer insolvencies and coverage deficiencies are borne by the innocent accident victim who is deprived of reparation for his injuries by circumstances completely beyond his control. However meticulous and deliberate the accident victim may have been in choosing his own insurer under the tort liability

8. Ibid., p. 2.

9. Ibid.

system, he cannot select the tortfeasor nor the tortfeasor's insurer. In the case of small claims, at least, the accident victim is usually without remedy as a practical matter:

"For small claims, the existence of formal court procedures is an empty alternative for enforcing reparation by a hesitant insurer. With court delays in excess of five years in some major metropolitan areas, and with the expenses inherent in utilizing the courts, application for judicial enforcement of small obligations may be precluded."<sup>10</sup>

Ruinous financial losses also may be sustained by policyholders left unprotected by an insolvency or coverage gap.

The understandable inclination of a third-party claimant confronted by a seemingly capricious denial of liability by the wrongdoer's insurer is to seek relief from the complaints division of his State insurance regulatory agency; but the fact is that complaints divisions cannot act as formal judicial bodies since they lack legal authority to make binding determinations of law or fact and cannot assume the power and functions of the judiciary.<sup>11</sup>

The change of an insured's status from that of a "preferred risk" to that of an undesirable or "high" risk may be both precipitate and costly, as, for example, when a youthful member of the family attains driving age or when a chargeable accident has been incurred. In most cases, an insurer, other than a high-risk insurer, will not voluntarily sell insurance to a person who has been

<sup>10</sup> An Analysis of Complaints, p. 15.

<sup>11</sup> In this connection, it may be noted that California, which has received widespread praise for the excellence of its insurance regulation, does not even entertain complaints from third-party victims of automobile accidents.

cancelled or refused renewal by another company. Therefore, when a driver discloses on his application that he has been previously cancelled or refused renewal, his rejection, and consequently his need to resort to the assigned risk plan or the non-standard market, is almost certain -- whatever the reason for the cancellation or nonrenewal may have been. This, to a great extent, accounts for the numbers of clean risks in assigned risk plans.

No one would argue, of course, that motorists who consistently violate the laws and endanger lives should not be eliminated from the highways; but it could be argued that the decision to remove such motorists should be made by government and not indirectly through a pricing mechanism operated by a private industry, particularly where the driver's only offense has been his inability to obtain insurance in the voluntary market. The following summary places the matter in perspective and draws attention to the public policy implication of insurance pricing:

" . . . [T]he hard-to-place problem is not a temporary phenomenon in the context of the automobile insurance industry. It is an inevitable but undesirable consequence of the competitive process. If we are to allow competition in underwriting to continue, because of the social nature of automobile insurance, we must devise alternative means to serve the hard-to-place driver. . . . [A] major social decision will have to be made, particularly with respect to insurance pricing. Insurance costs are of a magnitude that ability to pay cannot be ignored. Given its compulsory nature, considerations of social equity must be featured."<sup>12</sup>

Even those who advocate substantial retention of the tort liability reparations system concede that some

---

<sup>12</sup>. Insurance Accessibility, p. 85.

reforms are needed, and these have their own important cost implications. Thus, for example, the American Bar Association has recommended such changes as universal, compulsory liability insurance, substitution of comparative negligence for contributory negligence, elimination of immunities such as the charitable institution rule and inter-spousal and intra-familial immunities, and the removal of statutory limitations on damages in wrongful death cases.<sup>13</sup> The Defense Research Institute and many insurers and their associations have offered similar or comparable reforms as alternatives to a more far-reaching restructuring of the system. The important point here is that whatever the merits of such changes may be otherwise, some or all would act to increase still further the cost of automobile insurance.

#### 4. Stresses Upon Law and Legal Institutions

The truth of the maxim that "justice delayed is justice denied" is nowhere more apparent than it is with automobile accident cases. The combination of pressing financial obligations and the prospect of long delay in the trial of the issue may force the injured accident victim into a settlement of his claim which is totally incommensurate with his economic loss and the liability of the wrongdoer.

Of the more than 220,000 lawsuits estimated to have been filed in 1968 as the result of motor vehicle accidents, more than half required in excess of two years to reach termination.<sup>14</sup> The true dimensions of the problem may, perhaps, be better seen from a geographical perspective. In small rural counties such as Pittsylvania, Virginia, or Simpson, Mississippi, for example, half of the suits filed appear to have been disposed of within four or six months. In large urban counties such as New York, Los Angeles or Essex (Newark), it may require 48, 26 or 30 months for half of the cases to

13. See, ABA Report.

14. Automobile Accident Litigation, p. 7.

terminate and 70, 56 or 36 months to dispose of 90 percent of the cases.<sup>15</sup>

Much of this delay can be traced to the adversary nature of the settlement process under the tort liability system and the pervasive reliance on lump sum payments to the successful litigant or claimant. Meaningful settlement negotiations cannot take place until the claimant has had a chance to assess the extent of his losses and injuries; in the case of serious injuries some lengthy period may have to elapse before this assessment can be made. Normally, a suit will not be filed until the extent or permanency of the injury has been finally determined or until the statute of limitations threatens to bar the suit. For this reason, suit filings tend to cluster around the expiration of the time provided by the statute of limitations.<sup>16</sup>

Even though it was found that only 7 percent of the suits filed were terminated through verdict and judgment,<sup>17</sup> it is not true that only relatively few cases are affected by court delay. Rather, it seems clear that settlements tend to be reached as the trial date nears. "The fact that delay from filing to termination for the median of all terminated cases closely resembles the delay for the median of all tried cases supports the thesis that establishing a trial date determines when a case will terminate whether it goes to trial or not."<sup>18</sup> The indicated tendency toward "settling on the court house steps" may well be explained by the fact that of the cases examined 71 percent were won by plaintiffs.<sup>19</sup>

The burden that accident litigation places on the judiciary is indicated by the finding that:

---

15. Ibid., pp. 88-248.

16. Ibid., pp. 26-33.

17. Ibid., p. 8.

18. Ibid., p. 33.

19. Ibid., p. 37.

"Motor vehicle accident litigation in the court system was estimated to occupy 17 percent of the system's available resources. The court costs of administering accident litigation was estimated at \$133.7 million considering employee and operating expenses in both state and federal courts. Impact of motor vehicle accident litigation on the courts varies widely among states (from 3% to 46%)."<sup>20</sup>

It should be noted that this assessment relates only to the tort liability aspects of the system and does not consider the impact of the considerable volume of litigation which stems from coverage disputes and issues.<sup>21</sup>

Criticism of the auto accident reparations system growing out of court delays has attained such proportions that compulsory arbitration of smaller cases is being widely advocated even though advocates generally oppose any change which would impinge upon the right of jury trial. The Philadelphia Plan, for example, has been widely studied as a model. This Plan compels the arbitration of claims involving less than \$3,000 but allows a

20. Ibid., p. 7.

21. These include: declaratory judgment actions relating to which, if either, duplicating policy applies or whether one is primary and the other excess; rescission actions brought by insurers to void policies because of alleged misrepresentations of the applicant in his application for insurance; actions for the interpretation of exclusionary provisions in liability policies, and for a determination whether such exclusions offend the letter or spirit of financial responsibility laws; controversies over "offsets" and "escape" clauses in uninsured motorist insurance policies and endorsements, with particular respect to whether or not such clauses are void as being in conflict with statutory provisions mandating uninsured motorist insurance as a part of every liability policy, and similar coverage questions.

losing party to obtain a trial de novo on payment of arbitration costs and certification that the appeal to the court is not merely for the purpose of delay. However, the American Bar Association has cautioned against depriving the litigant of the right of trial by jury by penalizing court appeals.<sup>22</sup>

Those who recommend such "evolutionary" reforms as elimination of the inter-spousal, intra-familial, charitable and governmental immunities are merely echoing pronouncements already made by many of the courts in judicially striking down these immunities. That the court's action in terminating such immunities is prompted by the desire to afford reparation to the victim under the fault-liability insurance reparations system is implicit, and sometimes explicit.<sup>23</sup>

The Illinois Supreme Court has well articulated the role of automobile liability insurance as a vital component of the tort reparations system in holding that failure

---

22. ABA Report, p. 61, where the Committee concludes:

"In these [plaintiff v. defendant] situations we believe that the courts should not abdicate their usual role. The emphasis should be on efforts to improve their ability to do their work on time, to make certain that litigants have easy access to the courts for the resolution of their controversies by professional judges, and to preserve the right of trial by jury, in fact and in theory." The Report suggests that the panels are pro-plaintiff and that "plaintiff's lawyers" may outnumber "defendant's lawyers" by 30 to 1.

23. For example, in Silesky v. Kelman, 161 N. W. 2d 631 (Minn. 1968) where the court said: "While the existence of liability insurance does not create liability, its presence is of considerable significance in the case at bar. To persist in adherence to family harmony and parental discipline and control arguments when there is automobile liability insurance involved is in our view unrealistic."

of the insured to give the required notice of accident did not vitiate coverage where the injured person himself gave such notice to the insurer. The court said:

"Automobile insurance has taken an important position in the modern world. It is no longer a private contract merely between two parties. The greater part of litigation in our trial courts is concerned with claims arising out of property damage, personal injury or death caused by operation of motor vehicles. The legislatures of all of our States have recognized the hazards and perils daily encountered and as a result have enacted various pieces of legislation aimed at protection of the injured party. Financial Responsibility Acts, Unsatisfied Judgment Fund Acts and other similar laws are direct results of this concern. That the general welfare is promoted by such laws can be little doubted. Government and the general public have an understandable interest in the problem. Many persons injured and disabled from automobile accidents would become public charges were it not for financial assistance received from the insurance companies."<sup>24</sup>

Courts have regularly rested the moral and legal justification of compulsory insurance and financial responsibility laws upon the danger that innocent accident victims might, in the absence of reparation by the wrongdoer's insurer, become a burden upon society. The logic of this justification is quite apparent since it would seem that government would lack the right, and possibly the power, to require a citizen to purchase automobile liability insurance merely to protect his personal estate, particularly where no attempt is made to require protection of that estate from liabilities arising from activities other than operating a motor vehicle. However, viewing the matter in terms of society's interest in preventing a

<sup>24</sup>Simmons v. Iowa Mutual Casualty Co., 121 N. E. 2d 509 (1954).

victim from becoming a public charge, it would appear that the at-fault victim and his dependents are quite as likely to become public charges as the innocent victim.

Widely divergent, even antithetical, public policies are displayed by different jurisdictions with respect to allowing the alleged wrongdoer's insurer to be named as a defendant and the real party in interest in a liability suit against a putative wrongdoer. In the overwhelming majority of States, the defendant's insurer may not be named or joined as a defendant in the principal suit. Indeed, it is usually deemed prejudicial error, requiring a mistrial or reversal, if mention of liability insurance is injected into the trial by or in behalf of the injured plaintiff. This rule, of course, is based upon the probability that the jury, sympathetic to the injured person's plight and the insurer's wealth, would find for the injured plaintiff irrespective of the defendant's liability or lack of it.

In those States that uphold the "no-action" clause of the insurer's policy, the claimant is not entitled to bring action against the insurer unless final judgment has been secured against the insured, and unless the insured has complied with all of the terms of the policy. The result is, of course, that the third-party claimant is, until he obtains a judgment, a stranger to the insurance contract and to the insurer. If the insurer ignores the claimant, is dilatory in its handling of the claim, or fails to make an adequate, or any, offer of settlement, it violates neither a contractual nor a statutory obligation owed to the claimant. Obviously, in the overwhelming majority of cases, the insurer expeditiously investigates the claim and negotiates a settlement because it is good business to do so. There are indications, however, that some high-risk insurers have taken advantage of this absence of a legal obligation and have abused accident victims.<sup>25</sup>

---

25. An Analysis of Complaints, p. 59: ". . . [T]he conclusion that the behavior of nonstandard insurers tends

In two States, Louisiana and Wisconsin, statutes explicitly recognize the right of the injured plaintiff to name or join the liability insurer as a defendant in the principal suit. In such jurisdictions, of course, the "no-action" clause is void as being contrary to public policy. Recently, the Supreme Court of Florida recognized the plaintiff's right to join the liability insurer as a defendant even though Florida does not have a "direct action" statute. In so concluding, the Court said:

"It cannot be disputed that securance of liability insurance coverage protection for the operation of a motor vehicle . . . is an act undertaken by the insured with the intent of providing a ready means of discharging his obligations that may accrue to a member or members of the public as a result of his negligent operation of a motor vehicle on the public streets and highways of this state. Viewed in this light, we think there exists sufficient reasons to raise by operation of law the intent to benefit injured third parties and thus to render motor vehicle liability insurance amenable to the third party doctrine."<sup>26</sup>

It has been cogently observed that:

"When the negligence principle was taking root the question of tort liability was a matter between individuals. When an accident caused loss, the law saw only two possible ways to deal with it: let it lie where it had fallen, or shift it to the party who had caused the loss . . . [T]he possibility of broad distribution of the loss according to insurance principles had not yet been thought of in this context."<sup>27</sup>

---

to lead to greater than normal dissatisfaction on the part of claimants is difficult to avoid."

26. Shingleton v. Bussey, 223 So.2d 713 (1969).

27. Fleming James, op. cit., p. 45.

Legal principles, enjoying complete logical and moral justification in the environment of a tort action, can make an expensive shambles of a reparations system based upon insurance principles. The collateral source rule on damages aptly illustrates the point. The collateral source rule prevents the negligent defendant from decreasing the damages recoverable by the plaintiff by showing that the latter recovered his losses from some other benefit source, the theory being that it would be unjust to allow the wrongdoer to reap the reward of the plaintiff's bargain and thus to escape the consequence of his own wrongdoing. In the context of a reparations system based upon insurance principles, the rule lends itself to duplication of recovery resulting in the excessive compensation of minor injuries and excessive costs for the system.

Conversely, the impact of the auto accident reparations system on the law also can be illustrated by the collateral source rule. Strict application of the collateral source principle might prevent a liability insurer which has paid the medical expenses of its insured's guest passenger under the medical payments insurance (a contractual coverage) from precluding the same claimant from claiming those same medical expenses in a tort action against the host driver. Some courts have applied the rule strictly. In one case, the New Jersey Supreme Court said:

" . . . [W]e see no reason to deviate from the general rule insofar as the payments for medical and hospital expenses are concerned merely because the [tortfeasor] husband paid the premiums. This does not affect the common law rule that a tortfeasor may not benefit by payments to the injured party from collateral sources. Plaintiff was the direct contractual beneficiary of these policies which vested her with a property right."<sup>28</sup>

<sup>28</sup>. Long v. Landy, 171 A.2d 1 (N.J. 1961). Also see Edmondson v. Keller, 401 S.W.2d 718 (Texas 1966).

Perhaps a majority of the courts have held, however, that where the medical expenses have been paid by the host driver's liability insurer under the medical payments coverage, the situation is essentially the same as though payment of such expenses had been made by the wrongdoer himself and, therefore, the collateral source doctrine has no applicability.<sup>29</sup>

Finally, in considering the impact of the fault' reparations system upon the law and legal institutions, note must be taken of the concern which scholars and others have expressed about the growing disrespect for the courts and the law. As one scholar put it:

"An undesirable by-product of this wastefulness is that it encourages exaggeration<sup>30</sup> of injuries suffered,

29. For example, see Tart v. Register, 125 S.E.2d 754 (N.C. 1962); Yarrington v. Thornburgh, 205 A.2d 1 (Del. 1964). By definition, the collateral source doctrine can only apply where the payment was from a source independent of the wrongdoer.

30. Aside from any tendency of the system to encourage the exaggeration of injury and the prolongation of disability, there are disturbing indications that complete physical recovery may itself be jeopardized by the pendency of suit. See Crawford Morris, "Response to Ribicoff: Malpractice Suit v. Patient Care," Insurance Counsel Journal (April 1970), p. 224, where the author writes: ". . . [T]here is the known medical fact that patients who become plaintiffs in any type of litigation seeking money damages for their injuries simply do not recover as completely or as quickly as similar patients not embroiled in litigation." Mr. Morris quotes Dr. Wallace Duncan, a renowned orthopedic surgeon as saying: "I despair to undertake the treatment of any patient who has litigation pending -- they simply do not respond to therapy as they should and do not recover as quickly nor as completely as similar patients who do not have such litigation pending."

and even fraud and perjury, in order to ensure that the amount which actually reaches the victim is large enough to compensate him for his real losses."31

In somewhat the same vein, Dean Prosser has stated:

"Upon such evidence, a jury of twelve inexperienced citizens, called away from their other business if they have any, are invited to retire and make the best guess they can as to whether the defendant, the plaintiff, or both were 'negligent' which is itself a wobbly and uncertain standard based upon the supposed mental processes of a hypothetical and non-existent reasonable man. European lawyers view the whole thing with amazement; and the extent to which it has damaged the courts and the legal profession by bringing the law and its administration into public disrepute can only be guessed."32

31. Joseph W. Bishop, "The Validity Under the Constitution of the United States of Basic Protection Insurance and Similar Proposals for the Reform of the System of Compensating Victims of Automobile Accidents," Constitutional Problems in Automobile Accident Compensation Reform (1970), U.S. Department of Transportation, pp. 37-38.
32. William Prosser, op. cit., p. 580.

**E. Public Opinion: Complaints and Attitudes about Automobile Insurance**

Increasingly vocal public concern over the operation of the automobile insurance system has been a major force in attracting the interest of government at all levels. Indeed, public concern led to the creation of the Department of Transportation's Automobile Insurance and Compensation Study.

Any institution that directly and substantially affects the lives of three out of every four American families is bound to generate at least some consumer dissatisfaction. During the course of the Study, the Department became a natural collection point for citizen complaint letters about auto insurance. A selection of these letters were sent to the companies involved for comment. The complainants were contacted and asked for additional information.<sup>1</sup>

It is an indication of how strongly these complainants felt that 80 percent of them responded even though they were advised that the Department of Transportation had no power to assist them.<sup>2</sup> About 40 percent of these complainants considered their complaints still open, despite the fact that many were concerned with matters several years old. Only 26 percent of those that believed their complaints were resolved felt justice had been done.

Although no formal adjudications of the facts in dispute could be made, many of these complaints appeared to be unwarranted in the context of the present insurance system. Others reflected gross misconceptions about the operation of the system or the respective rights of insureds, claimants or insurance companies. Many of the complaints, however, did appear to be justified. In some cases, the company admitted error and frequently

1. Public Attitudes, pp. 137-266.

2. Ibid., p. 140.

gave evidence of going to considerable lengths to rectify it. In still other cases, neither the company nor the complainant appeared, either in a legal or moral sense, to be completely "right."

One study of consumer complaints about automobile insurance indicated that non-standard (i. e., high-risk) companies are responsible for a disproportionate number of complaints. This study, based on the experience of four jurisdictions -- California, Illinois, West Virginia and the District of Columbia -- revealed that while high-risk companies had from 5 to 11 percent of the market, their share of complaints ranged from 14 to 48 percent of the total analyzed.<sup>3</sup> While the distribution of complaints by type varied from one jurisdiction to another, delay of claims payment, disputes of the value of the loss and denial of coverage accounted for slightly over 70 percent of all complaints.<sup>4</sup>

One of the Department's principal concerns was to find out what the public thinks and feels about the present automobile insurance system. To this end, two large-scale surveys were conducted, one of the general public and the other of persons known to have been seriously injured in automobile accidents.<sup>5</sup> In general, these surveys indicate that the public has mixed attitudes about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system.

When respondents to the survey of the general public were asked to mention what they felt were the good and bad points of auto insurance, most mentioned both kinds of features. However, while most references to desirable features were couched in the form of generalities,

3. Insurance Accessibility, p. 70.

4. An Analysis of Complaints, p. 10.

5. See, Public Attitudes and Public Attitudes Supplement.

references to undesirable features tended to be specific, relating to rising costs, fear of cancellation and delays in the settlement of claims.<sup>6</sup> Only 8 percent of the general public could think of more than one favorable point and 17 percent were unable to think of any; however, 27 percent mentioned two or more unfavorable features while only 12 percent could think of none. The most frequently stated undesirable aspect of auto insurance was high or rising cost (44 percent of all respondents), policy cancellation or nonrenewal (11 percent), and delay in claims processing (10 percent). Protection against claims by others or against large loss (37 percent) -- a function which perhaps could be equally well provided by alternative systems -- and good service (12 percent) were most frequently mentioned as good points.

A motorist's level of satisfaction with the system might logically be expected to be related to his experience with it. As reflected by an Index of Satisfaction -- a measure combining the responses to several questions<sup>7</sup> -- respondents with personal injury accident experience during the two-year period prior to the interview, either personally or by association with another family member, tended to be less satisfied than respondents with property damage or no accident experience (Table 24). One likely explanation is the widespread possession of collision insurance that pays auto damage costs without regard to fault and also facilitates third-party recovery. Indeed, the Index shows that the level of satisfaction for persons with first-party claims is significantly greater than that of third-party claimants (Table 25).

6. Public Attitudes, pp. 24-25.

7. For a discussion on the Index of Satisfaction, see Public Attitudes, pp. 15-31.

**TABLE 24**  
**INDEX OF SATISFACTION OF THE GENERAL PUBLIC**  
**WITH AUTO INSURANCE BY TYPE OF AUTO ACCIDENT**  
 (Percentage distribution of car-owning families)

Level of Satisfaction	Type of Accident		
	Personal Injury	Property Damage Only	No Accident

The Index also reflects the much greater degree of dissatisfaction with auto insurance on the part of motorists living in the central cities of the twelve largest Standard Metropolitan Statistical Areas (SMSA's) as compared to those living in all other sections of the country (Table 26). The relatively high cost of automobile insurance protection in urban areas, the problem of court delay and the greater difficulty in obtaining and keeping insurance are all reasonable explanations for the differences.

When asked whether they had ever personally experienced cancellation or nonrenewal, 14 percent of the car-owning families replied affirmatively.<sup>8</sup> Excluding those motorists who were themselves cancelled, more than half of all respondents, particularly youthful motorists, had heard of others who had been cancelled. Most respondents who were cancelled or denied renewal purchased other insurance, but low income people were

8. Ibid., p. 35.

more likely than others to go without insurance after a cancellation.<sup>9</sup>

One of the more important observations to be drawn from this survey of the general public was that a substantial number of motorists do not clearly understand how the fault system is intended to work. Nearly 30 percent of all respondents believed that they could collect from a third-party insurer when partly at fault in an accident with another driver.<sup>10</sup> Another 14 percent did not know whether they could or could not collect. Those with significant direct recent experience with the system, in this case seriously injured victims, showed a better understanding of the fault doctrine with only 21 percent replying incorrectly and 12 percent not knowing.<sup>11</sup>

A comparison of the seriously injured victims' responses with those of the general car-owning public to a series of attitudinal questions on the reasons for carrying automobile insurance indicates that the former tend to attach greater relative importance to all reasons.<sup>12</sup> One of the largest differences between the two groups concerned their feelings about compensation for "pain and suffering" caused by an accident. Sixty-four percent of the seriously injured victims considered this a "very important" reason for carrying auto insurance, while only 46 percent of the general public expressed the same attitude.<sup>13</sup> Fifteen percent of the general public thought it was "not at all important," but only 7 percent of the seriously injured victims agreed.

As the interview developed and respondents gained additional knowledge of the present system and a possible

alternative to it (i. e. , no-fault insurance), the general public tended to express less satisfaction with liability insurance and tended to favor a no-fault system (Table 27). When first asked whether based on their experience they were or were not satisfied with auto insurance, 65 percent of respondents replied with some degree of satisfaction while 22 percent were dissatisfied. Later, after a brief description of auto liability insurance, the level of dissatisfaction increased; 56 percent indicated satisfaction while 28 percent displayed dissatisfaction. Respondents were then given a brief description of an alternative, no-fault insurance system and were asked for their reaction. The pattern of responses to this question very closely matched that relating to the evaluation of the liability system. In both cases close to 60 percent replied favorably to what had been described. Either respondents changed their opinion upon learning about a no-fault alternative or else they did not see any contradiction in approving two different insurance systems.

The views of seriously injured victims to these same three questions generally paralleled those of the general population, tending to be somewhat more extreme (Table 28). On the question relating to experience with auto insurance, seriously injured victims were clearly less satisfied than the general public, with only 50 percent -- compared to 65 percent -- voicing satisfaction. Almost half (46 percent) of seriously injured victims expressed some dissatisfaction with the present system. One-third of those dissatisfied expressed only moderate dissatisfaction but the other two-thirds answered an unqualified "dissatisfied."

As in the case of the general public, a majority of seriously injured auto accident victims (62 percent) evaluated a brief description of no-fault insurance favorably; and fewer of these respondents were opposed to the no-fault system as described. Once again, respondents either did not see any contradiction in their views on fault and no-fault, or they changed their opinion after becoming aware of an alternative to tort liability.

In the final part of both survey interviews, respondents were given descriptions of two alternative types of automobile insurance (i. e., fault and no-fault) and asked to choose between them.<sup>14</sup> The descriptions were brief, but included the major points of both systems. Because of the desire for brevity and simplicity, the description of fault insurance did not explicitly exclude the first-party coverage which is available within the existing system as a supplement to liability insurance, though it did focus on the third-party liability aspects of insurance. The description of no-fault insurance did not emphasize certainty of payment, an integral part of most such systems that have been proposed.

In response to this choice question, 40 percent of the general public opted for no-fault without qualification, another 15 percent preferred it if the cost were lower and 35 percent favored the present system even if it were more costly (Table 29). Among seriously injured victims, 39 percent chose no-fault without qualification, 9 percent more would choose it if the cost were lower and 39 percent favored the status quo. Accident victims who had recovered under tort understandably showed a greater tendency to favor the fault system than those who had not recovered under tort.

14. A description of the alternative systems can be found in Public Attitudes Supplement, p. 16.

COMPARISON OF EXPRESSED CHOICE BETWEEN  
FAULT AND NO-FAULT INSURANCE FOR THE  
GENERAL PUBLIC AND SERIOUSLY INJURED VICTIMS

Choice Between Systems	General Public	Seriously Injured Victims
Favors no-fault	40%	39%
Favors no-fault only if less costly	15	9
Favors fault even if more costly	35	39
Undecided/not ascertained	10	13
TOTAL	100%	100%

Source: Public Attitudes Supplement, p. 18.

The descriptions of the fault and no-fault systems used in the foregoing "choice" question stressed that the former sometimes paid an additional amount for "pain and suffering" while the latter did not. This matter was addressed in another question which asked if compensation for "pain and suffering" should be eliminated if that would reduce insurance costs. Fifty-three percent of the respondents answered affirmatively, 37 percent negatively and 10 percent gave no opinion.<sup>15</sup>

The expression "pain and suffering" is widely used in insurance circles and elsewhere to connote the entire range of intangible or "general" damages including inconvenience, mental anguish, emotional distress, denial of future happiness or vocational opportunity because of disfigurement, physical impairment, loss of limb, sight or other bodily function, etc. It is more than probable that the majority of the respondents did not have a complete understanding of the full meaning of the term "pain and suffering," in particular the fact that it encompasses the more serious kinds of intangible loss. This

15. Public Attitudes, p. 66.

likelihood, however, by no means undermines the usefulness of the responses to the survey's questions. Most accident liability claims involving personal injury do not involve serious kinds of intangible loss. For example, a survey of paid personal injury liability claims showed that only 7.6 percent involved permanent disability, permanent disfigurement or death.<sup>16</sup> Moreover, it would appear that liability insurance payments to such victims, on the average, do not even approach their economic losses. Average total economic loss (including lost future earnings) for fatally injured victims was estimated at \$22,894; liability insurance payments averaged \$10,981. Average total economic loss for permanently and totally disabled victims was \$78,000; liability insurance payment averaged \$12,556.<sup>17</sup>

Indeed, it is clear that most of "pain and suffering" dollars are going to victims with relatively minor, transient injuries who experience their "pain and suffering" in the literal dictionary sense of the term. That a majority of the public would be willing to forego compensation for these hard to measure intangible losses is important.

A provocative point to consider is that the overwhelming majority of respondents to the attitudinal survey of the general public who were involved in multi-car accidents believed that the "other driver" was at fault (Table 30). Since fault obviously has been attributed wrongly to the "other driver" in some unknown but large number of cases, it would have been interesting to learn whether the respondents to both surveys who favorably evaluated the fault system and expressed preference for liability insurance over no-fault insurance still would hold these opinions if the actual "guilty" party were known.

Source: Public Attitudes, p. 119.

In evaluating these responses, it should be recognized that any question asked of a large group of people concerning their satisfaction with an existing institution is likely to carry a built-in bias in favor of that institution. While there may often be a number of complainers or fault-finders, there will also be a sizeable percentage of people who accept the status quo as they have had no negative experience to make them question it. Many of these people have given no thought to their auto insurance; they pay their premiums when they are billed, and are grateful for the feeling of being protected. It is not surprising, therefore, that when asked whether they were satisfied with their auto insurance two out of three of the general car-owning public said that they were. Understandably, those who had been seriously hurt in an auto accident and who most likely had had recent experience with auto insurance were differently conditioned as a group; only half of them expressed satisfaction.

By the time in the interview when the respondents were asked about their evaluation of and choice between fault and no-fault systems, their understanding of auto insurance had been somewhat clarified and their .

experiences and reactions had been recalled to their minds. Respondents showed a definite interest in preference for a no-fault system.

No survey on an issue as complex as automobile insurance can claim to be perfect in every way. Some may be subject to errors of construction (e. g., simplicity vs. complexity of questions and inadequacy vs. abundance of information provided to respondents); some may be subject to errors of sampling (e. g., the representativeness of the sample to the population); and some may be subject to errors of response (e. g., misinterpretation of questions). Each of these possible sources of error can produce substantially different results to seemingly similar questions. Moreover, small variations in phrasing can lead to different responses. A question written as "Car insurance companies have the duty to provide insurance for all people who need it" will likely evoke a different response than an alternate wording as "Car insurance companies should have the right to refuse to insure some people." Thus, although the responses to several public opinion surveys sponsored by various segments of the insurance industry at times conflict with the results of the Department's two surveys, after carefully reviewing each one, the basic validity of the results of the Department's surveys appears unimpaired.

One of the things that is apparent from all these attitude surveys, from the complaint letters of insurance buyers and claimants, and indeed, from almost any investigation of the consumer and his auto insurance is how imperfectly the consumer comprehends the insurance product and institution. This holds true of the existing system, and would hold true of possible changes or alternatives to it.

Large numbers of consumers appear to be unhappy with auto insurance today, largely with its cost but also with the effects of market constrictions. When insurance

consumers become claimants, especially third-party claimants, the focus of their unhappiness shifts to the conduct of the insurance company. Consumers would appear to be open to change, especially if it would reduce costs. The shift in opinions observed during the two public opinion surveys conducted for the Department of Transportation from general satisfaction with the present automobile liability insurance system to an approval of substantial changes makes it probable that the widespread availability of more information about such alternatives as a no-fault plan will increase the support for a change in the present system.

## **F. Summary of the Findings**

A review of the detailed factual findings of the Study's research and those of other research lead to a number of summary conclusions about the operation of the present system.

### **1. Limited Scope of the Auto Accident Liability Reparations System**

One major shortcoming of the auto accident liability system stems not from the way it performs but rather from its intended scope of operation, i. e. , since only those who can prove that others were at fault while they were without fault in an accident have a legal right to recover their losses. Today, our society need not settle for a reparations system that deliberately excludes large numbers of victims from its protection or that gives clearly inadequate levels of protection to those who need it most. With only 45 percent of those killed or seriously injured in auto accidents benefiting in any way from the tort liability insurance system and one out of every ten of such victims receiving nothing from any system of reparations, the coverage of the present compensation mechanism is seriously deficient.

### **2. Rational Allocation of Compensation Resources**

The present tort liability reparations system allocates benefits very unevenly among the limited number of victims that it purports to serve. The victim with large economic losses, who generally also suffers more severe intangible losses, has a far poorer chance of being fully compensated under the tort system for his economic loss, much less any intangible loss, than does the victim with only minor injuries. As has been seen, only about half of the total compensable economic losses of seriously or fatally injured victims are compensated from any reparations system. For those whose economic losses were more than \$25,000, only about a third

was usually recovered. Those with relatively small economic losses, by contrast, fared much better; if they recovered from tort and had losses less than \$500, their recovery averaged four and a half times actual economic loss. Despite the popular view that large settlements for automobile accident personal injuries are common, they are, in fact, still a statistical rarity when viewed in the context of the entire population and its losses.

### 3. Cost Efficiency of the Auto Accident Liability Reparations System

The automobile accident tort liability insurance system would appear to possess the highly dubious distinction of having probably the highest cost/benefit ratio of any major compensation system currently in operation in this country. As has been shown, for every dollar of net benefits that it provides to victims, it consumes about a dollar. As it presently operates, the system absorbs vast amounts of resources, primarily in performing the functions of marketing insurance policies and settling claims. The measurable costs of these two functions alone approach in general magnitude all net benefits received by auto accident victims through the tort liability system.

Claims settlement, of course, is complicated by the adversary nature of the tort liability system. The possibility of greater efficiency in some areas, such as sales expense, has been thwarted by local laws and regulatory rules that arbitrarily curb the introduction of potentially more economical approaches, such as group auto insurance.

### 4. Timing of Compensation Benefits

The tort liability insurance system tends to deliver benefits without regard to the victim's need, in some cases paying too late and in others too soon. Three different investigations by the Department have

demonstrated that despite commendable efforts by the insurance industry to introduce "advance" or partial payment techniques, the system is still, in the main, quite slow in providing benefit payments. The system pays most slowly in cases where the need for timely payment would appear to be greatest, i. e., in cases of permanent impairment and disfigurement. Moreover, the system can operate to discourage early rehabilitative efforts and places a premium upon their deferment beyond the time when they could be most effective.

### 5. Rehabilitation of Accident Victims

Closely related to the problem of delay in the payment of benefits is that of lost opportunities to minimize very large personal injury losses by the timely use of comprehensive rehabilitation programs for seriously injured accident victims. A disappointingly low utilization of rehabilitation by such victims was revealed in one survey, even when it was recommended to the victim.

Admittedly, rehabilitation under certain other loss-shifting regimes, notably workmen's compensation, has also been disappointing. However, this has been largely due to the overconcentration of these programs on reducing their own costs, i. e., on returning the injured person to work as soon as possible in order that the compensation system be able to reduce benefit payments. While vocational rehabilitation does benefit both the insurer and the victim, truly effective rehabilitation must deal with all of the victim's handicaps, including not only those affecting his work performance, but those affecting his non-work activities as well.

To achieve the maximum potential benefits from the rehabilitation process, the relationship between private insurance benefits and the various rehabilitation agencies, including local, state and national agencies, must be consciously and explicitly coordinated and made to be mutually supportive.

## 6. Property Damage

The Department's study of the auto accident compensation system focused principally on the bodily injured victim. This priority seemed appropriate for several reasons. First, people are more important than property. Second, the most serious accident losses are associated with people, not property. Third, the present compensation system is doing much better today with property losses than it is with people losses. Fourth, the problems of personal injury losses are far more complicated than those of property losses. Fifth, the principal problems afflicting the compensation of property damage losses are either also present in compensating personal injury losses, or are externalities such as vehicle design or repair costs.

Nevertheless, property damage losses are important; they are very large in dollar value and they affect far more people than injury losses. In recent years the cost of repairing vehicles has risen sharply with a consequent rise in the cost of insuring for that repair. Experts, many of them within the insurance industry, have rightly traced part of this rise to the designs of the vehicles themselves. Unfortunately, there is no way for liability insurance to distinguish between damage-resistant vehicles and fragile vehicles, or between very expensive vehicles and those of less value, because the liability insurer cannot know what kind of a vehicle its insured will negligently strike.

Rating systems for collision insurance have only very recently begun to take any consideration of the vehicle's damageability. Now that the vehicle's contribution to crash losses is widely recognized and being increasingly considered by the insurance community, some countervailing pressure on vehicle manufacturers to design more crashworthy and damage-resistant automobiles may be in the offing.

## 7. Strains on Insurance Institutions

The accumulated problems of the tort liability auto insurance system are now making an undeniable impact on the insurance industry itself. Underwriting profits have turned to underwriting losses for many, if not most, companies. Several analyses have indicated that some capital has already been withdrawn from the business of insurance, with a consequent diminution of its ability to offer protection. If such a trend were to persist or accelerate, it would present a social problem of very serious proportions.

Auto insurance today is becoming more and more difficult for many drivers to buy in the voluntary insurance market. Between 1966 and 1969, the number of motorists having to obtain their insurance through assigned risk plans grew from 2.6 million to 3.2 million, or 23 percent.<sup>1</sup> One of the Department's studies estimated that 8 to 10 percent of all drivers were in the "hard-to-place" insurance market in 1968; and recent months have witnessed a further tightening of the auto insurance market, with some major companies either refusing or severely limiting any new business. This development comes at a time when consumers' requirements for automobile insurance protection are increasing if only because of rising medical and auto repair costs.

## 8. Impact on Other Public Institutions

Automobile accident disputes are a major contributory factor to the present problems of the nation's judiciary, even as a multitude of other demands threaten to overburden and, thereby, undermine its effectiveness. Automobile accidents contribute more than 200,000 cases

1. National Association of Independent Insurers, Chart Analysis of Automobile Insurance (Assigned Risk) Plans.

a year to the nation's court load and absorb more than 17 percent of the country's total judicial resources.

The motor vehicle accident tort liability insurance system also has exerted great strains on the existing system of State insurance regulation. It is not coincidental that the burgeoning problem of insurer insolvencies has been concentrated among specialty auto insurers serving the high-risk market. The resulting difficulties created by these insolvencies for consumers, regulators and the insurance institution in general, have proved so resistant to solution that they have led to proposals for a greater centralization of regulatory control, thereby threatening local initiative and freedom in insurance regulation.

#### 9. Highway Safety and Crash Loss Minimization

Highway safety research and technology is demonstrably moving from an art to a science. However, the tort liability system has served, albeit not intentionally, to impede the development of this science in many ways. It discourages openness and frankness and encourages deceit on the part of participants about what happened before, during and after crashes. With the effectiveness of safety programs depending upon a scientifically sound understanding of the causes of highway crashes, insured drivers are now routinely instructed by their insurance companies to speak to no one other than the police, and even then to admit nothing, lest their cases be prejudiced. Injured victims are similarly cautioned by their attorneys to avoid disclosure.

With its single-minded preoccupation with driver error or negligence as the determinant of the compensation decision, the tort liability system ignores all other contributing factors to crash losses, such as the vehicle and the roadway. Cars that are poorly designed to resist damages and to protect occupants from injury can turn what should have been a minor

crash into a large loss or even a serious tragedy. Yet the tort liability insurance premium does not and cannot reflect the value of the car's protective attributes in any way because the third-party's vehicle is unknown until after an accident has occurred.

\* \* \* \* \*

In summary, the existing system ill serves the accident victim, the insuring public and society. It is inefficient, overly costly, incomplete and slow. It allocates benefits poorly, discourages rehabilitation and overburdens the courts and the legal system. Both on the record of its performance and on the logic of its operation, it does little if anything to minimize crash losses.

U.C. BERKELEY LIBRARY

### PART III. ALTERNATIVES TO THE AUTOMOBILE ACCIDENT TORT LIABILITY SYSTEM

The automobile accident reparations system can be viewed as consisting of two main components: the "reparations component," i. e., the basic legal and procedural rules governing reparations and the "insurance component," especially as it relates to, and buttresses, the "reparations component." The latter comprises not simply insurance itself, but also the compulsory insurance and compensation laws, assigned risk plans, mandatory policy provisions, etc. This dichotomy should be kept in mind in viewing the public policy alternatives with regard to the automobile accident reparations system.

Over the years, the reparations system has not lacked for would-be reformers. Its complexity, both in theory and in operation, has permitted great individuality in the framing of reform proposals, whose number has burgeoned, especially in the last decade. They range from minor adjustments to comprehensive programs for fundamental change. Some attempt to achieve improvement through the insurance component, some through the reparations component, and some through both. Some see the problems arising outside the reparations system and seek changes in other institutions or regimes, e. g., court administration, car design, driver licensing and training, traffic law enforcement, etc. A few are patently nostrums; most are serious, well thought out, often imaginative proposals. No attempt will be made here either to summarize or analyze even the major plans now being widely studied.

#### A. Conceptual Considerations and Options

There is, in fact, a vast and largely unmanageable number of combinations possible among the various reform alternatives on such important considerations as: (1) the legal rule governing reparations, (2) the role of

insurance, (3) the kinds of losses to be compensated, (4) private vs. social insurance, (5) compulsory vs. voluntary approaches, and (6) the insurance/loss minimization objective. In order to illustrate the breadth of choice possible, some of the principal alternatives in each of these areas will be briefly described without attempting to examine how all alternatives in one area might interact with all those in another or make judgments about them. Subsequently, the advantages and disadvantages of the major choices for change also will be described.

1. The Legal Rule. The prevailing legal rule regarding automobile accident losses is, of course, that of tort liability under which the innocent victim is legally entitled to recover all of his losses, tangible and intangible, from the wrongdoer if he can prove that the latter was at fault and it is not established that he was himself at fault. While many other advantages are now claimed for this rule (e.g., fairness, vindication, deterrence, etc.), its basic original social purpose (before the advent of insurance) was to shift the burden of loss from the innocent victim to the wrongdoer. Some of the available options are:

- a. Substitute a comparative negligence rule for that of contributory negligence. Under the comparative negligence rule most widely advocated for general adoption, the claimant would be barred from recovery only if his negligence equaled or exceeded that of the defendant; for a lesser degree of negligence, his recovery would be reduced to such extent as it contributed to causing the accident.
- b. Substitute an absolute liability rule by which the driver/owner of any vehicle would be automatically responsible for any damage to others in an accident, regardless of whether he, another driver, or anybody was "at fault" or negligent. Justification

would rest on the assumption that the automobile is an "inherently dangerous" object and driving is an "inherently dangerous" activity. As such, the driver/owner should be absolutely responsible for any damages.

- c. Abolish tort liability in automobile crashes; each driver/owner accepting responsibility for some or all losses sustained by pedestrian occupants of his own vehicle in return for which he would enjoy immunity from suit for those losses.
- d. Replace jury trial judgment of some or all claims with compulsory arbitration.
- e. Adopt a "direct action" statute under which a claimant is permitted to bring action directly against another motorist's liability insurer.

2. The Role of Insurance. Today, there are essentially four types of insurance serving the automobile industry; two are oriented specifically to the automobile and two are general insurances.

Under most State financial responsibility laws, automobile liability insurance is virtually compulsory in practice if not in theory. From the policyholder's perspective, auto liability insurance is designed to protect his assets in the event he is found at fault in an accident. From the public's perspective, compulsory liability insurance is intended to assure that the innocent victim will have a source from which to recover damages; thus, it would not become a burden on the State to pay his uncompensated losses.

Uninsured motorist insurance is a related form of coverage, generally required to be provided or added to the purchaser of liability insurance to protect against "guilty" third parties who are uninsured or not insured by an insurer that subsequently becomes insolvent.

The first-party automobile insurance coverages -- medical payments, comprehensive, and collision -- are essentially voluntary. Collision and comprehensive insurance, however, are usually required when the purchase of a car is financed.

General private insurance -- life, accident and health, disability income, etc. -- provides an important source of compensation for the auto accident victim, albeit sometimes redundantly where there is also a tort recovery.

Social insurance -- social security disability, Medicaid, veterans' benefits, etc. -- are also important sources of recovery for the accident victim, but they too contribute to the problem of duplicative recovery.

Besides the coordination of benefits problems created by this plethora of possible recovery sources, there is the question of the desirability of "internalizing" auto accident costs, i. e., "making motoring pay its own way" rather than shifting the burden of accident losses to general or social insurance programs. In addition, there is the question of limits and deductibles, i. e., whether a private, competitive insurance system should attempt to deal with small losses, or whether it is well-equipped to deal on a large scale with catastrophic losses to individuals.

Some of the options in this area are:

- a. Abolish the collateral source rule under the fault system in order to preclude the plaintiff from claiming damages with respect to expenses recovered from other sources, or, alternatively, allow the defendant to show that the plaintiff has recovered such expenses from other sources.
- b. Make all auto insurance first-party insurance that is primary (or alternatively, excess) to all other

insurance coverage or primary (or excess) to benefits provided by other compensation systems.

- c. Make first-party auto insurance mandatory with respect to bodily injury loss (hospital/medical expense, disability income) but voluntary with respect to property damage, collision, etc. Preclude by statute or rule recovery under tort for any losses mandatorily covered by first-party auto insurance.
- d. Provide for reasonable deductibles under a first-party system to avoid the excessive transaction costs of handling small claims.
- e. Make recovery unlimited under compulsory coverages, at least for tangible economic losses.
- f. Permit insurers to limit their liability, subject to minimum statutory limits of liability.

3. Kinds of Losses to be Compensated. Under tort liability rules, intangible as well as tangible (i. e., economic) losses are legally recoverable. Liability insurance tries to respond to this goal, at least in theory, subject to the limits of liability contained in the policy or required by the applicable statute. As previously noted, intangible losses include those losses not susceptible to objective measurement in dollars, e. g., pain and suffering (the "ouch"), mental or emotional disturbance, bereavement over the loss of a loved one, inconvenience, annoyance, and loss of vocational or social opportunity incident to loss of limb, sight or function or because of disfigurement. Because there is no objective way to put a price on these losses, the price is established under the tort system either through bargaining or, where agreement is impossible, through decision by a jury.

A first-party insurance system that eliminated or limited the right to recovery for pain and suffering and

similar intangible losses might reduce the expense part of the insurance dollar by eliminating the bargaining or litigation inherent in attempting to evaluate intangible damages and by eliminating the other transaction costs involved.

Additionally, under a first-party system, the insurance consumer would enjoy the contractual right to recover benefits from the insurer whom he has chosen and to whom he has paid his premium. In contrast, under the present system, the injured party has no rights whatsoever against the wrongdoer's insurer unless he obtains a judgment against the wrongdoer.

There is also the question of whose losses a specialized auto insurance system should compensate. The innocent victim falling within the tort liability system has the right, in theory if not in practice, to recover all his losses. Victims of many other kinds of accidents can recover only certain types of losses (e. g., they cannot recover their intangible losses), and then only if they have voluntarily chosen and been able to insure themselves in advance. This is true no matter what their need, no matter how slight or unintentional their negligence. Moreover, the main impact of a wrongdoer's negligence can and often does fall uncompensated on wholly innocent parties, e. g., on the survivors of a fatally injured but negligent driver. Should the compensation system, especially one supported by the premium payments of all drivers, make this harsh distinction between victims whose relative contributions to the cause of the accident may be slight, if perhaps indistinguishable?

Major options in this area are:

- a. Abolish any legal right to compensation for intangible damages in auto accident cases.

- b. Abolish the right to be compensated for pain and suffering, inconvenience, discomfort, grief, emotional loss of a loved one, etc., but retain the right to recovery for loss of sight, limb, major function, permanent serious disfigurement or impairment, etc.
- c. Establish a schedule of damages for specified types of intangible loss, e. g., \$5,000 for loss of limb or \$10,000 for loss of sight.
- d. Permit intangible damage insurance to be sold on a voluntary basis, if insurers can work out satisfactory methods and procedures.
- e. Permit all victims except those who intentionally injure themselves, or are grossly negligent, etc., to have equal rights to compensation according to their needs.
- f. Replace contributory negligence with a comparative negligence rule.

4. Private vs. Social Insurance. The automobile insurance and compensation system today is a private institution, subject, however, to regulation in the public interest. It is regulated not only by insurance and motor vehicle regulatory authorities, but also by the courts which interpret statutes and review legal doctrines in the light of a public policy favoring compensation of innocent accident victims. Although financial responsibility and compulsory insurance laws have made the possession of liability insurance virtually obligatory, the choice of one's insurer and the amount of one's protection (above minimum limits) is still largely a voluntary matter for the majority of good drivers. Some commentators have suggested that the problems of our private auto accident compensation system are so great and apparently so resistant to solution, and that the public's interest in their solution is also so great, that only a governmentally

managed insurance approach promises a truly fair, efficient and comprehensive system. Financing for a social insurance auto accident compensation mechanism could be achieved through general tax revenues, taxes on motor vehicles or fuel, or scheduled fees for drivers/owners.

A key facet of this issue concerns the "residual" auto insurance market for those motorists who are unable to obtain liability insurance in the voluntary market and are forced to obtain it from assigned risk plans or high-risk insurers at significantly higher rates. Such difficulty in obtaining coverage and the high cost of buying it in the "residual" market usually falls heaviest on those already economically and socially disadvantaged. Regardless of what form auto insurance takes (i.e., fault or no-fault, first-party or third-party), as long as insurers are free to reject marginal applicants, some motorists will be unable to buy coverage in the voluntary market.

Some of the principal alternatives in this area are:

- a. Shift the compensation of some auto accident losses (costs) -- e.g., medical, rehabilitation, income maintenance, but not property or intangible losses -- or all auto accident losses to a governmentally directed social insurance approach, perhaps employing private carriers on a fee basis to service the system (a la Medicare).
- b. Have the government become an "insurer of last resort," either itself insuring such residual risks at rates less than the actuarial rates or subsidizing such risks by paying or guaranteeing private insurers the difference between the actuarial rates and the fully compensatory rates.
- c. Require private insurers to accept all applicants, perhaps with the aid of some reinsurance institution such as that used in Canada.

- d. Replace the private automobile insurance system with a governmentally owned and operated automobile insurance mechanism, the funds of which would be raised through the contributions of drivers and owners.

5. Compulsory vs. Voluntary Approaches. State statutes have rendered minimum limits of auto liability insurance virtually compulsory for the average driver. However, the absence of any compulsion to insure one's own losses and the relatively low minimum liability insurance limits have left very large amounts of loss uncovered by auto insurance, or indeed by any type of insurance. Moreover, even with financial responsibility laws, substantial numbers of motorists are not insured for liability while many others are without effective coverage for particular accidents because of coverage gaps or breaches of policy provisions by the insured.

The major alternatives here are:

- a. Establish a nationwide, universal, compulsory insurance system based on tort liability, requiring high limits and making the insurer's liability absolute so that the victim's claim cannot be defeated because of policy defenses.
- b. Establish a nationwide, universal, compulsory insurance system based on a first-party concept, requiring high limits but maximizing the area of voluntary choice through the introduction of deductibles applicable to the named insured and those within his control (e.g., members of the household) and, perhaps, to others (e.g., uninsured guest passengers or pedestrians).
- c. Maximize the area of voluntary choice with respect to all insurance coverage (most logically by making everyone responsible for his own losses).

6. Insurance and the Loss Minimization Objective. If the first link in any accident causation chain is driver error or negligence, modern accident theory has increasingly pointed to the vehicle as being the principal determinant of whether or not there will be loss and if so what its nature and severity will be. Liability law and auto insurance rating schemes focus almost entirely on the driver, his behavior, his driving exposure, his potential as a defendant in a liability suit and the estimated likelihood of his accident involvement. The ability of the vehicle to protect either itself or its occupants in a collision is not, indeed cannot be, included in liability insurance rating plans because the insurer cannot know who the victim will be or in what kind of vehicle he may be riding.

By contrast, in a first-party system not only would an insurer know in advance what kind of owner/driver it was insuring, but, in addition, it would know what kind of car the insured was driving or occupying, what protective or safety devices it incorporated, whether it was overpowered for its size and weight, whether it was overly or needlessly susceptible to major damage from minor impact, etc.

The deterrent effect of legal liability for negligent driving as a loss minimizing measure is often advanced as an attribute of the tort liability rule (i. e. , since the rule holds that a person is responsible for damage directly resulting from his negligence). However, whatever force this threat may once have had, it would seem that insurance has essentially nullified it by allowing drivers to shift the costs of their accidents to the rest of the insuring population. Thus, while the fiction of punishment of the guilty driver remains in the law, the economics of insurance has freed him from its reality. Precisely what effect this fiction of tort liability "punishment" has on the diligence of law enforcement agencies in implementing traffic regulations designed to punish negligent drivers is not clear; but it is clear that the great

majority of accident-involved drivers who might be considered negligent in a tort sense are not fined or punished under our traffic laws. If society does want "guilty" drivers to be "punished," and if the threat of "punishment" is judged to deter negligent driving, then perhaps renewed emphasis should be given to the direct punishment of accident-causing drivers.

Some alternatives in this area would be:

- a. Place auto insurance on a first-party basis and permit or insist that insurers consider the loss prevention capabilities of the vehicles they insure.
- b. Establish national standards for driving conduct and for the imposition of penalties for driving violations (such as fines, mandatory revocation or suspension of license, compulsory rehabilitative treatment for the alcoholic driver, etc.), and let the compensation system do what it can do best, i. e., compensate victims for their losses.

## B. Basic Alternatives

While not reflecting the many nuances and subtleties of the various specific detailed reform plans that have been offered, the range of basic alternatives can be seen in the six described briefly below:

### 1. "Do Nothing Significantly Different"

An obvious option, in fact the one currently being followed, is to do nothing significantly different in connection with either the "reparations component" or the "insurance component" of the automobile accident reparations system. Justification for this approach might rest on such grounds as:

- a. The cost problem of insurance will recede as a public issue as inflationary tendencies abate and as loss costs are controlled by the cumulating effects of safety measures and pressure on car designers.
- b. The insurance availability problem will improve as inflation slows and rate levels become more satisfactory.
- c. The number of people affected by compensation problems is not large even now; and with the growing tendency of drivers to buy high limits of liability insurance and the growing availability of benefits for all victims from non-auto insurance sources, it will become even less of a problem in the future.
- d. The tort liability rule should not be disturbed for any but the most compelling reason, and the present problems of auto insurance do not constitute such a reason.

Advantages of the "Do Nothing" Option. This option, at least superficially, is not without some appealing advantages. For example,

- a. It is easy.
- b. It would involve no precipitate economic dislocations or shifts in competitive advantage for the business participants in the system.
- c. In the near term, its results are fairly predictable.
- d. No new governmental initiatives would be required.

Disadvantages of the "Do Nothing" Option. The disadvantages of this option are both numerous and obvious. The principal ones are:

- a. It ignores a serious public problem for which experience gives little hope of a spontaneous cure.
- b. It is difficult to reconcile with the demonstrated and growing intent of the consumer and his legislators for some kind of change.
- c. It risks the development of a crisis such that nothing short of a government takeover of the compensation responsibility would solve.
- d. It does nothing about insurance costs.

## 2. "Improve the Present Reparations System"

This alternative, which reflects the American Bar Association's concession that the automobile insurance and compensation system needs reform, is premised on the assumption that reform can, and should, stop short of abandonment of the tort system or other "hallowed" legal tenets such as the collateral source doctrine. (The Defense Research Institute, a research organization of insurance company lawyers, advocates that the defendant be permitted to lay before the jury the

fact and amount of the plaintiff's compensation from other sources.)

The principal features of this plan may be considered under the headings: (a) judicial reform, (b) substantive-law reform, (c) insurance reform, (d) automobile insurance costs and (e) legal services.

Judicial Reform. This plan argues that the hardship and injustice resulting from court delays can be eliminated through streamlining and improving the judicial process, e. g., by providing for unified court systems with presiding judges empowered to assign other judges to best advantage. Also recommended is the provision of administrative officers to assist the court in scheduling trials and maintaining the flow of cases. Improvements in judge selection and tenure and in pre-trial and trial procedures are seen as ameliorating trial delay. While rejecting mandatory arbitration, voluntary waiver of jury trial and the provision of panels of judges who attract jury-waived cases would be cautiously encouraged. Efforts toward voluntary arbitration of small claims would be cautiously encouraged. Advance payments would be facilitated by statutes negating any inference of liability on account of such payment. Primary emphasis, however, is placed on increasing the number of judges, with provision made to maintain an appropriate ratio by automatically adding judges as population increases.

Substantive-law Reform. The plan, while recognizing that comparative negligence will result in more recoveries both by way of judgments and by way of settlements, recommends a Wisconsin-type comparative negligence rule. Immunities such as governments' sovereign immunity, the inter-spousal and intra-familial immunities and the immunity of charitable organizations would be eliminated. Guest passenger statutes, however, would be retained because "[t]heir repeal would have a marked upward (and apparently unacceptable) effect on insurance

costs in the states having them."<sup>1</sup> Statutory limitation on recovery in wrongful death cases, where mere pecuniary loss, would be removed. In those states where the sole measure of recovery in such cases is punitive damages, statutory limits would be removed.

Insurance Reform. There would be universal compulsory automobile liability insurance with mandatory uninsured motorist coverage, including insolvency protection. There would be no compulsory provision of non-fault benefits on a first-party basis since this is viewed as containing the seeds of the destructive adversary system. However, study should be made of a plan for payment of medical expenses under a "no pay, cross-over" scheme through which the at-fault victim, including the pedestrian, would receive medical expenses, regardless of fault, under the no payments coverage of the other party, i. e., on a first-party basis. This provision of limited mandatory benefits on a strict liability basis would not entail abolition of the adversary system.

Automobile Insurance Costs. Principal responsibility for any cost reduction would be placed on the automobile insurance industry to find better and less costly ways of providing and distributing the current insurance services and on more speedy and efficient ways of delivering insurance services.

Legal Services. The contingent fee system would be retained, but with the courts assuming responsibility for the examination, scheduling and supervision of attorneys' fees and for the discipline of attorneys who violated established rules or act unprofessionally. The courts would require the filing of information on contingent fee arrangements as well as the filing of closing statements and they would be empowered to promulgate contingent fee schedules when appropriate. Courts would

---

1. ABA Report, p. 87.

provide for the filing and disposition of clients' complaints against attorneys.

Advantages of the "Improve the Present Reparations System" Option

- a. It would bring reparations to some victims not now compensated, e. g., those barred by contributory negligence or immunity doctrines.
- b. Compulsory, universal insurance would prevent uninsured motorists from being able to benefit from the system while not contributing to it.
- c. Delay occasioned by court congestion would be mitigated.

Disadvantages of the "Improve the Present Reparations System" Option

- a. It retains most of the costs inherent in any adversary system.
- b. It does not come to grips with the needs of the "guilty" victim and his dependents or survivors.
- c. It is more likely to increase costs than decrease them.
- d. A more efficient judicial administration may increase the litigation burden rather than decrease it since more cases can be litigated, albeit faster.

3. "Evolutionary Reform, Type I"

Type I Evolutionary Reform would require a compulsory, first-party medical and income benefit coverage as a floor for compensable damages for all motor vehicle accident victims. Any amounts received under this

coverage would be subtracted from any additional recovery a victim might be entitled to under tort.

This type of proposal frequently is coupled with other measures to improve the provision of compensation under tort liability rules. The comparative negligence concept would be adopted, providing for recovery under tort based on the degree of fault rather than requiring the absolute absence of fault as under contributory negligence. It would also allow insurance companies to deduct the claimants' income tax savings in the determination of recoverable damages. The plan also anticipates the adoption of measures to promote the use of advance liability payments in meritorious cases.

Several features are designed to improve the cost effectiveness of the present system. These include mandatory arbitration of small claims under \$3,000 so as to reduce the amount of legal and judicial effort and expense needed for the vast majority of small cases. Standards for measuring pain and suffering damages would be established. For example, one proposal contemplates paying for pain and suffering an amount equal to 50 percent of medical and income loss below \$500 and 100 percent above \$500. Additional amounts would be allowed in cases involving permanent disfigurement, impairment or death. Attorney fees would be regulated by law subject to modification by the courts. Stiff penalties would be provided for fraudulent claims.

#### Advantages of "Type 1 Evolutionary Reform"

- a. It enables most accident victims to obtain timely compensation for their personal injuries as a matter of contract, while still leaving the tort remedy essentially unimpaired.
- b. Controls on pain and suffering payments and contingent fees, and compulsory arbitration should

provide some cost savings and help reduce court congestion.

- c. It would provide a modest compromise with the total no-fault principle, and as such, might be considered by those who wish to so view it as an evolutionary step toward a more comprehensive no-fault system. (Some versions of the plan would allow the first-party insurer to subrogate against the other party's insurer for any first-party benefits paid. Such a system would not, of course, be a step in the direction of no-fault insurance.)
- d. It would increase the cost efficiency of the system, at least modestly.

#### Disadvantages of "Type I Evolutionary Reform"

- a. The assurance of first-party recovery might add to the tendency to litigate or hold out for larger tort settlements.
- b. The low level of assured first-party benefits does not effectively treat the problem of the seriously injured victim, and there is no incentive to better rehabilitation.
- c. Since it deals only with personal injury benefits, there would be no pressures on car designers through insurance rates to design less fragile cars.
- d. While some costs would be purged from the system, it is unlikely that the savings would be sufficient to offset the increased costs of the additional benefits.
- e. If the first-party carrier is allowed to subrogate on the basis of fault, the system will continue to incur the transaction costs of shifting the loss.

#### 4. "Evolutionary Reform, Type II"

This proposal would predicate the basic desirability of the no-fault concept of auto accident compensation but would attempt to recognize and cope with the problems of practical implementation and public acceptance involved in a shift to a largely first-party reparations system. The principal insurance and compensation aspect of this option would be:

- a. First-party automobile accident insurance covering all economic loss (medical, income, etc.) up to high levels would be compulsory, with coverage extended to the vehicle owner and all members of his household, to any person operating, occupying or using a motor vehicle with his permission and to any uninsured pedestrian struck by a motor vehicle. This insurance would cover economic loss resulting from accidental bodily injury, sickness or disease, including death, or damage to such motor vehicle sustained while in or upon, entering or alighting from a motor vehicle, or as a result of being struck, as a pedestrian, by the motor vehicle and arising out of the ownership, operation, maintenance or use of such motor vehicle.
- b. A mandatory deductible would be imposed for the purpose of avoiding the inordinate expense of handling small losses; a choice of deductibles for the various coverages would be available to the insured at appropriate rates. In addition, several options could be made available to the insured with respect to the ceiling on recoverable wage loss. Rates appropriate to the ceiling selected (and hence to the insured's ability to pay) would apply.
- c. Such coverage would apply only as excess over any other insurance or benefits available under any

other insurance policy or benefit plan. The deductible and the concomitant rate selected by the insured would ordinarily reflect the extent to which he anticipates other coverage or benefits available to him to respond to any loss sustained by him or members of his household. (An alternative, which would recognize the fact that auto accidents frequently involve many kinds of loss, and that consequently it may be more efficient to deal with one benefit source than several, would be to make this coverage primary and let other systems bear the burden of coordinating their benefits with auto insurance. In this case, savings from the elimination of duplicate benefits would be achieved in the non-auto insurance coverages.)

- d. Every owner, operator, person or organization responsible for the operation or use of an automobile insured for the first-party coverage would be immune from tort liability for the types of damages covered in the mandatory first-party insurance. Tort recovery for intangible damages would be limited to serious cases only, if at all.
- e. Rate structures and rating plans would be expected or required to give consideration to the safety devices and damage-resistant features of the insured vehicle.
- f. Incentives for rehabilitation would be provided, and the tort fines contemplated by the plan could be allocated to such purpose or to highway safety programs.
- g. The system would be implemented in stages, on a single nationwide schedule. There would be an opportunity to review and assess the performance of the new system before proceeding to the next stage.

### Advantages of "Type II Evolutionary Reform"

- a. Ultimately, depending on the implementation schedule, this plan should sharply reduce litigation and accident-related court congestion.
- b. The plan, at least on its logic, should permit the achievement of substantial economies in the delivery of benefits.
- c. It would assure a much higher level of benefits to all victims.
- d. With the assured availability of higher personal injury benefits, insurance could be made to support rehabilitation programs more effectively.
- e. Insurance rates could be made to reflect the loss-causing potential of poor car design.
- f. Gradual implementation would give time for institutions to adjust and for the plan to be tested and improved.

### Disadvantages of "Type II Evolutionary Reform"

- a. The cost savings, diminution of court burden, higher compensation levels, etc., would be postponed to the extent full implementation was delayed.
- b. While a convincing case can be made that compensation for personal injury should not have to run the gauntlet of an adversary determination, the same is more difficult to make with respect to property damage to the car. This is especially true of the "parking lot" accident or "fender-bender" where who "caused" the accident is manifestly clear and yet the "innocent" car owner might have to absorb a rather high deductible.

- c. During the transition to the no-fault system, there will be some overlapping between first-party and third-party systems that may produce dis-economies of an unknown nature.
- d. Even though they may be in a minority, some of the public may find no-fault arrangements unacceptable.
- e. The absolute costs of the system are unknowable (Medicare will be cited), and it will be argued that these costs will create a degree of disenchantment that can lead only to social insurance.

#### 5. "Total No-Fault"

This total no-fault option reflects the proposal of the American Insurance Association (AIA) which concluded that the deficiencies of the present system are traceable to the fault method of determining eligibility for reparations and to the rule of damages which permits recovery for intangible losses without providing an objective standard for measurement. As proposed, it held forth the prospect of a premium saving from adequate rate levels of up to 45 percent on compulsory coverages. The principal provisions include:

- a. Compulsory first-party insurance covering all economic loss without limit (except wage loss over \$750 per month) for the vehicle owner, his family, vehicle occupants not otherwise covered and pedestrians. This insurance would be primary for the owner and his family and provide coverage in any motor vehicle accident except public vehicles, in which case that vehicle's insurance would be primary.
- b. Complete immunity from any tort liability arising from a motor vehicle accident.

- c. A tax offset of 15 percent applicable to income reimbursement, subject to proof of a lower value.
- d. Exclusion of payment for pain and suffering, but the inclusion of additional payment for permanent impairment or disfigurement not to exceed 50 percent of hospital and medical expenses.
- e. Requiring automobile insurance to be primary (no deductions are made for duplicate payments made by health insurance, sick leave, etc.) on the theory that the motoring public should bear the cost of motor vehicle accidents and that over time collateral benefit systems will exclude motor vehicle accidents. (The New York proposal of Governor Rockefeller would retain the basic features of the AIA plan except that it would make the compulsory no-fault coverage excess to all other benefit sources.)
- f. Economic loss benefits payable as losses accrue, thereby permitting timely payments not possible for most victims under the prevailing lump-sum settlement system.
- g. Residual liability coverage covering the motorist in any State or jurisdiction where tort law continues to apply.
- h. An "Assigned Claims" plan to handle any cases not covered by the compulsory insurance.
- i. Exclusion of benefits for damage to one's own vehicle unless collision coverage is voluntarily purchased. All motorists would have to purchase property damage coverage to pay for any damage they cause to someone else's property other than motor vehicles.

- j. Exclusion of benefits for anyone who intentionally inflicts injury upon himself through the use of an automobile.

#### Advantages of a "Total No-Fault" System

- a. System costs, court burden and delays in payment should be minimized.
- b. Benefits should more closely parallel the economic needs of the victim.
- c. Rehabilitation could be encouraged.
- d. Maximum incentives would be placed on designers to develop safe and durable cars.
- e. Premiums would accord better with ability to pay.
- f. Insurers would be better able to assess the loss potential of prospective insureds.

#### Disadvantages of a "Total No-Fault" System

- a. Depending on benefit levels, total costs might rise.
- b. Intangible losses that now are compensated would go uncompensated.
- c. Such a drastic change comprises many uncertainties and unknowns.
- d. The respective competitive advantages of individual companies might change sharply and in unpredictable ways.
- e. The change would effectively eliminate any major role for the auto accident negligence bar, and if reform did not work, that capability might be difficult to reconstitute.

- f. If no-fault proved unacceptable in practice for whatever reason, the structure of the tort liability insurance system might prove incapable of reconstitution, with the only option being that of a social insurance scheme run by the government.
- g. However slight, whatever value the fault system has as a deterrent to deviant driving behavior would be lost.

#### 6. "Government Insurance"

Government-run reparations systems are now operating in Canada and Puerto Rico. This particular version is designed to provide an automatic accident compensation scheme that would guarantee a reasonable minimum of compensation for losses arising from motor vehicle accidents regardless of fault.

The plan would encompass not only personal injury (non-fault) benefits but also first-party automobile physical damage coverage and third-party liability and uninsured motorist coverage with combined limits of liability of \$35,000. In short, the plan does not erase the fault system, although any tort recovery is diminished by the non-fault benefits previously received.

Insurance would be compulsory. A premium charge would be assessed with respect to the vehicle itself and another premium charge against each driver at the time of his licensing and varying with his traffic record. The system, therefore, lends not only to the equitable implementation of a safe-driver, merit rating plan, but also allows the driver to be insured rather than just the car. The registration certificate and the operator's license would constitute the insurance policy.

The compulsory insurance would be a government monopoly, but supplemental coverages could be provided by private insurers as well as by the government. The

compulsory, non-fault coverage would encompass:

(1) personal injury, including compensation for impairment of bodily function, weekly indemnity and a discretionary supplemental allowance for out-of-pocket expenses not otherwise reimbursed; (2) death benefits; and (3) comprehensive motor vehicle physical damage coverage, including collision. All except the death benefit would be subject to a deductible.

Under the personal injury benefits, weekly indemnity at a specified rate per week would be provided during the period of total or partial temporary disability up to a maximum of two years. Provisions would be made for payment for disability remaining after treatment measured by the degree of disability of the injured part in relation to the body as a whole. Loss of sight or hearing and disfigurement would also be covered. There would be a maximum amount payable under the disability schedule. Where death results, death benefits up to \$10,000 would be payable.

#### Advantages of "Government Insurance"

- a. There would be no "residual market" problem for "high-risk" drivers since the government monopoly would spread loss costs across the entire driving population.
- b. Responsibility for driver licensing, traffic law enforcement, safety standards, etc., would rest with the same institutions responsible for dealing with motor vehicle accident loss costs.
- c. Marketing costs would be reduced.
- d. Standards of compensation would be more responsive to legislative intent.

**Disadvantages of "Government Insurance"**

- a. Government insurance would require the creation of a government insurance institution of formidable proportions.
- b. Experimentation and adaptation to local needs and desires would become more difficult.
- c. Costs would probably rise (viz., Medicare) and benefits would be circumscribed.
- d. Government insurance would lose the incentives to economy and efficiency that, in theory at least, are now provided by the private, competitive market.

## PART IV. RECOMMENDATIONS FOR CHANGE

### A. Toward a Better Compensation System

Weighing all the advantages and disadvantages of the various choices available, the main outlines or principles of a better compensation system can be identified: a system that would be more efficient, offer greater flexibility and personal choice, be fairer, give greater incentives to loss reduction and do a better job, overall, of repairing victims' losses.

#### 1. Basic Reliance on First-Party Insurance

One of the important unmet needs apparent in the experience of the existing tort liability system is for a continuing, mutually confident and cooperative relationship between the insured and his insurer. Unlike the present system where the innocent victim must deal in an adversary relationship with a strange company, a "compensation" system in which the insured evaluates and chooses his own benefit source in advance of his loss would appear to offer many advantages. It would seem to be far more effective and satisfactory if the person injured in an accident could look to his own insurer for compensation just as is now true of homeowners or health and accident insurance where benefits are forthcoming as a matter of contract rather than of fault-finding and bargaining or suit. Such a "first-party" arrangement automatically places a greater importance on the quality of service to the victim, encouraging insurance companies to compete on this basis. Victims dealing with their own insurer would be less inclined to jeopardize that relationship by way of exaggerated or fraudulent claims than they are today when dealing with "somebody else's" company.

A basically first-party system would also enable the insurer to evaluate its risk in the broadest and fairest context, since it will know who it may have to

compensate, the value and protective attributes of the vehicle they will be occupying, their driving habits, exposure and record, and their probable economic needs in the event of an accident. Unsafe, overpowered or delicately designed vehicles could begin to reflect their true costs in terms of their potential for causing and sustaining accident losses.

## 2. Availability of Benefits to All Accident Victims

A socially responsible auto accident reparations system should guarantee basic benefits to all accident victims, except, of course, those who willfully injure themselves or others. It should cover the economic losses associated with medical expenses, income loss, funeral expenses, required replacement services and property losses, at levels designed to prevent or effectively mitigate any serious economic dislocation for the individual victim or his dependents in all but the most catastrophic cases. Supplemental benefits should be available on a voluntary basis. At the same time, drivers should be given the choice not to insure themselves against minor losses, but instead to absorb them directly and, thereby, avoid the high administrative costs that the insurance institution incurs when handling minor claims.

## 3. Coordination of Benefits

The respective roles of governmental and the many different private insurance systems should be clearly defined and coordinated. At present, it is possible under some circumstances for a victim to collect compensation for the same loss from several different sources. To the extent that social insurance is available, private insurance sources should be relieved of any obligation to duplicate those benefits. By the same token, benefits paid by automobile insurers under mandatory coverages should not be duplicated by other private insurance systems such as general health and accident insurance.

While not as clear-cut, among reparations sources it can be logically argued that any mandatory auto insurance should be the primary benefit source.

#### 4. Maximum Choice

The individual car owner should be given maximum choice of his insurance source. Individuals should be free to choose between a separate auto insurance policy with the required minimum mandatory coverage and other broad medical-disability plans which meet the standards for that coverage, perhaps through the addition of supplemental benefits, especially for auto accident losses. Thus, for example, one could elect to insure either through his automobile insurer or through his health and accident insurer, providing the latter offered a policy that met the standards for auto accident coverage. In this way, the consumer's insurance coverage options would be maximized.

#### 5. A Privately Operated System

Society should continue to rely upon private enterprise to operate the auto accident compensation system, until and unless it shows itself unwilling or incapable of doing an efficient job. To this end, the compensation system should entail a minimum of compulsion on the consumer for the purchase of private insurance. Individuals should not be compelled to buy more insurance than is necessary to prevent them from becoming a serious problem to themselves, their families or society in the case of an accident. Additional insurance coverage should be made widely available, voluntary and entirely optional on the part of the consumer.

Any different policy would clearly threaten the private nature of the system since compulsion on the citizen to buy will almost certainly lead eventually to pressure upon government to supply the service.

## 6. Maximum Opportunity for Rehabilitation

Although private insurance funding can and should be utilized to pay some of the rehabilitation costs and to sustain the insured's income while participating in prescribed rehabilitation programs (whether designed for vocational or other purposes), the private insurance industry is not well equipped, organized or motivated to provide rehabilitation services directly. The public agencies already in existence afford far greater promise of better future rehabilitation for auto accident victims. Support for these existing agencies should be increased at all levels of government, and consideration should be given to the possibility of requiring private auto insurance carriers to refer victims to rehabilitation routinely when the circumstances of their injuries warrant such referral.

## 7. Minimal Use of Adversary Procedures

Ultimately, most if not all automobile accident loss reparation should take place without the use of adversary procedures. However, in the case of compensation for intangible losses, the fault concept and the adversary system may provide a more acceptable basis than economic losses for making reparations. Even here its use should be limited to truly serious cases, i. e., those involving permanent disfigurement or impairment or, perhaps, those where medical losses exceed a fairly high threshold level.

Good reason argues that there be at least this limitation placed on the right to sue in tort for intangible damages. For example, the threat of suit in minor personal injury cases is widely recognized as the basic reason for the "overpayment" of small claims, frequently at a high multiple of the objectively measurable economic loss involved. The absolute amount of these "overpayments" is very large. On the basis of data drawn from industry claim files, it has been estimated that as much as 34

percent of all bodily injury liability insurance payments were for the intangible losses of non-permanently injured claimants whose measurable economic losses to date of settlement were less than \$5,000. If only claimants with \$2,000 or less in economic loss were counted, the amount of their "overpayments" still constituted almost a third of all payments to all claimants. As noted earlier, more than half the people questioned in the Department's public attitude survey indicated that compensation for pain and suffering should be eliminated if it would reduce insurance costs.

## B. A Specific Recommendation

To explain further the kind of a system that we believe the States should now strive toward, it may be useful to describe what its ultimate configuration might look like following a suitable period of experimentation and testing. It should be emphasized that this is a goal to be achieved over time, not an action blueprint for tomorrow. Moving in stages toward such a goal would allow us to test its virtues and discover its faults, thereby giving us new knowledge that could serve to modify the goal itself. A little observation is worth a great deal of speculation, and State experience with diverse plans will provide us with that opportunity for pilot project testing which must precede massive reform.

This system, as we see it now, should be based on universal, compulsory first-party insurance for all motor vehicle owners covering all economic losses above voluntarily accepted deductibles up to reasonably high limits. Insurers should be free to offer additional insurance coverage above these limits. Victims should retain their present right to sue in tort for specified intangible losses, but the right should be restricted to the truly serious cases. Victims should not be able to sue in tort for economic losses compensated by their own insurers or voluntarily accepted as a deductible. The system should be implemented in stages at the State level. The private insurance industry should service the system, which should continue to be regulated by the several States.

The broad outlines of such a system are proposed below. It should be emphasized that the policy limits and deductibles used in the following description are basically illustrative, although the Department of Transportation's study would indicate that they are roughly in the right order of magnitude.

### 1. Compulsory First-Party Benefits

Under the ultimate configuration of the system, every owner of a motor vehicle should be required to carry

insurance protecting himself, his family and every uninsured passenger or pedestrian suffering injury as a result of an accident involving the insured vehicle for all economic losses they thereby incur for the amounts specified. In addition, the insurance should protect the insured and all members of his family who are part of the same household against losses suffered when they are pedestrians or passengers in some other vehicle.

## 2. Required Medical Benefits

The goal of the ultimate system should be to provide full coverage for all medical benefits with a relatively small permissible deductible per accident but with very high mandatory limit. Any deductible voluntarily assumed by the car owner on behalf of himself and his household or any maximum coverage limit would not apply, however, to the medical losses of uninsured passengers and pedestrians. Included in covered benefits would be all medical rehabilitation expenses within the limits provided. Payment of benefits by a carrier under this coverage should automatically remove the obligation of any other insurance carrier to pay benefits to the extent that the costs are covered by automobile insurance.

## 3. Income Loss Protection

With full implementation of this plan, coverage should be afforded for a relatively high percentage of earned income of the injured or deceased auto accident victim. There should be a short permitted waiting period at the option of the insured for the start of benefits and a permitted monthly benefit ceiling by the insurer of perhaps \$1,000. Voluntarily assumed deductibles or any maximum coverage limit would not apply to pedestrians. Higher benefits for the insured or his family could be made available at the option of the insurer and insured.

This coverage should pay wage continuation benefits whenever an injured person is prevented from working whether as a result of his disability or during his

participation in an approved rehabilitation program. The fact that his rehabilitation program was not necessary for vocational objectives but only to deal with other handicaps should not excuse the payment of wage continuation benefits. The benefit program should provide for modification as provided contractually between the insurer and insured because of changed circumstances, e. g., the remarriage of a surviving spouse, surviving children reaching their majority, etc.

The minimum duration of mandatory income loss protection should, and probably could, be finally established only after some further investigation and experimentation. Initially, minimum duration might be set at three years, except for victims in approved rehabilitation programs whose protection might continue as long as necessary. Longer durations should be optionally available from the beginning and should also be considered for inclusion in the mandatory coverage as experience dictates. A lump sum burial benefit of perhaps \$1,000 per person should be required. Any higher benefits should be optional on the part of the insurer and the insured.

#### 4. Lost Service Benefits

The goal of the system should be to provide coverage for the cost of necessary replacement services for non-employed persons (e. g., housewives) up to a benefit of \$75 per week with a permitted waiting period for benefits at the option of the insured of up to 60 days. Minimum duration of mandatory protection would be the same as for income loss.

#### 5. Property Damage

Ultimately, with the full shift of economic loss compensation to first-party insurance, coverage of damages to property, including the insured vehicle, might be required, but with a permissible deductible referable to the vehicle only at the option of the insured of up to a rather high level, perhaps \$1,000 or a third of the value of the car, and with a

permissible limitation of coverage by the insurer of \$10,000 per accident. There would be no deductible with respect to the non-vehicular property of others damaged in an accident.

#### 6. Elimination of Action for Damages

The goal of the system should be that no recovery for any loss of a type covered by the applicable required coverage would be permitted in any private action for damages. The insured victim's sole recourse for benefits for wage loss, medical loss, lost services, funeral expense and perhaps property damage should be limited to the insured's required coverage and any additional optional coverages that he has elected to purchase, whether under an auto insurance policy or other voluntary loss reparation program.

To the extent that insurance purchasers are willing to pay for duplicate coverages for the same loss and insurers are willing to write duplicate coverage, the practice of cumulating benefits should be allowed. However, unless each policy is clearly stated to be cumulative, only one recovery would be legally permissible with the order of priority among private sources being: (1) auto insurance benefits; and (2) other insurance benefits. In this way, it should be possible to ensure a much better coordination of benefits, with duplicate recovery occurring only where both the insurer and insured had known and agreed about it in advance.

The existing right to sue for damages resulting from negligence in car crashes might be continued for intangible losses, and if so could be subject to one limitation: no person should recover for intangible losses unless he establishes that he suffered permanent impairment or loss of function or permanent disfigurement, or that he incurred personal medical expenses (excluding hospital expenses) as a result of the accident in excess of a rather high dollar threshold. Any dollar threshold initially chosen should

not be considered inviolable but should be reviewed as to its appropriateness at regular, specified intervals.

Drivers should, of course, be permitted to continue to insure against this residual third-party liability.

### C. Cost of Insurance

Almost without exception, every recent probe of consumer attitudes about automobile insurance has shown its cost to lead all other concerns. This is understandable inasmuch as the cost of insurance affects all policyholders, and they are far more numerous than accident victims, while victims are more likely to be affected by their treatment as claimants. An improved system of auto accident compensation such as described above should, once fully implemented, affect the cost of insurance in several ways:

- a. The elimination of "overpayments" of small claims and of compensation of the less serious forms of economic loss should produce cost reduction.
- b. The removal of most compensation decisions from the adversary process should greatly simplify claims adjustment and eliminate much legal and court costs, thereby producing additional substantial cost reduction.
- c. The voluntary acceptance of deductibles by policyholders should produce more savings; the deductibles, themselves, while reducing insurance costs would not be true savings to the insureds, but the concomitant elimination of the insurance mechanism's related administrative costs would be.
- d. The first-party nature of the mandatory insurance coverages should eventually allow insurance companies to rate vehicles as to the value of their protective features and their own damageability. If this encourages the manufacturing of safer vehicles, there would be further insurance cost reduction.

- f. If the first-party nature of the mandatory coverages were to facilitate their marketing on a group basis, and if this produced administrative economies, there might be further savings for those who participate.

Obviously, some features of such a compensation system would work to increase costs:

- a. More victims would participate in benefits and this would increase total costs.
- b. On the average, the more seriously injured victims or the survivors of accident fatalities will receive much greater benefits, and this would also increase total costs. (However, since all drivers would participate in the system, more would be paying premiums, i. e., one analysis of auto insurance coverage in all but six States indicated that about one out of every five drivers was uninsured for auto accident liability.)

It would appear that the true costs of compensating the socially significant losses from motor vehicle accidents should be reduced, since more of the insurance premium dollar would go for needed benefits and less for system expenses. Obviously, the cost to the insurance buyer would depend upon the trends in the frequency and severity of losses, the benefit levels chosen, and his own individual risk potential. To the extent that some potential savings are applied to needed benefits for victims, this too should be counted as a plus. Adequacy and equity of a better compensation system should not yield to cost in our list of priorities.

#### D. Implementation

Without question, any revision of the system along the lines outlined above would entail major changes in existing institutions and practices. The orderly accomplishment of such changes would require further study, cooperation, understanding, planning and the dedicated effort of all concerned, especially of the insuring public.

Mere speculation without observation of the actual operation of a new system is an inadequate basis for immediate and fundamental changes of a national scope in an important area. Experience with diverse plans in the states is essential, and one state has already, this January, taken a step down the road. The states are the best arena in which to solve the problem.

Any new mandatory first-party no-fault coverages could be adopted incrementally, giving both the insuring public and the affected institutions time to gain the necessary understanding and make the necessary adjustments. How much and what kind of compensation should be shifted in any one stage, how many stages there should be or even how long the process should take, or indeed whether it will ultimately prove desirable to go all the way, cannot be answered doctrinarily. Trial will be the best teacher. The important thing is to get started with at least a reasonably agreed-on goal in mind.

One, but by no means the only way to go would be to have the first stage involve the shift of the required medical/hospital loss coverages to a first-party, non-fault basis. Coincident with this step should be the elimination of the right to sue for intangible damages other than those related to death, permanent disfigurement or impairment, or when personal medical losses exceed a given threshold. Before this step is taken, the estimated "cost savings" from the elimination of payments for non-economic losses should be judged at least sufficient to affect any added costs resulting from the higher level of

medical benefits. The public should be able to take this step with some confidence that, overall, insurance costs will not rise because of it.

A suitable period -- hopefully no more than one year or two years -- might then be allowed to elapse during which insurers can gain enough experience with these coverage and recovery rule changes so that insurance rates can be set with confidence before going on to a second phase of the program. This second phase should probably encompass the rest of the personal benefit coverages -- the wage continuation, lost service replacement and funeral benefits. A final phase that would shift all or most of property damage losses to a first-party recovery basis would take place once the system had "digested" the changeover of the personal benefit coverages.

As each phase is entered, damages for the type of loss shifted to mandatory first-party insurance should be removed from consideration in private personal injury litigation, until ultimately only the specified serious intangible losses might still be dealt with in this fashion. Even here if experimentation by insurers with optional, voluntary first-party benefits for these specified types of serious intangible losses were to prove successful, their inclusion under a first-party, no-fault system should also be carefully considered.

Ultimately, the systems of the several states must be compatible. Although there are means available to overcome great diversity, these are cumbersome and a reasonable degree of national uniformity seems best for a number of reasons. Motor vehicle travel is an interstate activity of major proportions and a consistent minimum standard for accident reparations involving all of the motoring public, wherever they travel, would constitute sound public policy. If basic reparations system reform were to be left wholly to individual State initiative without some encouragement, guidance and, at least in an advisory sense, direction from a national perspective, meaningful change might be

exceedingly slow in coming. Should experience with systems of the type we describe prove as successful as we believe it will, the first-party, no-fault concept should become as dominant in the states as the third-party tort system is today. As to the length of the time schedule, a period of perhaps five years seems reasonable, but this judgment can at this juncture be only tentative and certainly should change as future experience dictates. Use of a phased schedule would permit an evolutionary change with ample opportunity for the public policymakers to review and evaluate the performance of the new systems and make any modifications that experience shows are desirable.

### E. The Expected Results

Once implemented, the plan should produce several beneficial results:

A system geared basically to serve the needs of auto victims directly rather than one designed to protect tortfeasors. The latter system obviously was never insurance for the victim; he was no party to the contract. A liability system can easily be defended against the charge that it does not serve all victims. Such a defense only begs the question of the need for insurance for all victims.

A basically first-party insurance system fulfilling the mission of insurance by substituting certainty for uncertainty, both in eligibility for benefits and in amount of benefits payable. As a basically first-party insurance system, the plan lends itself to the prompt, timely payment of benefits for economic loss without the delays associated with the adversary system. Because in most cases benefits would be associated with measurable or ascertainable economic loss, there would be a closer correlation between the loss or damages and the amount of recovery. Thus, the plan avoids having individuals with substantially the same loss reimbursed with substantially different amounts, except to the extent they have voluntarily chosen to be treated differently by employing deductibles or added coverages.

A system much better able to allocate benefit dollars available according to the varying needs of victims. The creation of a proper balance between payments for the less seriously injured cases and the seriously injured would, itself, put benefit dollars to work for a better purpose. The wide spread now existing between settlement amounts and economic loss could be greatly narrowed. The large share of settlements now going to plaintiffs' lawyers would be eliminated.

Claim administration costs would be very sharply curtailed. Because general damages, including lawyers' fees, will no longer be looked upon as a multiple of identifiable losses, a vicious incentive to maximize the latter will no longer exist.

A system lending itself to sounder rating criteria.

As an insurance system, the dollar amount at risk will be better known than under any liability system. What loss a liability insurance policyholder will cause is completely unpredictable because the injured victim is unknown, e. g., a child, a student, a housewife, a retired person, a person earning \$3,000 a year, a person earning \$100,000. To the extent policyholders can be converted from potential wrongdoers to potential beneficiaries in the event of loss, the characteristics of those potentially suffering loss will be ascertainable much more exactly and the consequences of loss more readily determinable.

A system better adapted to the customer's ability to pay. Because the liability system is geared to the potentiality of creating loss to others, premium rates bear most heavily on the youthful and, at least until recently, the aged. Because the potentiality of economic loss to the victim bears a relationship to his economic status, the cost of meeting that potential loss should also be related to his economic status. Moreover, while there is hardly universal agreement, many experts believe that there would also be some narrowing of the wide spread in premium rates that exists today, specifically between adult and youthful drivers and between metropolitan and non-metropolitan areas. A much to be desired corollary is that the public should find the insurance product substantially more available on a voluntary basis than is the current liability product. More applicants should become desirable to insurance companies as insurance risks than is now the case, including some

classes who present special problems today, e. g., the youthful, the elderly and enlisted servicemen.

Greater service orientation of the insurance business.

Unlike the liability system, a basically first-party system would permit the relationship between insurer and insured to be one of mutual respect and trust -- an ingredient essential in an insurance system designed to provide security for the consumer.

A system without incentives to maximize costs.

Any system that determines losses as a multiple of reported actual expenditures provides a well-nigh irresistible incentive to exaggerate, inflate or needlessly build up the actual expenditures, even to the point of providing margins for kickbacks to the providers of service. Such incentives are anti-social as well as the cause for squandering insurance funds and, hence, a source of excessively high insurance premiums. A basically first-party system, properly administered, would not contain such incentives.

A system lending itself to more flexible or efficient merchandising methods. The intensive and extensive degree of underwriting discrimination on an individual basis, the hallmark of the liability system, should lose the justification now ascribed to it. This change in itself would contribute to the effort now underway to exploit various methods of enrolling policyholders in groups that hold some promise of lower acquisition and administrative costs.

Encouragement of competition. Liability insurance companies now insuring about 80 percent of passenger cars and providing medical payments coverage in a substantial majority of cases, will obviously be in the best position in the market to merchandise an expanded first-party coverage. Some of these carriers, now restricting their auto insurance writings because of bad underwriting experience, may be expected to

reverse their competitive posture from one of contraction to one of expansion. Other insurers, intimidated by the bearish industry attitude regarding all forms of liability insurance but experienced with first-party coverages, may be encouraged to enter the field. The overall prospect would, therefore, be one of increased rather than decreased competition. In this connection, relatively small insurers writing first-party coverages have proved viable as they have in the liability field.

Effect on State regulation. If the greater certainty associated with a first-party insurance system led to a freer, larger, more competitive market, regulation of auto insurance rates as now known might safely be relaxed as long as regulatory safeguards against insolvency and unsound rate cutting to destroy competition were maintained. Rather, the energies and talents of State regulatory authorities could be devoted to policing the real substance of insurance administration, i. e., the assurance that the coverages being provided meet established socially responsible standards and that the benefits are being paid in accordance with the policy provisions.

## AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

MONDAY, MAY 3, 1971

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
Washington, D.C.

The committee met, pursuant to notice, at 11:15 a.m. in room 5110, New Senate Office Building, Hon. Warren G. Magnuson (chairman of the committee) presiding.

Present: Senators Magnuson, Hart, Moss, and Cook.

### OPENING STATEMENT BY THE CHAIRMAN

The CHAIRMAN. The committee will come to order.

Today the Senate Commerce Committee resumes hearings on proposals for changing the present automobile compensation system. During the next 10 days the committee will receive testimony from a full spectrum of witnesses on four specific legislative proposals—S. 945, S. 946, S. 976, and Senate Concurrent Resolution 23.

At the beginning of these hearings it might be useful to briefly take stock of where we are in terms of understanding the present automobile compensation system. For many years criticisms have accused our present auto insurance system, of perpetuating human misery and promoting waste. In order to evaluate rationally these accusations, Congress asked a jury of experts to report on auto compensation. The Department of Transportation did make that study, it was of several months' duration, and submitted to us just a few days ago their report.

The basis of that report is of course what we are going to discuss in these hearings. It states, in essence, that American motorists pay \$14 billion annually for auto insurance. And for that \$14 billion they receive about \$7 billion in benefits to pay for about \$11 billion in compensable economic loss.

Many of us feel that if this country is to have a workable compensation system, the benefit dollars are going to have to be increased to cover the losses resulting from auto accidents. And those benefit dollars are going to have to be distributed to auto accident victims on an equitable basis related to the amount of loss each suffers. Only in this way can American motorists be "insured."

But how can we pay for this increase in benefit dollars? We could merely mandate more coverage and collect more money to pay for it. But if we did this we would simply be adding to the already severe economic waste and financial burden of the existing system.

What we must do is make the dollars we are now collecting work better for us. In other words, we must improve the efficiency of the

present benefit delivery system. Of the \$14 billion we pay, we must return in benefits at least up to the amount of their compensable economic loss. Efficiency for an insurance system should easily be attainable.

For example, Blue Cross-Blue Shield, though guilty of many omissions, nevertheless has a 95-percent efficiency. For every dollar it collects, 95 cents is paid out, according to their figures, in benefits. This compares to the present auto insurance system which, according to the best statistics we can find, pays no more than about 50 cents for every dollar collected.

But we cannot be content with merely improving the efficiency of the benefit delivery system. We all have an obligation to reduce the human misery and minimize the economic loss resulting from auto accidents. By building cars safer and stronger we could reduce by several billion dollars the total premium cost to American drivers. Combine these safer and stronger cars with better highway construction, renewed law enforcement efforts, better vehicle inspections, and active antidrinking-driver programs, and an additional cost savings would result.

Our goals, then, in these hearings are to see if we can :

(1) Find an automobile compensation system which compensates all victims of automobile accidents for at least their compensable economic loss;

(2) Find a system of delivering benefits whose efficiency does just this;

(3) Find new ways of reducing losses which result from automobile accidents by: (a) Preventing accidents and, (b) By reducing loss when accidents do occur.

It goes without saying that some other members of my committee and I have some ideas on what we must do to reform our compensation system. But we are going to approach these hearings with an open mind and hope that we will find that which we seek—a new, less costly, more humane automobile compensation system.

(The bills and agency comments follow :)

92<sup>d</sup> CONGRESS  
1<sup>st</sup> Session

# S. 945

## IN THE SENATE OF THE UNITED STATES

FEBRUARY 24 (legislative day, FEBRUARY 17), 1971

Mr. HART (for himself and Mr. MAGNUSON) introduced the following bill;  
which was read twice and referred to the Committee on Commerce

## A BILL

To regulate interstate commerce and to provide for the general welfare by requiring certain insurance as a condition precedent to using the public streets, roads, and highways in order to have an efficient system of motor vehicle insurance which will be uniform among the States, which will guarantee the continued availability of such insurance, and the presentation of meaningful price information, and which will provide sufficient, fair, and prompt payment for rehabilitation and losses due to injury and death arising out of the operation and use of motor vehicles within the channels of interstate commerce, and otherwise affecting such commerce.

- 1 *Be it enacted by the Senate and House of Representa-*
- 2 *tives of the United States of America in Congress assembled,*
- 3 *That this Act may be cited as the "Uniform Motor Vehicle*
- 4 *Insurance Act".*

II

U.C. BERKELEY LIBRARY

## DEFINITIONS

1

2       SEC. 2. As used in this Act—

3       (1) The term “motor vehicle” means any vehicle  
4 driven or drawn by electrical or mechanical power manufac-  
5 tured primarily for use on the public streets, roads, and  
6 highways, except any vehicle operated exclusively on a rail  
7 or rails.

8       (2) (A) The term “insured motor vehicle” means a  
9 motor vehicle insured under a policy of insurance which  
10 meets the requirements of section 5 of this Act.

11       (B) The term “uninsured motor vehicle” means a  
12 motor vehicle with respect to which insurance provided un-  
13 der section 5 of this Act is not applicable at the time of  
14 the accident, or with respect to which the insurer nominally  
15 providing such insurance denies coverage, or is financially  
16 unable to fulfill its obligation.

17       (3) The term “owner” means a person who holds the  
18 legal title to a motor vehicle as defined in subsection (1)  
19 of this section, or in the event a motor vehicle is the subject  
20 of a security agreement or lease with option to purchase  
21 with the debtor or lessee having the right to possession,  
22 then the debtor or lessee shall be deemed the owner for the  
23 purpose of this Act.

24       (4) The term “person” means any individual, partner-

1 ship, corporation, association, trust, syndicate, or other en-  
2 tity.

3 (5) The term "insurer" means any enterprise engaged  
4 in the business of issuing motor vehicle insurance policies.

5 (6) "Operation or use of a motor vehicle" includes  
6 loading or unloading the vehicle, but does not include con-  
7 duct within the course of a business of repairing, serving, or  
8 otherwise maintaining vehicles unless the conduct occurs out-  
9 side the business premises.

10 (7) The term "motor vehicle accident" means a spe-  
11 cifically unexpected occurrence arising out of the operation  
12 or use of a motor vehicle as a motor vehicle.

13 (8) The term "injury" means bodily injury, catas-  
14 trophic harm, sickness, or disease caused by a motor vehicle  
15 accident while in or upon or entering into or alighting from,  
16 or through being struck by, a motor vehicle.

17 (9) The term "catastrophic harm" means permanent  
18 and total disability (including death at any time resulting  
19 from injury) or permanent and partial disability of 70 per  
20 centum or more. The term "catastrophic harm" includes  
21 disfigurement that is permanent, severe, and irreparable.

22 (10) The term "economic loss" means in the case of  
23 injury or death—

24 (A) all appropriate and reasonable expenses nec-

U.C. BERKELEY JOURNAL

1      necessarily incurred for medical, hospital, surgical, profes-  
2      sional nursing, dental, ambulance, and prosthetic serv-  
3      ices;

4            (B) all appropriate and reasonable expenses nec-  
5      essarily incurred for physical and occupational therapy  
6      and rehabilitation;

7            (C) an amount equal to 85 per centum of the  
8      monthly earnings at the time of the injury or \$1,000,  
9      whichever is less, for as long a period as the injury  
10     causes the inability to engage in gainful activity sub-  
11     stantially the same or similar to that engaged in prior  
12     to the injury: *Provided, however,* That in the case of  
13     injury such period shall not exceed thirty months, and  
14     that in the case of death, an amount which shall not  
15     exceed \$30,000;

16           (D) all appropriate and reasonable expenses nec-  
17     essarily incurred as a result of such injury, including,  
18     but not limited to, expenses incurred in obtaining serv-  
19     ices in substitution of those that the injured person would  
20     have performed for the benefit of himself or his family.

21           (11) The term "earnings" means the pay or wages of  
22     an employee before any deductions, and the reasonable value  
23     of the services of a self-employed person before any deduc-  
24     tions.

25           (A) "Monthly earnings at the time of the injury"

1 shall be deemed to be one-twelfth of the average annual  
2 earnings at that time. If earnings are received on a  
3 weekly basis, the weekly equivalent of the monthly  
4 earnings is deemed one-fifty-second of the average annual  
5 earnings.

6 (B) Average annual earnings are determined as  
7 follows:

8 (i) If the person worked in the employment or  
9 self-employment in which he was employed or self-  
10 employed at the time of his injury during substan-  
11 tially the whole year immediately preceding the in-  
12 jury and the employment was in a position, or the  
13 self-employment was of such nature, that an annual  
14 rate of pay—

15 (I) was fixed, the average annual earnings  
16 are the annual rate of pay; or

17 (II) was not fixed, the average annual  
18 earnings are the product obtained by multiply-  
19 ing his daily earnings, or the average thereof if  
20 the daily earnings have fluctuated, by 300 if he  
21 was employed or self-employed on the basis of a  
22 6-day workweek, 280 if employed, or self-em-  
23 ployed on the basis of a  $5\frac{1}{2}$ -day workweek, and  
24 260 if employed or self-employed on a basis of a  
25 5-day workweek.

1           (ii) If the person did not work in the employ-  
2           ment or the self-employment in which he was em-  
3           ployed at the time of his injury substantially the  
4           whole year immediately preceding the injury, but  
5           the employment or self-employment would have af-  
6           forded employment or self-employment for substan-  
7           tially a whole year, the average annual earnings are  
8           a sum equal to the average annual earnings of an  
9           employee or self-employed person of the same class  
10          working substantially the whole immediately preced-  
11          ing year in the same or similar employment or self-  
12          employment in the same or neighboring place as  
13          determined under subsection (11) (B) (i) of this  
14          section.

15          (12) The term "net economic loss" means, in the case of  
16          injury or death "economic loss" reduced (but not below  
17          zero) by the amount of—

18               (A) any benefit or payment received, or entitled to  
19               be received, for losses resulting from such injury or death  
20               under any private or public insurance or plan or other  
21               source of benefits: Except, benefit or payment received,  
22               or entitled to be received—

23                       (i) in discharge of familial obligations of sup-  
24                       port;

25                       (ii) by way of succession at death;

1 (iii) as proceeds of life insurance;  
2 (iv) as gratuities;  
3 (v) as proceeds of any private or public insur-  
4 ance or plan or other source of benefits containing  
5 explicit provisions making its benefits supplemental  
6 to those paid in accordance with the provisions of  
7 section 5 (a) of this Act.

8 (I) If any private or public insurance or  
9 plan or other source of benefits does not provide  
10 that its benefits shall be supplemental to those  
11 under section 5 (a) of this Act, or that the bene-  
12 fits under said section 5 (a) shall be deducted  
13 from its benefits, economic loss shall be reduced  
14 by the amount of any benefit or payment re-  
15 ceived, or entitled to be received, from such pri-  
16 vate or public insurance or plan or other source  
17 of benefits.

18 (13) The term "without regard to fault" means irrespec-  
19 tive of fault as a cause of injury or death, and without appli-  
20 cation of the principle of liability based on negligence.

21 (14) The term "interstate commerce" means trade or  
22 commerce among the several States, or between the Dis-  
23 trict of Columbia or any possession of the United States and  
24 any State or other possession, or within the District of  
25 Columbia.

U. S. BUREAU OF INDIAN AFFAIRS

1       (15) The term "Secretary" means the Secretary of  
2 Transportation.

3       (16) The term "State" means any State or possession of  
4 the United States, the District of Columbia, and the Com-  
5 monwealth of Puerto Rico.

6       CONDITIONS OF OPERATION: REGISTRATION AND FEES

7       SEC. 3. (a) After the effective date of this section, no  
8 person shall register nor knowingly operate or use a motor  
9 vehicle as defined in section 2 (1) of this Act upon the public  
10 streets, roads, and highways of any State at any time unless—

11           (1) Such motor vehicle is insured under a policy of  
12 insurance which meets the requirements of section 5 of  
13 this Act, pursuant to such rules and regulations (includ-  
14 ing those determining the manner and term of proof of  
15 such insurance) as the Secretary shall lawfully prescribe.

16           (A) The requirements of this section may be  
17 satisfied by any person by providing a surety bond,  
18 proof of qualifications as a self-insurer, or other  
19 securities affording security substantially equivalent  
20 to that afforded under section 5 of this Act, as de-  
21 termined and approved by the Secretary.

22           (b) No State shall require the purchase or acquisition  
23 of insurance or any other security as a condition to the oper-  
24 ation or use of any motor vehicle upon the public streets,

1 roads, and highways of such State, other than the insurance  
2 required under section 5 of this Act.

3 (c) The provisions of this section and section 4 of this  
4 Act shall take effect one year and six months after the date  
5 of enactment of this Act.

6 (d) Any person who knowingly violates the provisions  
7 of subsection (a) of this section shall be guilty of a mis-  
8 demeanor and upon conviction thereof, shall be punished  
9 by a fine not to exceed \$1,000 or imprisonment for a period  
10 of not to exceed one year, or both.

11 **TORT EXEMPTION: LIABILITY FOR CATASTROPHIC HARM**

12 **SEC. 4.** No owner, operator, or user of an insured motor  
13 vehicle shall be liable for tort damages of any nature occa-  
14 sioned by bodily injuries arising out of the negligent oper-  
15 ation or use of such vehicle except in cases of catastrophic  
16 harm. In such cases there may be a recovery for economic  
17 loss in excess of that received, or entitled to be received under  
18 this Act, as well as for other elements of damage.

19 **INSURANCE REQUIREMENTS**

20 **SEC. 5.** In order to meet the requirements of section 3

21 (a) and (b) of this Act, an insurance policy shall provide—

22 (a) Net economic loss benefits for injury and death as  
23 follows:

24 (1) Except as otherwise provided in paragraph (3),

U.C. BERKELEY LIBRARY

1 the insurer shall pay, without regard to fault, to any person,  
2 including the owner, operator, or user of an insured motor  
3 vehicle, an amount equal to the net economic loss sustained  
4 by such person for injury as defined in section 2 (7) of this  
5 Act.

6 (2). Except as otherwise provided in paragraph (3), the  
7 insurer shall pay, without regard to fault, to the legal repre-  
8 sentative of any person, including the owner, operator, or  
9 user of an insured motor vehicle, whose death is the result  
10 of injury, for the benefit of the surviving spouse and any  
11 dependent (as defined in section 152 of the Internal Rev-  
12 enue Code of 1954) of such person, an amount equal to  
13 the net economic loss sustained by such spouse and dependent  
14 as a result of the death of such person.

15 (3) No payment shall be made for net economic loss  
16 sustained by—

17 (A) the occupants of another motor vehicle; or

18 (B) the operator or user of a motor vehicle while  
19 committing a felony, or operating or using with the  
20 specific intent of causing injury or damage, or operating  
21 or using a motor vehicle as a converter without a good  
22 faith belief that he is legally entitled to operate or use  
23 such vehicle.

24 (4) Payments for net economic loss shall be made as  
25 such loss is incurred except that in the case of death, pay-

1 ment for such loss shall be made immediately: *Provided*,  
2 That amounts of net economic loss unpaid thirty days after  
3 the insurer has received reasonable proof of the fact and  
4 amount of loss realized, and demand for payment thereof,  
5 shall thereafter bear interest at the rate of 2 per centum per  
6 month.

7 (5) A claim for net economic loss based upon injury  
8 or death to a person who is not an occupant of any motor  
9 vehicle involved in an accident may be made against the  
10 insurer of any involved vehicle: *Provided*, That the insurer  
11 against whom the claim is asserted shall process and pay the  
12 claim as if wholly responsible: *Provided, however*, That such  
13 insurer is thereafter entitled to recover from the insurers of  
14 all other involved vehicles proportionate contribution for  
15 the benefits paid and the costs of processing the claim.

16 (6) Net economic loss sustained by any occupant,  
17 operator, or user of a commercial motor vehicle shall be  
18 paid by the insurer of such commercial motor vehicle.

19 (7) (A) When one or more of the motor vehicles in-  
20 volved in an accident is larger than an ordinary passenger  
21 automobile, the insurer of the larger vehicle shall be respon-  
22 sible for a percentage of any net economic loss paid to occu-  
23 pants involved in the accident.

24 (i) For the purpose of subsection (a) (7) (A) and  
25 (a) (7) (B) of this section, the term "ordinary pas-

1       senger automobile” means any motor vehicle (including  
2       a motorcycle or motorscooter) used primarily for the  
3       transportation of passengers, having a seating capacity  
4       of less than ten passengers, having two or less axles, and  
5       weighing, without cargo or passengers, less than six  
6       thousand pounds.

7       (B) The Secretary shall classify, by rules and regula-  
8       tions under the procedures established in section 4 of the  
9       Administrative Procedure Act, as amended (60 Stat. 237;  
10      5 U.S.C. 553), all motor vehicles larger than ordinary pas-  
11      senger automobiles into reasonable categories, and shall  
12      assign to each category a percentage of responsibility for net  
13      economic loss sustained by occupants of other vehicles:  
14      *Provided*, That such classifications and percentages of re-  
15      sponsibility shall be based upon the increased severity of  
16      injury, caused by large vehicles in comparison to ordinary  
17      passenger automobiles: *Provided further*, That if a larger  
18      vehicle is liable for more than 70 per centum of the net  
19      economic loss, such insurer may control the processing of  
20      any claims for such loss and be entitled to obtain contribu-  
21      tion from insurers liable for the remainder of the benefits.

22       (b) Optional catastrophic harm insurance as follows:

23       (1) At the option of the insured, the insurer shall offer  
24       a provision for legal liability for catastrophic harm arising  
25       out of the negligent operation or use of a motor vehicle, to a

1 limit of, at least \$50,000 for any one person, and \$300,000  
2 for all persons in any one accident; and, at the option of the  
3 insured, the insurer shall offer a provision undertaking to pay  
4 to the insured all sums, not in excess of the limits of liability  
5 provided by the insured's liability insurance, which such in-  
6 sured is legally entitled to recover as damages for cata-  
7 strophic harm arising out of operation or use of any uninsured  
8 motor vehicle.

9 (c) Any such policy of insurance described in this  
10 section may contain—

11 (1) additional coverages and benefits with respect  
12 to any injury, death, property damage, or any other  
13 loss from motor vehicle accidents;

14 (2) terms, conditions, exclusions, and deductible  
15 clauses; consistent with the required provisions of such  
16 policy and approved by the Secretary, who shall only  
17 approve terms, conditions, exclusions, deductible clauses,  
18 coverages, and benefits which are fair and equitable,  
19 and which limit the variety of coverage available so as  
20 to give buyers of insurance reasonable opportunity to  
21 compare the cost of insuring with various insurers.

22 (d) (1) Any application for a policy of insurance which  
23 meets the requirements of subsection (a) of this section  
24 may not be rejected by an insurer, nor shall such policy of  
25 insurance once issued, be canceled or refused renewal, by an

U.C. BERKELEY LIBRARY

1 insurer except for (A) suspension or revocation of the li-  
2 cense of an owner or principal operator to operate a motor  
3 vehicle, or (B) failure to pay the premium for such policy  
4 after reasonable demand therefor: *Provided*, That twenty  
5 days written notice is given to the insured with respect to  
6 paragraphs (A) and (B) of this subsection.

7 (2) An insurer may reject or refuse to accept additional  
8 applications for, or policies of, insurance which meet the  
9 requirements of subsection (a) of this section if the domicil-  
10 iary State supervisory authority of such insurer deems in  
11 writing that the solvency of such insurer would be impaired  
12 by the writing of additional policies of such insurance.

13 (3) Whoever knowingly violates, or conspires to vio-  
14 late, the provisions of subsection (d) (1) of this section  
15 shall be guilty of a misdemeanor and upon conviction thereof  
16 shall be punished by a fine not to exceed \$1,000 for each  
17 violation.

18 **UNIFORM STATISTICAL PLAN AND PRICE INFORMATION**

19 **SEC. 6. (a)** The Secretary shall, after consultation with  
20 the insurers and State insurance supervisory authorities,  
21 promulgate a common, uniform statistical plan for the allo-  
22 cation and compilation of claims and loss experience data  
23 for each coverage under section 5 of this Act, and upon  
24 promulgation, such plan shall be followed by every insurer  
25 writing policies of insurance which meet the requirements

## 15

1 of section 5 of this Act, and by every rating or advisory or-  
2 ganization or statistical agent named by any such insurer  
3 to gather, compile, or report claims and loss experience data.

4 (b) Such statistical plan shall contain data pertaining  
5 to the claims and loss experience for the classes of risk in  
6 each rating territory within each coverage under section 5  
7 of this Act: *Provided, however,* That such statistical plan  
8 shall not contain data pertaining to expenses for adjusting  
9 losses, underwriting expenses, general administration ex-  
10 penses, or any other expense experience for any class of  
11 risk in each rating territory within the coverages under sec-  
12 tion 5 of this Act: *Provided further,* That in carrying out  
13 the provisions of this section, no insurer, rating, or advisory  
14 organization, or statistical agent, or any other association of  
15 insurers, shall pool, or in any manner combine, any such  
16 expenses or expense experience, or otherwise act in concert  
17 with respect thereto.

18 (c) Every insurer writing policies of insurance which  
19 meet the requirements of section 5 of this Act, and every  
20 rating or advisory organization or statistical agent named  
21 by such insurer to gather or compile claims and loss experi-  
22 ence data, shall report such data in accordance with the pro-  
23 visions of the statistical plan required by this section at such  
24 times and in such manner as the Secretary shall by rules and  
25 regulations lawfully prescribe.

1       (d) The Secretary shall require standard uniform and  
2 standard minimal—

3           (1) policy provisions for each coverage under sec-  
4 tion 5 of this Act;

5           (2) classes of risk and rating territories for each  
6 coverage under section 5 of this Act;

7 in order to accomplish the purposes of the statistical plan  
8 required by this section.

9       (e) Every insurer writing policies of insurance which  
10 meet the requirements of section 5 of this Act shall provide  
11 the Secretary with the actual rate or premium being charged  
12 for each class of risk in each rating territory within each  
13 coverage under section 5 of this Act at such times and in such  
14 manner as the Secretary shall by rules and regulations  
15 prescribe.

16       (f) The Secretary may, after consultation with the in-  
17 surers and State insurance supervisory authorities, appoint a  
18 statistical agent or agents, to receive, gather, compile, report,  
19 and analyze the claims and loss experience data, and actual  
20 rates or premiums, specified in subsections (c) and (e) of  
21 this section.

22       (g) From time to time, but not less than semiannually,  
23 the Secretary shall analyze and freely and fully make avail-  
24 able to the State insurance supervisory authorities and to  
25 the general public, with respect to every insurer writing

1 policies of insurance which meet the requirements of sec-  
2 tion 5 of this Act, a comparison of such insurer's indicated  
3 rate based upon the claims and loss experience data for  
4 each class of risk in each rating territory within each cov-  
5 erage with the actual rate or premiums being charged by  
6 the insurer for such class of risk in each rating territory  
7 within such coverage. The claims and loss experience data,  
8 and actual rates or premiums specified in subsections (c)  
9 and (e) of this section shall be made available to the general  
10 public at such times and in such manner as the Secretary  
11 shall by rules and regulations prescribe.

12 (h) Any insurer writing policies of insurance which  
13 meet the requirements of section 5 of this Act, or any rating  
14 or advisory organization or statistical agent named by any  
15 such insurer to gather, compile or report claims and loss  
16 experience data, who willfully fails to:

17 (1) follow the statistical plan promulgated in ac-  
18 cordance with subsections (a) and (b) of this section,  
19 or

20 (2) observe the prohibition in subsection (b) of  
21 this section against pooling, or in any manner combin-  
22 ing expense experience, or

23 (3) report to the Secretary, or his statistical agent  
24 or agents, the claims and loss experience data as re-  
25 quired in subsections (c) and (f) of this section, or

1           (4) follow any standard uniform or standard mini-  
2           mal policy provisions or classes of risk promulgated by  
3           the Secretary as required in subsection (d) of this sec-  
4           tion, or

5           (5) provide the Secretary, or his statistical agent  
6           or agents, with the actual rate or premium being charged  
7           for each class of risk in each rating territory within such  
8           coverage as required in subsections (e) and (f) of this  
9           section,

10          shall be guilty of a misdemeanor, and upon conviction  
11          thereof, shall be punished by a fine not to exceed \$5,000 for  
12          each violation.

13                               **ASSIGNED CLAIMS PLAN**

14                               **Organization and Maintenance**

15          SEC. 7. (a) The Secretary shall, after consultation with  
16          the insurers and State insurance supervisory authorities, or-  
17          ganize an assigned claims bureau and assigned claims plan  
18          in each State. Upon organization, each such bureau and  
19          plan shall be maintained, subject to regulation by the applica-  
20          ble State insurance supervisory authority, by the insurers  
21          writing policies of insurance under section 5 of this Act in  
22          such State. In default of the continued maintenance of an  
23          assigned claims bureau and assigned claims plan in any  
24          State in a manner considered by the Secretary to be con-

1 sistent with the provisions of this Act, the Secretary shall  
2 maintain such bureau and plan.

3 Costs of Operation

4 (b) The costs incurred in the operation of each assigned  
5 claims bureau and assigned claims plan shall be assessed  
6 against insurers in each State by the applicable State insur-  
7 ance supervisory authority according to rules and regulations  
8 that assure fair allocations among such insurers writing poli-  
9 cies of insurance under section 5 of this Act in the State, on  
10 a basis reasonably related to the volume of insurance under  
11 subsection (a) of section 5 of this Act.

12 Insurers Required to Participate

13 (c) Every insurer writing policies of insurance under  
14 section 5 of this Act is required to participate in the as-  
15 signed claims bureau and assigned claims plan in each and  
16 every State in which such insurer is authorized to write such  
17 policies of insurance.

18 Persons Entitled to Claim Through Assigned Claims Plan:

19 Benefits to Which Entitled

20 (d) Except as provided in subsection (e) of this sec-  
21 tion, each person sustaining injury (as defined in section  
22 2 (7) of this Act) may obtain the insurance benefits under  
23 subsection (a) of section 5 of this Act through the assigned

1 claims bureau and assigned claims plan in the State in which  
2 such person resides if—

3 (1) no such insurance benefits are applicable to the  
4 injury or death; or

5 (2) no such insurance benefits applicable to the  
6 injury or death can be identified; or

7 (3) the only identifiable insurance benefits under  
8 subsection (a) of section 5 of this Act applicable to  
9 the injury or death are, because of financial inability of  
10 one or more insurers to fulfill their obligations, inadequate to provide such benefits.

12 **Persons Disqualified From Receiving Benefits**

13 (e) A person shall be disqualified from receiving benefits  
14 through any assigned claims bureau and assigned claims  
15 plan established pursuant to this Act if—

16 (1) such person is disqualified under section 5 (a)  
17 (3) (B) of this Act from receiving the insurance benefits  
18 under section 5 (a) of this Act, or

19 (2) such person is the owner or registrant of a  
20 motor vehicle which was not insured under section 5 (a)  
21 of this Act at the time of its involvement in the accident  
22 out of which such person's injury arose.

23 (f) A claim or claims arising from injury or death to  
24 one person sustained in one accident and brought through  
25 the applicable assigned claims plan shall be assigned to

1 one insurer, or to the applicable assigned claims bureau,  
2 which after such assignment shall have rights and obligations  
3 as if having issued a policy of insurance containing the  
4 benefits under subsection (a) of section 5 of this Act.

#### 5 Principle of Assignment

6 (g) The assignment of claims shall be made according  
7 to rules and regulations that assure fair allocation of the  
8 burden of assigned claims among insurers doing business in  
9 the particular State on a basis reasonably related to the  
10 volume of insurance written under subsection (a) of section  
11 5 of this Act.

#### 12 Notification of Bureau by Claimant for Assignment of His 13 Claim

14 (h) A person or his legal representative claiming  
15 through an assigned claims plan shall notify the applicable  
16 bureau of his claim within the time that would have been  
17 allowed for filing an action for the insurance benefits under  
18 subsection (a) of section 5 of this Act had there been in  
19 effect identifiable coverage applicable to the claim. The  
20 bureau shall promptly assign the claim and notify the claim-  
21 ant of the identity and address of the insurer to which the  
22 claim is assigned, or against the bureau if the claim is assigned  
23 it. No action by the claimant against the insurer to which his  
24 claim is assigned, or against the bureau if the claim is assigned  
25 to it, shall be commenced later than sixty days after receipt

1 of notice of the assignment or the last date on which the  
2 action might have been commenced had it been against the  
3 insurer of identifiable coverage applicable to the claim, which-  
4 ever is later.

5 **Costs of Assigned Claims Plan**

6 (i) All reasonable and necessary costs incurred in the  
7 handling and disposition of assigned claims, including amount  
8 paid pursuant to assessments under subsection (b) of this  
9 section, may be considered in making or regulating rates for  
10 the insurance under subsection (a) of section 5 of this Act:  
11 *Provided, however,* That if such costs are considered in the  
12 rates or premiums for such insurance, the pure loss portion  
13 of such costs shall be reported separately under the uniform  
14 statistical plan provided for by section 6 of this Act, and that  
15 portion of the actual rate or premium being charged for such  
16 insurance attributable to the entire amount of such costs in-  
17 curred in the handling and disposition of assigned claims  
18 shall be reported separately under subsection (e) of section  
19 6 of this Act.

20 **Reimbursement**

21 (j) An insurer who makes an assigned claims payment  
22 shall be reimbursed, without regard to fault, by the owner or  
23 registrant of a motor vehicle which was not insured under  
24 section 5 (a) of this Act at the time of the accident out of  
25 which such assigned claim arose.

**1 INSURERS' FRAUDULENT OR ARBITRARY DENIAL OF CLAIMS**

**2 SEC. 8.** Within the discretion of any court, a person  
**3 making claim** under a policy of insurance which meets the  
**4 requirements** of section 5 of this Act may be allowed an  
**5 award** of a reasonable sum for attorney's fee and all reason-  
**6 able costs** of suit where the insurer's denial of all or part of  
**7 the claim** was fraudulent or so arbitrary as to have no reason-  
**8 able foundation.**

**9 FRAUDULENT OR EXCESSIVE CLAIMS**

**10 SEC. 9.** Within the discretion of any court, an insurer  
**11 or any person** who qualifies as a self-insurer under para-  
**12 graph (A)** of section 3 (a) (1) may be allowed an award  
**13 of a reasonable sum** as attorney's fee and all reasonable costs  
**14 of suit** for its defense against a person making claim against  
**15 such insurer or self-insurer** where such claim was fraudulent  
**16 or so excessive** as to have no reasonable foundation, and such  
**17 attorney's fee** and all such reasonable costs of suit so awarded  
**18 may be treated** as an offset against any benefits due or to  
**19 become due** to such person.

**20 ADMINISTRATION**

**21 SEC. 10.** In order to carry out the provisions and fulfill  
**22 the purpose** of this Act, the Secretary shall—

**23 (a)** consult with representatives of State agencies  
**24 charged** with the regulation of the business of insurance,

1       representatives of the private insurance business, and  
2       such other persons, organizations, and agencies of the  
3       Federal, State, or local governments as he deems neces-  
4       sary; and

5           (b) make, promulgate, amend, and repeal such  
6       rules and regulations under the procedures established in  
7       section 4 of the Administrative Procedure Act, as  
8       amended (60 Stat. 237; 5 U.S.C. 553), as he deems  
9       necessary.

10           **AUTHORIZATION AND APPROPRIATIONS**

11       SEC. 11. There are authorized to be appropriated such  
12       sums as may be necessary to carry out the provisions of this  
13       Act, including, but not limited to, the appointment of a sta-  
14       tistical agent or agents, and the organization of an assigned  
15       claims bureau and assigned claim plan in each State.

16           **SEPARABILITY CLAUSE**

17       SEC. 12. If any provision of this Act is declared uncon-  
18       stitutional, or the applicability thereof to any person or cir-  
19       cumstance is being held invalid, the constitutionality of the  
20       remainder of the Act and the applicability thereof to other  
21       persons and circumstances shall not be affected thereby.

22           **EFFECTIVE DATE**

23       SEC. 13. This Act shall become effective one year after  
24       the date of enactment.

92D CONGRESS  
1ST SESSION

# S. 946

## IN THE SENATE OF THE UNITED STATES

FEBRUARY 24 (legislative day, FEBRUARY 17), 1971

Mr. HART (for himself and Mr. MAGNUSON) introduced the following bill;  
which was read twice and referred to the Committee on Commerce

## A BILL

To promote the greater availability of motor vehicle insurance  
in interstate commerce under more efficient and beneficial  
marketing conditions.

1 *Be it enacted by the Senate and House of Representa-*  
2 *tives of the United States of America in Congress assembled,*  
3 That this Act may be cited as the "Motor Vehicle Group  
4 Insurance Act".

### 5 DEFINITIONS

6 SEC. 2. As used in this Act—

7 (1) The term "insurer" means any enterprise engaged  
8 in the business of issuing or reinsuring motor vehicle insur-  
9 ance policies in interstate commerce or engaged in the busi-

II

U.C. BERKELEY LIBRARY

## 2

1   ness of issuing motor vehicle insurance that is reinsured (in  
2   whole or in part) in interstate commerce.

3       (2) The term "group insurance" means any plan of  
4   motor vehicle insurance offered or provided to members of  
5   a group not organized solely for the purpose of obtaining  
6   insurance, under the terms of a master policy or operating  
7   agreement between an insurer and the group sponsor, and  
8   incorporating group average rating, guaranteed issue with  
9   or without minimum eligibility requirements, group experi-  
10   ence rating, employer contributions, or any other benefit to  
11   the members as insureds that they may be unable to obtain  
12   in the ordinary channels of insurance marketing on an in-  
13   dividual basis. The term "group sponsor" means the em-  
14   ployer or other representative entity of an employment-  
15   based group or the administrative representative of any other  
16   type of group.

17       (3) The term "interstate commerce" means trade or  
18   commerce among the several States, or between the District  
19   of Columbia or any possession of the United States and any  
20   State or other possession, or within the District of Columbia.

21       (4) The term "State" means any State or possession of  
22   the United States, the District of Columbia, and the Com-  
23   monwealth of Puerto Rico.

24       (5) The term "Attorney General" means the Attorney  
25   General of the United States.

**REMOVING RESTRICTIONS ON GROUP INSURANCE****SEC. 3. (a) No state shall—**

(1) prohibit, inhibit, restrict, or condition, by means of fictitious group statutes or regulations, agency licensing requirements, application of prohibitions of unfair discrimination, eligibility provisions, or otherwise, the issuance and marketing of group insurance; or

(2) penalize or deny authority to an insurer because of its engagement or intention to engage in the marketing and issuance of group insurance.

(b) No State or group of insurers operating voluntarily shall, directly or indirectly, include insureds under a plan of group insurance in the base used in determining assignments to or assessments upon an insurer under an assigned risk plan if such plan of group insurance precludes any individual underwriting by the insurer and if the group is not defined to exclude members characterized as being bad risks, unless the assigned risk plan provides a reasonable system of credit to the insurer for insureds under the group insurance plan who would otherwise be eligible for coverage under the assigned risk plan.

**ENFORCEMENT**

**SEC. 4. (a)** Whenever it shall appear to the Attorney General that any person is engaged or is about to engage in any acts or practices that constitute or will constitute a viola-

## 4

1 tion of the provisions of this Act, he shall bring an action in  
2 the proper district court of the United States to enjoin such  
3 acts or practices, and upon a proper showing, a permanent or  
4 temporary injunction or restraining order shall be granted.

5 (b) Nothing in this section shall preclude an insurer or  
6 any other person from instituting legal process to enforce  
7 their rights under this Act or from using the provisions of  
8 this Act as an otherwise valid defense in any relevant legal  
9 action brought against them.

10

## JURISDICTION

11 SEC. 5. The district courts of the United States shall have  
12 exclusive jurisdiction of violations of this Act and of all suits  
13 brought to enforce it.

92d CONGRESS  
1st Session

# S. 976

## IN THE SENATE OF THE UNITED STATES

FEBRUARY 25 (legislative day, FEBRUARY 17), 1971

Mr. HART (for himself, Mr. HARTKE, Mr. MAGNUSON, Mr. MUSKIE, Mr. PROX-  
MIRE, and Mr. RIBICOFF) introduced the following bill; which was read  
twice and referred to the Committee on Commerce

## A BILL

To amend the National Traffic and Motor Vehicle Safety Act of  
1966 in order to promote competition among motor vehicle  
manufacturers in the design and production of safe motor  
vehicles having greater resistance to damage, and for other  
purposes.

1 *Be it enacted by the Senate and House of Representa-*  
2 *tives of the United States of America in Congress assembled,*  
3 That this Act may be cited as the "Motor Vehicle Informa-  
4 tion and Cost Savings Act".

### PURPOSE

6 SEC. 2. (a) It is the purpose of this Act, (1) to amend  
7 the National Traffic and Motor Vehicle Safety Act of 1966  
8 (hereinafter referred to as "the Act") in order to establish

VII—O

★(Star Print)

U.C. BERKELEY LIBRARY

1 procedures for setting minimum property loss reduction stand-  
2 ards and to promote competition among motor vehicle manu-  
3 facturers in the design, production, and sale of motor vehicles  
4 which are less susceptible to damage in traffic accidents  
5 occurring at normal operating speeds and which lessen the  
6 risk of injury and death to occupants of motor vehicles and  
7 pedestrians involved in traffic accidents, and (2) to provide  
8 for the augmentation and implementation of certain Federal  
9 motor vehicle and highway safety standards.

10 (b) The first section of the Act (15 U.S.C. 1381) is  
11 amended to read as follows: "That the Congress finds and  
12 declares that—

13 " (1) it is necessary to establish motor vehicle safety  
14 standards for motor vehicles and equipment moving in  
15 interstate commerce, to establish testing procedures for  
16 passenger motor vehicles, to establish property loss re-  
17 duction standards, to undertake and support necessary  
18 safety research and development, and to expand the na-  
19 tional driver register; and

20 " (2) it is the purpose of this Act to reduce the  
21 number and severity of traffic accidents, the number of  
22 deaths and injuries resulting from such accidents, and  
23 the extent of property damage and economic losses re-  
24 sulting from such accidents."

## DEFINITIONS

SBC. 3. Section 102 of the Act (15 U.S.C. 1391) is amended by—

(1) inserting in paragraph (1) after “injury to persons” the following: “and unnecessary damage to motor vehicles”;

(2) adding at the end thereof the following new paragraphs:

“(14) ‘Property loss reduction’ means the reduction of economic loss suffered by the public as a result of property damage to motor vehicles involved in accidents.

“(15) ‘Property loss reduction standards’ means a minimum standard for motor vehicle performance, or motor vehicle equipment performance, which is practicable, which meets the need for motor vehicle property loss reduction and which provides objective criteria.

“(16) ‘Make’, when used in describing a motor vehicle, means the manufacturer’s trade name or other designation for a particular line of motor vehicles.

“(17) ‘Model’ means a particular size and style of body of any make of motor vehicle, including distinctive sizes of sedans, convertibles, station wagons, and trucks, and such other classifications as the Secretary may prescribe.

“(18) ‘Passenger motor vehicle’ means any motor

1 vehicle manufactured primarily for the transportation of its  
2 operator and passengers upon the public streets, roads, and  
3 highways.”

4 **PROPERTY LOSS REDUCTION STANDARDS**

5 **SEC. 4.** Title I of the Act (15 U.S.C. 1391 et seq.) is  
6 amended by adding at the end thereof the following new  
7 sections:

8 (a) the words “or property loss reduction” after  
9 the words “motor vehicle safety” wherever they occur  
10 following section 102;

11 (b) the words “or property loss reduction stand-  
12 ards” after the words “motor vehicle safety standards”  
13 or “safety standard” wherever they occur following  
14 section 102 (except section 103 (h) ) ; and

15 (c) the words “or property loss reduction stand-  
16 ards” after the words “motor vehicle safety standard”  
17 wherever they occur following section 102 (except  
18 section 103 (g) ) .

19 **PUBLIC DISCLOSURE OF COMPARATIVE SAFETY AND SUS-**  
20 **CEPTIBILITY TO DAMAGE OF PARTICULAR MOTOR**  
21 **VEHICLES AND ADDITIONAL STANDARDS**

22 **SEC. 5.** Title I of the Act (15 U.S.C. 1391 et seq.) is  
23 amended by adding at the end thereof the following new  
24 sections:

25 “SEC. 125. (a) The Secretary shall develop and pre-

1 scribe by regulations issued not later than July 1, 1972, a  
2 system of tests and testing procedures designed to allow a  
3 determination and comparison of the susceptibility to dam-  
4 age of passenger motor vehicles involved in traffic accidents  
5 which reasonably may be anticipated to occur at normal  
6 speeds and under normal operating conditions, including,  
7 but not limited to, collisions at speeds of five, ten, and  
8 fifteen miles per hour.

9       “(b) The Secretary shall, as soon as possible, after  
10 July 1, 1972, promulgate property loss reduction standards  
11 which will minimize economic losses associated with motor  
12 vehicle accidents. These standards shall be compatible with  
13 safety standards issued to protect motor vehicle occupants.

14       “(c) The Secretary shall, as soon as practicable, after  
15 July 1, 1972, promulgate a property loss reduction standard  
16 which requires that all motor vehicles manufactured after  
17 January 1, 1975, and offered for sale in the United States,  
18 are so designed and constructed with energy absorbing  
19 bumpers capable of withstanding impacts front and rear of  
20 5 miles per hour into a solid, fixed barrier (as prescribed  
21 by the Society of Automotive Engineers Standard J850)  
22 and the vehicle shall withstand such impacts with a mini-  
23 mum prescribed amount of damage as may be determined  
24 by the Secretary.

25       “(d) (1) The Secretary shall undertake a study of the

## 6

1 feasibility of developing tests and testing procedures designed  
2 to allow a determination and comparison of the risk of per-  
3 sonal injury or death to occupants of passenger motor ve-  
4 hicles resulting from traffic accidents which reasonably may  
5 be anticipated to occur at normal speeds and under normal  
6 operating conditions. The Secretary shall report the results  
7 of such study, and his findings and recommendations, in-  
8 cluding any recommendations for additional legislation he  
9 deems necessary, to the President and the Congress by  
10 July 1, 1972.

11 “(2) If the Secretary finds that such tests are feasible  
12 he shall develop and prescribe by regulations issued as soon  
13 as may be practicable such a system of tests and testing  
14 procedures.

15 “SEC. 126. (a) Each manufacturer of motor vehicles  
16 shall test production models of every make and model of  
17 passenger motor vehicle manufactured or imported by him in  
18 accordance with the regulations promulgated by the Secre-  
19 tary under the provisions of section 125 of this title, and  
20 shall furnish the results of such testing, including such data  
21 as the Secretary deems necessary, to the Secretary.

22 “(b) No manufacturer shall sell, offer for sale, intro-  
23 duce or deliver for introduction in interstate commerce, or  
24 import into the United States—

25 “(1) any passenger motor vehicle manufactured on

1 or after January 1, 1973, unless production models of  
2 the make and model of such motor vehicle have been  
3 tested in accordance with the regulations promulgated  
4 by the Secretary under section 125 (a) of this Act; or

5 “(2) any passenger motor vehicle manufactured on  
6 or after a date one hundred and twenty days after the  
7 date on which regulations governing tests and testing  
8 procedures are promulgated by the Secretary under the  
9 provisions of section 125 (b) of this Act unless a pro-  
10 duction model of the make and model of such motor  
11 vehicle has been tested in accordance with such reg-  
12 ulations.

13 “SEC. 127. (a) The Secretary shall compile informa-  
14 tion submitted to him under testing programs carried out  
15 under the provisions of sections 125 and 126 of this Act,  
16 and furnish it to the public in a simple and readily under-  
17 standable form in order to facilitate comparison among the  
18 various makes and models of passenger motor vehicles with  
19 respect to the factors analyzed by such testing programs.  
20 The information shall include, but not be limited to a com-  
21 parative analysis of the cost of repairing motor vehicles  
22 under section 125(a) and if practicable under section  
23 125(d). The Secretary shall require that the results of such  
24 testing be made available to prospective purchasers of pas-

1 senger motor vehicles by the manufacturer of such motor  
2 vehicles prior to their sale.

3 “(b) The Secretary shall—

4 “(1) make such information available to insurance  
5 companies and business organizations engaged in the  
6 business of selling or underwriting motor vehicle insur-  
7 ance in interstate commerce, for use in determining  
8 premium rates for insurance covering property damages  
9 and personal injury related to the factors tested under  
10 the provisions of section 126 of this Act. Information  
11 furnished shall include, but not be limited to, identifica-  
12 tion of parts, components, systems, and subsystems  
13 damaged or displaced in the motor vehicles tested; and

14 “(2) report to the President and the Congress on  
15 February 1, 1973, on the extent to which the motor  
16 vehicle insurance industry is utilizing such information  
17 in the determination of insurance premium rates, to-  
18 gether with such additional findings and recommenda-  
19 tions, including recommendations for additional legis-  
20 lation, as he deems appropriate. The Secretary is au-  
21 thorized to conduct such studies and surveys as may be  
22 necessary to carry out the purposes of this Act.

23 “(3) The Secretary, not later than February 1,  
24 1974, shall establish procedures requiring the automo-  
25 bile dealers to provide insurance cost data to prospective

1 purchasers that would enable the prospective purchasers  
2 to compare the difference in costs for auto insurance on  
3 the various makes and models of passenger motor vehi-  
4 cles having different occupant injury severity or vehicle  
5 property damage characteristics.

6 "SEC. 128. The Secretary shall, as soon as practicable,  
7 promulgate Federal motor vehicle safety and property loss  
8 reduction standards which require that all motor vehicles  
9 manufactured after January 1, 1975, and offered for sale in  
10 the United States, are so designed and constructed as to  
11 facilitate motor vehicle inspection, and to facilitate the re-  
12 pairs necessary to meet the requirements of such inspection."

13 JUDICIAL REVIEW

14 SEC. 6. Section 105 (a) (1) of the Act (15 U.S.C.  
15 1394 (a) (1) ) is amended by inserting after the words "any  
16 order under section 103" the following: "or 128, or any  
17 regulation issued under section 125."

18 SAFETY RESEARCH

19 SEC. 7. Section 106 (a) of the Act (15 U.S.C.  
20 1395 (a) ) is amended by redesignating paragraphs (2)  
21 and (3) as paragraphs (3) and (4), respectively, and  
22 inserting immediately after paragraph (1), the following  
23 new paragraph:

24 "(2) collecting data from any source for the pur-

1 pose of determining the relationship between passenger  
2 motor vehicle performance and design characteristics and  
3 (A) property damage resulting from motor vehicle col-  
4 lisions; and (B) the occurrence of personal injury or  
5 death resulting from such accidents;"

6 COOPERATION WITH OTHER AGENCIES

7 SEC. 8. Section 107 of the Act (15 U.S.C. 1396) is  
8 amended by striking out the period at the end thereof, and  
9 inserting in lieu thereof a semicolon and the following:

10 "(3) tests and testing procedures established under  
11 section 125 and methods for inspecting and testing to  
12 determine compliance with such tests and testing  
13 procedures."

14 PROHIBITION AND EXCEPTIONS

15 SEC. 9. Section 108 (b) of the Act (15 U.S.C. 1397  
16 (b) ) is amended by—

17 (1) inserting in paragraphs (1), (3), and (5) of  
18 such section, immediately after the words "subsection  
19 (a)" wherever they appear in such paragraphs, a  
20 comma and the words "and section 126 (b),"; and

21 (2) amending paragraphs (2) and (3) of such  
22 section 108 to read as follows:

23 "(2) Paragraph (1) of subsection (a), and section  
24 126 (b) shall not apply to any person who establishes that  
25 he did not have reason to know in the exercise of due care

1 that such vehicle or item of motor vehicle equipment is not  
2 in conformity with applicable Federal motor vehicle safety  
3 standards or property loss reduction standard or, in the case  
4 of a passenger motor vehicle, is not of a make and model  
5 which has been tested in accordance with the requirements  
6 of section 126 (b) , or to any person who, prior to such first  
7 purchase, holds a certificate issued by the manufacturer or  
8 importer of such motor vehicle or motor vehicle equipment,  
9 to the effect that such vehicle or equipment conforms to all  
10 applicable Federal motor vehicle safety standards, and (in  
11 the case of a passenger motor vehicle) is of a make and  
12 model which has been tested in accordance with the require-  
13 ments of section 126 (b) , unless such person knows that  
14 such motor vehicle or motor vehicle equipment does not so  
15 conform or (in the case of a passenger motor vehicle) is not  
16 of a make or model which has been so tested.

17 “(3) A motor vehicle or item of motor vehicle equip-  
18 ment offered for importation in violation of paragraph (1)  
19 of subsection (a) , or section 126 (b) , shall be refused ad-  
20 mission into the United States under joint regulations issued  
21 by the Secretary of the Treasury and the Secretary; except  
22 that the Secretary of the Treasury and the Secretary may,  
23 by such regulations, authorize the importation of such ve-  
24 hicle or item of motor vehicle equipment into the United  
25 States upon such terms and conditions (including the fur-

U.C. BERKELEY LIBRARY

1 nishing of a bond) as may appear to them appropriate to  
2 insure that any such motor vehicle or item of motor vehicle  
3 equipment will be brought into conformity with any ap-  
4 plicable Federal motor vehicle safety or property loss re-  
5 duction standard prescribed under this title, brought into  
6 conformity with the requirements of section 126 (b), or will  
7 be exported or abandoned to the United States.”.

8

## PENALTIES

9 SEC. 10. Section 109 (a) of the Act (15 U.S.C.  
10 1398 (a)) is amended to read as follows:

11 “SEC. 109. (a) Whoever—

12 “(1) violates any provision of—

13 “(A) section 108 (relating to motor vehicle  
14 safety standards or property loss reduction  
15 standards) ;

16 “(B) subsection (c) or (d) of section 112  
17 (relating to keeping records and reporting data) ;

18 “(C) section 114 (relating to certification) ; or

19 “(D) section 126 (relating to passenger motor  
20 vehicle testing) ; or

21 “(2) refuses to permit an inspection authorized  
22 under section 112 (a) and (b) shall be subject to a  
23 civil penalty of not to exceed \$5,000 for each such  
24 violation or refusal. A violation of a provision of such

1 sections or regulations issued thereunder, shall consti-  
2 tute a separate violation with respect to each motor  
3 vehicle sold, offered for sale, introduced or delivered for  
4 introduction in interstate commerce, or imported into  
5 the United States in violation of such provisions or  
6 regulations, and with respect to each failure or refusal  
7 to allow or perform an act required thereby. A refusal  
8 to allow an inspection authorized under section 112 (a)  
9 and (b), or a refusal or failure to allow or perform an  
10 act required thereby, shall constitute a separate viola-  
11 tion with respect to each day such refusal or failure  
12 continues.”

13 **INJUNCTIVE RELIEF**

14 **SEC. 11.** Section 110(a) of the Act (15 U.S.C.  
15 1399(a)) is amended by inserting in the first sentence  
16 thereof, immediately after the words “standards prescribed  
17 pursuant to this title”, a comma and the following: “or to  
18 the requirements of section 126(b)”.

19 **REPURCHASE OR REPLACEMENT**

20 **SEC. 12.** Section 111(a) of the Act (15 U.S.C.  
21 1400(a)) is amended by inserting immediately after the  
22 words “applicable Federal motor vehicle safety standards”  
23 or property loss reduction standards the following: “or the  
24 requirements of section 126(b)”.

## 14

## 1 INSPECTION OF MANUFACTURING FACILITIES

2 SEC. 13. Section 112(b) of the Act (15 U.S.C.  
3 1401(b)) is amended by inserting, immediately after the  
4 words "or are held for sale after such introduction", a  
5 comma and the following: "or are held after being tested  
6 in accordance with the requirements of section 126(b)".

## 7 CERTIFICATION OF CONFORMITY

8 SEC. 14. Section 114 of the Act (15 U.S.C. 1403) is  
9 amended by inserting before the period at the end of the  
10 first sentence a comma and the following: "and that the  
11 particular make and model of such motor vehicle has  
12 been tested in accordance with the requirements of section  
13 126(a)".

## 14 TITLE V

## 15 DIAGNOSTIC INSPECTIONS, REGISTRATIONS AND TITLING

## 16 STANDARDS

17 SEC. 501. (a) The Secretary of Transportation shall,  
18 not later than January 1, 1973, amend highway safety pro-  
19 gram standard number 1, relating to periodic motor vehicle  
20 inspection, issued June 27, 1967, under the provisions of  
21 section 402(a) of title 23, United States Code, to include  
22 the following additional provisions:

23 (1) The standard shall require inspection of a motor  
24 vehicle whenever the title to the motor vehicle is transferred  
25 for purposes other than resale, and whenever the motor

1 vehicle sustains damage if any safety-related mechanism,  
2 subsystem, or functional nonoperational part, as defined by  
3 the Secretary, is damaged.

4 (2) The standard shall require that a certificate of  
5 safe operating condition shall be delivered by the seller of a  
6 motor vehicle to the purchaser at the time of sale. The cer-  
7 tificate shall be prepared and signed by an inspector trained  
8 to perform this duty. The inspector shall be certified by the  
9 State in accordance with provisions established by the Sec-  
10 retary. No motor vehicle inspector may be certified by any  
11 State if he owns or receives any benefit in or from a busi-  
12 ness or enterprise engaged in the repair or sale of motor  
13 vehicles, automotive repair parts or accessories: *Provided,*  
14 That upon approval of the Secretary, a State may certify a  
15 motor vehicle inspector receiving such benefit where the  
16 vehicle population to be served is insufficient to make inde-  
17 pendent motor vehicle inspectors feasible and such State  
18 makes provision for protecting the public from any conflict  
19 of interest resulting from such certification.

20 (3) The standard shall be expressed in terms of motor  
21 vehicle safety performance applicable to new or used motor  
22 vehicles.

23 (b) The Secretary shall, not later than January 1,  
24 1973, amend highway safety program standard numbered 2,  
25 relating to motor vehicle registration, issued on June 27,

1 1967, under the provisions of section 402 (a) of title 23,  
2 United States Code, to include requirements for a State motor  
3 vehicle registration and uniform certificate of title program  
4 similar to the registration and title program contemplated by  
5 the Uniform Motor Vehicle Code and Model Traffic Ordinance,  
6 chapter 3, "Certificates of Title and Registration of  
7 Vehicles" revised 1968 and published by the National Committee  
8 on Uniform Traffic Laws and Ordinances, Washington,  
9 District of Columbia.

10 **REPORTS ON IMPLEMENTATION**

11 **SEC. 502. (a)** The Secretary shall report to the President  
12 and Congress by January 1, 1972, the extent to which  
13 the States have implemented programs in accordance with the  
14 provisions of highway safety program standards numbered 1  
15 and 2, relating to periodic motor vehicle inspection and motor  
16 vehicle registration, respectively, as issued on June 27, 1967,  
17 and make legislative recommendations for Federal financial  
18 and other assistance, as he deems necessary in order to facilitate  
19 compliance by the States by January 1, 1973.

20 **(b)** The Secretary shall provide for the States financial  
21 incentive programs for establishing the inspection and titling  
22 standards of this title. Each State certified by the Secretary  
23 as being in compliance with the provisions of this title shall,  
24 after January 1, 1973, receive not less than 10 per centum  
25 nor more than 50 per centum of the annual costs of such pro-

1 grams, the percentage to be determined by the Secretary  
2 based on degree of compliance. The funds for these incentive  
3 programs shall be paid from the Federal Aid Highway Trust  
4 Funds apportioned on or after January 1, 1973.

5 (c) The Secretary shall report to the President and  
6 Congress by January 1, 1974, the extent to which the  
7 States have implemented programs in accordance with the  
8 provisions of section 501 of this Act, and make legislative  
9 recommendations, for Federal financial and other assistance,  
10 as he deems necessary to facilitate complete compliance by  
11 the States not later than January 1, 1975.

12 (d) Not later than July 1, 1973 the Secretary shall—

13 (1) certify each State program of motor vehicle  
14 inspection and motor vehicle registration which meets  
15 the requirements of the applicable standard;

16 (2) the Secretary shall not approve any State high-  
17 way safety program under this section which does not  
18 establish motor vehicle inspection or motor vehicle  
19 registration programs meeting the requirements of  
20 section 501 of this title and the appropriate Federal  
21 highway safety program standard; and

22 (3) funds authorized to be appropriated to carry  
23 out the provisions of section 501 and this section shall  
24 be used to aid the States to conduct the highway safety  
25 program approved in accordance with subsection (a),

1 (b), and (c) hereof. Federal aid highway funds ap-  
2 portioned on or after January 1, 1975, to any State  
3 which is not implementing a highway safety program  
4 approved by the Secretary in accordance with this sec-  
5 tion shall be reduced for the first year of noncompliance  
6 by amounts equal to 10 per centum of the amounts  
7 which would otherwise be apportioned to such State  
8 under section 104 of title 23, United States Code, with  
9 the reduction of an additional 10 per centum for each  
10 succeeding year of noncompliance, but not in excess  
11 of a total of 50 per centum, until such time as the  
12 State is implementing an approved highway safety  
13 program certified by the Secretary in accordance with  
14 this subparagraph (d). Any amount which is with-  
15 held from apportionment to any State hereunder shall  
16 be reapportioned to the other States.

17 (e) In order to carry out the provisions of this sec-  
18 tion, the Secretary may—

19 (A) assist, by contract, grant, or any other arrange-  
20 ment, any State in establishing or improving programs  
21 of periodic motor vehicle inspection and motor vehicle  
22 registration;

23 (B) use the personnel, facilities, and information  
24 of Federal agencies, and of State and local public

1 agencies, with the consent of such agencies, with or  
2 without reimbursement for such use;

3 (C) enter into contracts or other arrangements and  
4 modifications thereof, and make advance, progress, and  
5 other necessary payments;

6 (D) obtain the services of experts and consultants  
7 in accordance with the provisions of section 3109 of  
8 title 5, United States Code;

9 (E) issue, amend, and repeal such rules and regu-  
10 lations as may be necessary; and

11 (F) take such other appropriate action as may be  
12 necessary.

13 SEC. 503. There are authorized to be appropriated to  
14 the Department of Transportation such sums as may be  
15 necessary to carry out the provisions of this Act.

92<sup>d</sup> CONGRESS  
1<sup>ST</sup> SESSION

# S. CON. RES. 23

---

IN THE SENATE OF THE UNITED STATES

APRIL 29, 1971

Mr. MAGNUSON (by request) submitted the following concurrent resolution;  
which was referred to the Committee on Commerce

---

## CONCURRENT RESOLUTION

To express the sense of Congress with regard to the importance of adoption by the States of no-fault automobile insurance and accident compensation systems; providing guiding principles referable to such compensation systems; and requesting that the Secretary of Transportation assist and interact with the States with respect to the adoption of such no-fault automobile insurance and accident compensation systems, thereafter reporting results to Congress.

Whereas the existing system for compensating motor accident victims results in the unavailability of any benefits to many persons sustaining loss arising out of motor vehicle accidents, including many seriously injured persons and the dependents of many persons killed in such accidents; and

V

Whereas the existing system's uneven allocation of compensation benefits results in the excessive compensation of many persons sustaining only minor loss, and whereas by contrast many persons with severe and permanently crippling injuries recover only a fraction of their losses in compensation benefits from the system; and

Whereas administration of the system consumes an inordinate amount of resources which might be put to better use in compensating accident victims; and

Whereas the system's benefits tend to be ill timed and unresponsive to victims' needs both because of long delays in payment and because benefits are predominantly in the form of lump-sum payments, and whereas effective rehabilitation of the accident victim tends to be a practical impossibility under the system; and

Whereas the system is supported by, and dependent upon, compulsory insurance or financial responsibility laws which exert varying degrees of compulsion upon motorists to purchase liability insurance without invariably assuring motorists of the availability of automobile insurance; and

Whereas the counterproductive regulatory pressures placed by the system on insurers has led to the development of socially undesirable competition in risk selection accompanied by arbitrary and capricious declinations of insurance, cancellations, and refusals of renewal with the consequent growth of a high-risk automobile insurance market serviced in some cases by insurers of questionable financial stability; and

Whereas the system has imposed intolerable burdens on State officials responsible for regulating the rating, underwriting, and claims practices of insurers and responding to consumer complaints relating thereto; and

Whereas the system has placed an unreasonable workload on the Federal and State courts which have been forced to devote a disproportionate part of their time and resources to motor vehicle accident civil litigation; and

Whereas the system has resulted in the denial of substantial and equal justice to seriously injured accident victims who are unable to withstand the financial burdens consequent upon long court delays and who are, therefore, forced into inadequate settlements of their claims; and

Whereas the existing liability insurance system renders it impossible rationally to allocate insurance premium costs so as to reflect the ability of a motor vehicle to protect its occupants from serious injury in the event of a crash or to reflect differing costs of repairing motor vehicles; and

Whereas, however, prompted by the Automobile Insurance and Accident Insurance Study mandated by Congress, the hearings of congressional committees and the various hearings and studies conducted by many State legislatures, it is now almost universally conceded that there is an imperative need for prompt and far-reaching reform; and

Whereas one State, the Commonwealth of Massachusetts, has taken the lead by enacting the first partial no-fault plan in the country and many of the State legislatures are even now considering far-reaching reforms suited to the needs of their constituencies; and

Whereas the principal problems and abuses with respect to automobile insurance clearly stem from defects in the system for compensating accident victims and from the compulsions upon motorists to obtain the insurance which sustains and upholds that system rather than from defects in the insur-

ance institution or in its regulation by the several States;  
and

Whereas assumption of the present comprehensive State regulatory authority over automobile insurance by the Federal Government would be fraught with great and grave consequences giving rise to issues and problems of great magnitude, and is highly undesirable; and

Whereas mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform; and

Whereas one State, Massachusetts, has taken an important step toward the principles endorsed herein, and others promise to do so soon so that variants of the plan we endorse will, in the laboratory of the several States, soon be proved and perfected by experience: Now, therefore, be it

1       *Resolved by the Senate (the House of Representatives*  
2       *concurring)*, That it is the sense of the Congress that the  
3       regulation of insurance should, in general, continue with the  
4       States, subject to the admonition, however, that Congress  
5       cannot, and will not, long ignore the need for evolving new  
6       and updated approaches to insurance and accident compensation.  
7       sation.

8       That it is the further sense of the Congress that there  
9       must evolve at the State level a rational, equitable, and compatible  
10      reparation system for motor vehicle accident victims  
11      supported and sustained by a similarly rational, equitable, and  
12      compatible private insurance system, such combined system  
13      to be built upon the following principles:

1       1. Basic benefits should be forthcoming to the injured  
2 person on a first-party, contractual basis to the end that  
3 such person would be receiving benefits from the insurer with  
4 whom he has contracted and to whom he has paid his pre-  
5 miums and to the further end that competition among insurers  
6 would take the form of competition to provide prompter and  
7 more effective compensation for the premium payer.

8       2. Basic benefits under the reparations system should be  
9 payable to all accident victims without regard to fault, ex-  
10 cluding, of course, those who willfully injure themselves.

11       3. Such benefits should provide compensation for all eco-  
12 nomic loss, subject to reasonable deductibles and limits, and  
13 the tort lawsuit should be eliminated, at least pro tanto, avoid-  
14 ing the adversary process for the mass of accidents.

15       4. The function of the reparations system should be to  
16 afford adequate, but not excessive, compensation to the acci-  
17 dent victim at minimum cost. Therefore, the benefits obtain-  
18 able by the accident victim from other benefit sources should  
19 be coordinated and meshed with those obtainable from the  
20 automobile accident reparations system with a view toward  
21 internalizing automobile accident loss costs by making auto-  
22 mobile insurance the primary benefit source whenever  
23 feasible.

24       5. Maximum choice should be afforded the motorist in  
25 selecting his insurance source provided the coverage complies

1 with the principles for the required minimum mandatory  
2 coverage.

3 6. Rehabilitation, avocational as well as vocational,  
4 should be a primary function and objective of the compensa-  
5 tion system.

6 That it is the further sense of the Congress that the  
7 Secretary of Transportation be authorized and directed to  
8 request that the Council of State Governments, using the  
9 appropriate instrumentalities, develop model legislation for  
10 submission to the States for their consideration. The Secre-  
11 tary is further authorized and directed to analyze the ac-  
12 tions of the States, their legislatures and insurance regulatory  
13 officials, to determine to what extent such States act here-  
14 after to bring about motor vehicle insurance and accident  
15 compensation systems consistent with the intent of this  
16 resolution; to provide technical assistance to and interact  
17 with such States, their legislatures and insurance regulatory  
18 officials, in effecting in all the States compensation systems  
19 consistent with such principles, and to report such progress  
20 as has been made, or is being made, in effecting such com-  
21 pensation systems, with a final report to be made by the  
22 Secretary not later than twenty-five months hereafter de-  
23 tailing the action taken by each State in moving toward or  
24 providing an automobile accident compensation system con-  
25 sistent with these principles; the experience of the States

1 with these systems; and concluding with the Secretary's  
2 views regarding the feasibility of attaining a satisfactory and  
3 compatible motor vehicle accident reparations system with-  
4 out further Federal legislation.

THE GENERAL COUNSEL OF THE TREASURY,  
Washington, D.C., July 21, 1971.

HON. WARREN G. MAGNUSON,  
Chairman, Committee on Commerce,  
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: Reference is made to your request for the views of this Department on S. 945, "Uniform Motor Vehicle Insurance Act."

The bill would provide a comprehensive system of "no fault" motor vehicle insurance to be applied throughout the country. Operation of a motor vehicle upon the public streets, roads, or highways of any state would be prohibited unless such vehicle was insured under a policy meeting the requirements set forth in the act. Tort liability would be provided for only in cases of catastrophic harm.

The Administration has proposed S. Con. Res. 23. Under the circumstances, the Department would recommend favorable action on S. Con. Res. 23 in lieu of action on S. 945.

The Department has been advised by the Office of Management and Budget that there is no objection from the standpoint of the Administration's program to the submission of this report to your Committee.

Sincerely yours,

SAMUEL R. PIERCE, Jr.,  
General Counsel.

GENERAL COUNSEL OF THE DEPARTMENT OF COMMERCE,  
Washington, D.C., September 1, 1971.

HON. WARREN G. MAGNUSON,  
Chairman, Committee on Commerce,  
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: This is in further reply to your request for the views of this Department concerning S. 945, a bill "to regulate interstate commerce and to provide for the general welfare by requiring certain insurance as a condition precedent to using the public streets, roads, and highways in order to have an efficient system of motor vehicle insurance which will be uniform among the States, which will guarantee the continued availability of such insurance, and the presentation of meaningful price information, and which will provide sufficient, fair, and prompt payment for rehabilitation and losses due to injury and death arising out of the operation and use of motor vehicles within the channels of interstate commerce, and otherwise affecting such commerce,"

to be cited as the "Uniform Motor Vehicle Insurance Act."

This bill would prohibit the registration or operation of any motor vehicle not covered by an insurance policy providing for payment of economic loss benefits, without regard to fault, with provision for optional catastrophic coverage. Applications for such policies could not be rejected by an insurer nor could they be cancelled without cause. The Secretary of Transportation would be required to promulgate a common, uniform statistical plan for the allocation and compilation of loss experience data. In addition, the Secretary would be required to organize an assigned claims bureau and assigned claims plan in each State in which all insurers would be required to participate.

We note that your committee recently drafted another no-fault insurance proposal, Committee Print No. 1, which differs from S. 945 in several respects: (1) it eliminates all tort liability for owners, operators or users of insured motor vehicles (except in cases of criminal conduct); and (2) it requires no-fault insurance policies to provide unlimited benefits, to cover property damage losses and to offer optional coverage for motor vehicle property damage and for pain and suffering.

The Department of Commerce recommends against enactment of both S. 945 and Committee Print No. 1.

Instead, we favor the approach embodied in S. Con. Res. 23, which has the support of the Secretary of Transportation, based on an exhaustive study of automobile accident insurance undertaken in accordance with P.L. 90-313. S. Con. Res. 23 expresses the sense of the Congress that the States should, in general, continue to regulate automobile accident insurance subject to the Congressional admonition that new and updated approaches to insurance and accident compensation must be evolved.

U.C. BERKELEY LIBRARY

The sense of the Congress embodied in S. Con. Res. 23 includes no-fault coverage and provides principles for State legislation. The Secretary of Transportation would analyze action taken by the States; provide them with technical assistance; and report not later than twenty-five months after adoption of S. Con. Res. 23 on progress made by the States in carrying out the intent of Congress as well as on his views regarding the feasibility of attaining a satisfactory and compatible motor vehicle accident compensation system without further Federal legislation.

We have been advised by the Office of Management and Budget that there would be no objection to the submission of this report to the Congress from the standpoint of the Administration's program.

Sincerely,

WILLIAM N. LETAN,  
General Counsel.

COMPTROLLER GENERAL OF THE UNITED STATES,  
Washington, D.C., March 29, 1971.

HON. WARREN G. MAGNUSON,  
Chairman, Committee on Commerce,  
U.S. Senate.

DEAR MR. CHAIRMAN: By letter of March 8, 1971, you requested our comments on S. 976, 92d Congress, entitled: "A BILL To amend the National Traffic and Motor Vehicle Safety Act of 1966 in order to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage, and for other purposes."

While we have no special information as to the advantages or disadvantages of this measure and, therefore, make no comments concerning its enactment, we recommended the addition of provisions for records retention and access to records for the purpose of audit. Paragraphs (A) and (C) of subsection 502 (e) authorize the Secretary of Transportation to enter into grants, contracts or any other arrangement, including such assistance to States, in order to carry out the provisions of section 502. Since there are no record provisions in section 502, we suggest the addition of subsections (f) and (g) as follows:

"(f) Each recipient of assistance under this section pursuant to grants, contracts or any other arrangement entered into under other than competitive bidding procedures shall keep such records as the Secretary of Transportation shall prescribe, including records which fully disclose the amount and disposition by such recipient of the proceeds of such assistance, the total cost of the project or undertaking in connection with which such assistance is given or used, and the amount of that portion of the cost of the project or undertaking supplied by other sources, and such other records as will facilitate an effective audit.

"(g) The Secretary of Transportation and the Comptroller General of the United States, or any of their duly authorized representatives, shall have access for the purpose of audit and examination to any books, documents, papers, and records of the recipients that are pertinent to the grants, contracts or any other arrangement entered under this section under other than competitive bidding procedures."

Under section 202 of the Intergovernmental Cooperation Act of 1968, Pub. L. 90-577, 82 Stat. 1101, the Comptroller General and heads of Federal agencies have access to records pertaining to grants-in-aid received by States. However, section 202 does not cover contracts or any other arrangement for financial assistance except grants to States.

The language in lines 1 through 3 of page 15 (section 501(a)(1)) is garbled and should be clarified. Section 14(a)(1) of S. 4331, 91st Congress, 2d session, which is otherwise identical to section 501(a)(1) of S. 976 reads as follows in place of the garbled language:

"vehicle sustains damage if any safety-related mechanism, subsystem, or functional nonoperational part, as defined by the Secretary, is damaged."

Sincerely yours,

BOB KELLER,  
Assistant Comptroller General of the United States.

OFFICE OF THE DEPUTY ATTORNEY GENERAL,  
Washington, D.C., May 28, 1971.

HON. WARREN G. MAGNUSON,  
Chairman, Committee on Commerce,  
U.S. Senate, Washington, D.C.

DEAR SENATOR: This is in response to your request for the views of the Department of Justice on S. 976, a bill "To amend the National Traffic and Motor Vehicle Safety Act of 1966 in order to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage, and for other purposes."

The preliminary sections of the bill would broaden the declaration of purposes contained in the Act of 1966 and add new definitions. Substantive provisions direct the Secretary of Transportation to develop and prescribe regulations by July 1, 1972, establishing a system of tests and test procedures for determining susceptibility to damage of passenger cars in low speed collisions. Cars manufactured subsequent to January 1, 1973 would be required to be subjected to the tests by the manufacturers and no car which had not been so tested could be sold or delivered in interstate commerce. It would be required that the results of such testing be made available to prospective purchasers by the manufacturer.

The Secretary of Transportation would also be required to promulgate property loss reduction standards designed to minimize economic losses associated with automobile accidents and to promulgate a standard requiring energy absorbing bumpers in all cars manufactured after January 1, 1974.

The bill directs the Secretary of Transportation to conduct a feasibility study regarding the development of tests to determine anticipated injuries to occupants of motor vehicles in collisions and to report his findings and recommendations to the President and Congress by July 1, 1972. If tests are found feasible, the Secretary would be required to implement the testing by prescribing regulations.

The Secretary of Transportation would be required to make available to the public and disseminate to insurance companies information submitted to him from the testing programs and report to the President and Congress the extent to which such information is utilized in determining insurance rates. By February 1, 1975, car dealers would be required to provide comparative cost data on auto insurance to prospective purchasers of vehicles with different occupant injury severity or property damage characteristics.

In addition the bill would strengthen and implement vehicle inspection standards and establish a nationwide uniform titling system.

Under the terms of the bill, the Secretary of Transportation would report to the President and Congress by January 1, 1974, on the extent to which the States have implemented programs in accordance with those provisions of the bill concerned with inspection and registration standards. Financial incentive programs would be provided for the States for establishing the inspection and titling standards.

Whether this legislation should be enacted involves questions as to which the Department of Justice defers to the Department of Transportation.

The Office of Management and Budget has advised that there is no objection to the submission of this report from the standpoint of the Administration's program.

Sincerely,

RICHARD G. KLEINDIENST,  
Deputy Attorney General.

THE GENERAL COUNSEL OF THE TREASURY,  
Washington, D.C., August 4, 1971.

HON. WARREN G. MAGNUSON,  
Committee on Commerce,  
U.S. Senate, Washington, D.C.

DEAR MR. CHAIRMAN: Reference is made to your request for the views of this Department on S. 976, "To amend the National Traffic and Motor Vehicle Safety Act of 1966 in order to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance

to damage, and for other purposes", which may be cited as the "Motor Vehicle Information and Cost Savings Act."

This proposed bill authorizes the Secretary of Transportation :

1. To issue regulations, no later than July 1, 1972, on a system of test and testing procedures to determine the susceptibility to damage of passenger motor vehicles resulting from traffic accidents occurring at normal speeds and under normal conditions.

2. To determine, if tests can be designed to allow a determination and comparison of the risk of personal injury or death to occupants of passenger motor vehicles resulting from traffic accidents occurring at normal speeds and under normal operating conditions, and if such tests are feasible, to prescribe them.

3. To prescribe, after July 1, 1972, property loss reduction standards, which are compatible with safety standards issued to protect motor vehicle occupants.

4. To promulgate a property loss reduction standard which would require that all motor vehicles manufactured after January 1, 1975, be designed and constructed with energy absorbing bumpers capable of withstanding impacts front and rear of five miles per hour into a solid fixed barrier and all such motor vehicles be able to withstand such impacts with a minimum amount of damage.

5. To promulgate Federal motor vehicles safety and property loss reduction standards which require that vehicles be so designed and constructed so as to facilitate inspection and repairs.

After the two above-mentioned testing procedures covering passenger motor vehicles are prescribed and made effective by regulations, the bill would require manufacturers to test production models and furnish the results to the Secretary of Transportation, and would forbid the commercial importation of passenger motor vehicles whose manufacturers had not complied.

After the three standards had been promulgated and made effective, the bill would prohibit the commercial importation of any vehicles that did not conform to property loss reduction standards, or standards on bumper design and construction. Vehicles which did not meet design or construction standards intended to facilitate inspection or repair of motor vehicles would be prohibited under the provisions of the existing statute (15 U.S.C. 1397 (a) (1)).

We understand that the Department of Transportation has transmitted to the Congress a draft bill which has been introduced as S. 2357 and referred to your Committee. The Treasury Department recommends enactment of S. 2357 in lieu of further consideration of S. 976.

The Department has been advised by the Office of Management and Budget that there is no objection from the standpoint of the Administration's program to the submission of this report to your Committee.

Sincerely yours,

ROY T. ENGLETT,  
*Acting General Counsel.*

The CHAIRMAN. Now, Senator Hart, you have some remarks I believe you would like to make.

### OPENING STATEMENT BY SENATOR HART

Senator HART. Mr. Chairman, the legislative proposals which the Chairman and I are cosponsoring we believe will create a less costly, more humane automobile compensation system.

The discussions that have preceded the hearings I think have made rather clear the broad outline. I will not repeat it. But it is important to remember that not alone are we talking about a turn to no-fault automobile insurance, but we propose legislation directed at the motor vehicles themselves and their operation. We believe this will reduce accident loss and effect a substantial consumer saving in addition to the saving that would be reenacted by the adoption of no-fault insurance.

Because the basic insurance protection we are proposing would be available to everyone injured in an automobile accident, all accident victims would be assured of recovery of most of their compensable economic loss. Because the protection is on a first-party basis and be-

cause tort liability exposure is limited, the efficiency of the benefit delivery system would be increased markedly.

And because these proposals authorize the setting of priority loss reduction standards, and because they call for inspection of motor vehicles presently operating on our Nation's roads and make provision for the design and construction of an automobile that is more susceptible to direct and prompt and intelligent inspection, there is renewed impetus for reducing the cost of automobile accidents and vehicle operating costs.

Now, there have been many comments on the bills, and, indeed, the House in the last few days concluded 7 or 8 days of hearings. There it was argued, among other things, that the Hart-Magnuson approach is heartless. In House hearings the American Trial Lawyers Association said:

A man is worth more than the cost of putting him back together. He is not simply a machine that must be repaired so that it can be returned to the assembly line. It is morally wrong to say that an innocent victim must suffer the tragedy of a severed leg, a gouged out eye, or years of intractable pain without some compensation for his disability, disfigurement, dismemberment, and loss of ability to enjoy life itself.

That is fine, but the system which the trial lawyers defend fails miserably even at meeting the costs of putting the accident victim back together. Fifty-five percent of those seriously injured or killed in auto accidents receive no benefits from the tort liability insurance system. Ten percent receive no benefits from any system. Under the present system I suggest we treat the broken machines better than we treat the broken people. As for disability and disfigurement, our proposal pays for all hospital and rehabilitation costs and wage replacement to a \$30,000 limit. Additionally, the proposal specifically preserves the right of an auto victim who has suffered catastrophic harm to sue for damages not covered by the bill.

Under the present system, those suffering economic loss of \$25,000 or more receive in tort recoveries only about one-third of their economic loss. Under our proposal, the seriously injured victim would be much better off than he is today.

I hope in these hearings witnesses will address themselves to the issues and avoid the labels. If we get that kind of testimony, maybe we can achieve some constructive reforms.

Thank you, Mr. Chairman.

The CHAIRMAN. Senator Cook.

Senator COOK. Thank you, Mr. Chairman. I have no opening statement.

The CHAIRMAN. Senator Moss.

Senator MOSS. Thank you, Mr. Chairman.

I have no opening statement. I am anxious to get on with the hearings.

The CHAIRMAN. Our first witness is Congressman Córdova from Puerto Rico who will introduce the executive director of the administration for compensation of automobile accidents from Puerto Rico.

Now, the system I understand for the record has been in effect down there about a year, is that right, Congressman?

Mr. CORDOVA. Since January of last year.

The CHAIRMAN. So you have some experience you can tell us? We would be glad to have you introduce your executive director or make such statements as you wish.

**STATEMENT OF HON. JORGE L. CORDOVA, U.S. REPRESENTATIVE  
FROM PUERTO RICO**

Mr. CORDOVA. Thank you, Mr. Chairman.

Mr. Chairman and members of the committee, it is a pleasure and honor for me as the elected representative of the people of Puerto Rico here in Washington to present to you Mr. Frank W. Fournier sitting to my right who is the executive director of the Automobile Accident Compensation Administration of Puerto Rico, an agency which has been recently set up, to administer a limited no-fault compensation system.

Mr. Fournier is a graduate of the University of Puerto Rico, has distinguished himself as an executive in the private insurance field, and was accordingly chosen to head this agency which administers the new system which became operative a year ago January 1.

It is our hope that the experience in Puerto Rico, limited as it is, will nevertheless be of value to this committee in its study of the proposed legislation.

I am indeed in sympathy with no-fault compensation insurance. My experience as a lawyer and as a judge over 30 years has persuaded me of the importance of adopting the concept.

Indeed, as I was telling Mr. Fournier as we were walking over here today, my only regret is that our system in Puerto Rico must necessarily, due to practical considerations, be a limited no-fault compensation plan. I would wish to see it expanded on a broader plane, and I am confident it will be if it continues to be as successful as it apparently has been during its first 17 months of operation.

So, it is a pleasure for me to introduce to the committee Mr. Frank W. Fournier.

The CHAIRMAN. We will be glad to hear from you.

**STATEMENT OF FRANK W. FOURNIER, EXECUTIVE DIRECTOR,  
ADMINISTRATION FOR THE COMPENSATION OF AUTOMOBILE  
ACCIDENTS, SAN JUAN, P.R.**

Mr. FOURNIER. Mr. Chairman and members of the committee, my name is Frank Fournier. I am executive director of the Puerto Rico Accident Compensation Administration. This is a public corporation of the Commonwealth of Puerto Rico that has the responsibility of administering the no-fault social insurance which gives protection to traffic accident victims.

Puerto Rico adopted on June 26, 1968, the no-fault approach for the automobile accident compensation system, thereby becoming the first jurisdiction under the U.S. flag to meet the problem with this new concept.

In every part of the world the accident problem has constantly increased in its magnitude. The effect is so universally experienced and dissatisfaction with the present insurance system so widely voiced, that there is a growing need for reform.

It has become clear to consumers, insurers, and government officials, that the present system of auto liability insurance coverage is becoming unworkable.

Due to long litigation, victims must often wait years to receive compensation, plaintiff attorneys clamor for higher awards, the motorist bewails increasing premiums and the insurance counsel shuns reform. Meanwhile, the fact of proving who is at fault in an accident, with its costly legal tangles and complexities, is creating a crisis in the administration of justice thus exposing the basis of our democracy—the citizen's respect in the law.

The automobile accident victim may have to face years of financial, mental, and physical misery and sometimes is prompted to accept inadequate settlements.

On the other hand, the outcome of an automobile accident case under the fault system is unpredictable. As a result, the number of personal injury losses which remain uncompensated is exceedingly high.

In Puerto Rico, none out of 10 victims were not receiving any sort of compensation. There were two basic reasons for this situation: (1) Negligence gap. (2) Financial responsibility gap.

The first reason we have mentioned. There are several reasons for the second. The financial responsibility or solvency gap was mainly due to the fact that only 35 percent of the vehicles, prior to the enactment of the law, were carrying any sort of insurance. Of the automobile owners' premiums paid to private insurance companies, 57 percent of it was used to pay benefits to the victims. The 43 percent difference was for the costs of acquisition and administration in addition to the profit—not including any investment income.

To better understand this last reason, it is worthwhile mentioning that Puerto Rico for the last two decades has been experiencing a tremendous economic boom. Many jobs have been created and consumers have been able to purchase homes and cars.

The homes are usually located at a distance from the place of work. On the other hand, there is a lack of adequate mass transportation, thus making the car the best means. Having one car for each five persons places us in the sixth place, only after the United States, Canada, England, Australia, and France. Prior to the enactment of our no-fault, our rates were among the highest in the Nation, being the sixth highest premium in the market. It made it difficult for the consumer to afford protection. As a matter of fact, the per capita income of Puerto Rico is lower than the income level of the United States. Right now it is \$1,400.

Many alternatives were considered and rejected after analysis for being unfeasible or unsound, either to private enterprise or to the public. Proposals and acts covering all areas from financial responsibility laws, compulsory insurance and unsatisfied judgment funds to impounding laws, guaranty funds and assigned risk plans were proposed in some form or other, but they were neither acceptable to the parties concerned nor did they completely solve the problem.

Reform was inevitable and Puerto Rico's legislature took action in an imaginative and bold approach. The private sector failed to come with an alternative thus forcing the Government, in its great responsibility to protect their constituents, to come with a positive action to solve the problem—the Automobile Accident Social Protection Act.

Among the problems of the legislature in considering this legislation were those related to costs and financing of the proposal. As the

solvency is guaranteed by the general fund of the Government, actuarial reports that were based on experience and estimates were thoroughly revised. Nevertheless, the risk factor, as well as catastrophic consequences were raised by objectors of the system.

As mentioned, several efforts were made to enact patchwork solutions and financial responsibilities loss, unassigned risk plans, compulsory insurance, et cetera. However, when considering the present act, the change was more drastic and a complete reform from regular and known solutions was considered. The legislators were extremely conscious of this special situation.

The industry opposed the no-fault system as they had opposed workmen's compensation, as they opposed the Social Security Act, as they opposed large deductibles, and as they opposed group life insurance and multiple line insurance. Several persons pressed to adopt a wait-and-see attitude to have the benefit of other jurisdictions or national solutions. However, our situation was ripe for a reform since many victims were not receiving adequate compensation, or no compensation at all, and the premium rates were skyrocketing.

The CHAIRMAN. When you speak of the industry in Puerto Rico—this is just for the information of the record—are they mainly Puerto Rican insurance companies or are they branches of American companies or other companies?

Mr. FOURNIER. They are branches of American companies mostly. We do have two or three other companies.

The CHAIRMAN. Are those Puerto Rican divisions with local people handling the insurance?

Mr. FOURNIER. That is right. General agencies, the same structure as they work in the rest of the States.

The CHAIRMAN. So, down there it would be generally—I am just speaking generally—be safe to say that you were dealing with the same—when we talk of the industry—the same people that we would be dealing with here?

Mr. FOURNIER. Yes, sir. A sector recommended to wait until the Department of Transportation report was released in order to implement a solution.

This same group objected to the fact that the system did not provide compensation for all physical or mental suffering since there was a deductible which was originally recommended to be \$3,500. This figure was reduced to \$1,000 in an apparent effort to compromise.

The partial elimination of the negligence concept was also pointed out to be irritating and possibly damaging to the prevailing values.

At this time, I do not intend to give you details of the Social Protection Act, but to better understand its advantages, let us briefly review its main provisions.

The social protection insurance plan underway in Puerto Rico since January 1, 1970, is intended to avail to all persons using the island's roads a basic plan that provides immediate help to victims of motor vehicle accidents, regardless of the liability principle on the basis of negligence. The plan endeavors to curtail the problem of the victims' helplessness as a result of automobile accidents. Its essential purpose goes beyond the realms of legal resources and juridical analysis: While preserving a legal action against the person responsible for the accident and indemnity under the principle of liability on the basis of

negligence, as per limits fixed by the law, promotes a basic coverage for prompt and effective benefits to a victim, no matter who is at fault.

The social protection plan responds to a social insurance philosophy. It is compulsory and Government administered. It emphasizes socially adequate benefits rather than individual equity and aims at a basic plan of protection for all victims—whether drivers, passengers, or pedestrians—through benefits prescribed by statute. It does not require underwriting, policy issuance, billing, or special collection of premium. The premiums are collected at the time the license plate is renewed.

The CHAIRMAN. Let's clear that up for the record. That is interesting. When the car is a licensed car the owner pays a license fee?

Mr. FOURNIER. Yes, sir.

The CHAIRMAN. But there is added to that the premium for this insurance?

Mr. FOURNIER. Yes, sir.

The CHAIRMAN. Of course, here we would have the problem of 50 States having to collect the amount, but that is a very interesting matter.

Are cars licensed annually?

Mr. FOURNIER. Yes.

Benefits provided include medical and hospital care, compensation for beneficiaries of death victims and funeral expenses, dismemberment and disability. Coverage for medical payments are designed on a blanket unlimited basis.

Medical and hospital services are provided by independent practicing physicians and both private and public hospitals under contract with the agency. It is an approach similar to that used by Blue Shield and Blue Cross plans in the United States. In this way, the principle of freedom of choice of hospitals and the physician is preserved.

Wage loss for disability benefit is reimbursed to the victim on a co-insurance basis estimated taking as a base our income per capita. It discourages malingering; on the other hand, if losses are over the \$1,000 for pain and suffering and \$2,000 for other damages and there is negligence involved, the victim has the legal recourse against the party liable.

Dismemberment benefits run as high as \$5,000. There is a \$500 funeral benefit. Death benefits depend on the age, relationship, and dependency status of the survivors. These benefits might go up to \$15,000. There is no limit per person nor per accident.

The plan excludes property damage liability. The amount payable by the person liable is subject to reduction of any sum paid under the social protection plan or by the \$1,000-\$2,000 limits, whichever is greater.

The social protection plan is financed through payment of \$35 made simultaneously with annual registration of the vehicle.

The CHAIRMAN. In Puerto Rico the premium is \$35 per year?

Mr. FOURNIER. Yes, sir.

All natural persons are entitled to benefits, except for a few exclusions deemed necessary on behalf of the public interest.

These are:

(1) Those whose injuries were caused by an act or omission on their part performed for the purpose of causing damage to their own person.

(2) Those who at the time of the accident were driving a motor vehicle without being legally authorized to do so.

(3) Those who at the time of the accident were participating in automobile races or in speed tests, either as a driver, passenger, spectator, or as official or employee in areas reserved for such activities.

(4) Those whose injuries occurred while committing a criminal act other than a violation to the traffic law.

(5) Those who at the time of the occurrence of the accident were driving their automobiles in a state of drunkenness or under the effect of drugs.

Under this persons are excluded. In the event of death, their dependents will be protected by the law as well as the victims and their dependents.

The fund is controlled by a five-member board appointed by the Governor of Puerto Rico and confirmed by the Senate. One member of the board must be a Cabinet member; another member an expert in the insurance business, and at least two others should represent the public interest. An administration created by the same act, settles claims and carries on all other administrative functions.

To avoid duplication in paying for the social protection plan and private insurance, the insurance commissioner initiated a series of rate reductions to bodily injury and medical coverages when the plan went into effect on January 1, 1970. The reduction affecting bodily injury and medical payments amounted to approximately 30 percent on private passenger cars. But the special feature, as mentioned, of the plan mentioned before leaves the tortfeasor liable to judicial action if economic loss exceeds the limits exempted by the act with privately provided insurance complementing the basic social protection.

The CHAIRMAN. In that case without going into all the exceptions, if the accident occurred and a person was injured by a drunken driver, he would still get the benefits up to a certain amount under the social protection plan, but he could still go into court and haul that drunken driver in and ask for more; is this what you are saying?

Mr. FOURNIER. Yes, sir, exactly. Actually the victim will be protected at any time. The wrongdoer, if he is driving his car under the influence of alcohol, he won't be protected. However, if he dies in the accident, his wife and his kids will be fully protected by the system.

There is also the possibility of recovery in subrogation. The administration has the recovery possibility against a drunken driver and will recover the full amount that is paid to the victims.

The CHAIRMAN. One other thing—you may cover this later on—but a car owner pays the \$35. So, he is under the plan. He has to pay it to get a license.

Mr. FOURNIER. Yes, sir.

The CHAIRMAN. But supposing he thought the compensation plan was not enough, could he still go out and buy additional private insurance?

Mr. FOURNIER. That is right.

The CHAIRMAN. Go ahead.

Mr. FOURNIER. Going through the provisions of the act and complying with our interest in improving the present system, we have answers backed with experience to those who stoutly oppose the no-fault scheme and alleged that:

*1. It would take away vital rights from traffic accident victims*

On the contrary, the social protection plan provides benefits to all victims as a matter of right without regard to legal technicalities.

Promptly and when they are needed encouraging immediate medical care and rehabilitation.

Minimizes human suffering and financial loss.

It leaves the tortfeasor open to judicial action for the amounts in excess of the basic coverage. Therefore, it does not abolish the right of recovery in the courts and it does not completely eliminate the negligence system.

*2. It would shift the burden of responsibility in traffic accidents from the guilty to the innocent*

The Puerto Rican plan broadly spreads the cost of auto injuries over all automobile owners thus placing the economic burden where it belongs. By spreading the burden over all owners it falls lightly on each one rather than heavily on a few. It makes good and bad drivers pay for the cost of their automobile accidents. It transfers the cost of accidents from the victims to all owners. This represents a vast improvement over the present system. Like social security, the plan is designed to help victims of automobile injuries and not as punitive measure to punish bad drivers or the insurance companies, as the negligence system works.

There are more effective procedures for dealing with bad drivers. They can be subjected to penalties, fines, and even imprisonment if their driving violates the criminal law and their driving privileges can be suspended or revoked.

*3. It would saddle car owners who have families with a bigger share of the premium burden than they now bear*

This is a false premise. When the benefits are efficiently provided, it encourages prompt treatment and rehabilitation by utilizing the social insurance technique, eliminating wasteful practices of the present automobile liability insurance and negligence system. Thus costs will be lower, utilizing most of the premium for the benefit of the victim.

Your current system returns in benefits approximately 45 cents out of each premium dollar collected; the social protection plan is about twice as efficient in terms of utilization of premium dollars for the payment of benefits. It makes available returns in benefited of approximately 89 cents out of each premium dollar collected.

The CHAIRMAN. In other words, your experience to date has been that your administrative cost and other features have run about 11 percent of the total?

Mr. FOURNIER. Yes, sir. Taking the investment income into consideration, our expense ratio is close to 11 percent.

The CHAIRMAN. In any event, for every dollar you collect you pay out 89 cents?

Mr. FOURNIER. That is right. For the first year we have the organization expenses and other expenses that we won't be having for the rest of the operation.

So, we believe the figures will be coming down.

The CHAIRMAN. As you move along with experience, you expect to do even better?

Mr. FOURNIER. That is right.

*4. It would undermine traffic safety efforts*

The Social Protection Act dispositions do not stimulate traffic violations. A traffic victim will not qualify for any of the benefits—even though his dependents will be entitled to their corresponding benefits—if at the time of the accident, he was driving but an unlicensed driver was driving under the effects of alcohol or narcotics, or was committing a criminal offense not related to the traffic code or participating in auto races or speed tests. Self-inflicted injuries are also excluded from coverage.

Our experience is a vivid example that the plan does not create irresponsible driving habits, nor increases the number of automobile accidents. The law has specifically provided as a function of the administration, the obligation to investigate all the phases of the problem of automobile accidents including the phases of financial liability and of accident prevention and make the pertinent recommendations to the Governor and to the legislature.

The data collected reflects the true state of affairs of the occurrence with respect to automobile accidents since the wrongful act of the persons insured is not taken into consideration in setting the amount of compensation thus making available meaningful information for accident analysis programs.

Recent compiled statistics indicate that only 90 persons died from auto accidents in 1970, 20 percent less than the previous year, even though we had approximately 76,000 more cars than in 1969, a 25-percent increase.

*5. It eliminated private enterprise by providing State interference or making its existence almost impossible*

Willis T. Rokes while analyzing the effects of the Saskatchewan plan asserts that:

Many opponents of the AAIA believed that the act would drive the automobile insurance agent out of business. On the contrary, the number of agents increased due to the introduction of compulsory insurance in Saskatchewan. This is attributed to the fact that coverage made the public, insurance-conscious and created a greater demand.

In Puerto Rico the market is served by companies licensed in the island and also domestic companies. After the enactment of the plan, the companies have continued to provide insurance coverage over the basic no-fault limits established.

We do not foresee any elimination or curtailment of their existence or any incompatibility with the government plan. On the contrary, advanced reports on premiums written by them reflect increases which definitely disprove the allegation.

Between January 1, 1970, and March 31, 1971, 39,948 victims or their dependents received benefits under the law. Benefit payments of \$8,045,432 have already been paid or reserved.

Furthermore, many lives were saved by the immediate attention received in the nearest facility or hospital and total or longer disability was prevented as the emergency cases were rapidly and effectively taken care of by specialists; \$4,657,418 was reserved or paid to these victims.

Death benefits have been paid or reserved in the amount of \$2,497,230, and, as a result, many widows, children, parents, and other dependents of the victims are presently receiving the protection in weekly

payments amounting to \$50 or a lump sum for the purposes established by law.

As a byproduct of decentralized operations, through nine offices located throughout the island, the funeral expenses provided by law are disbursed within 48 hours after the accidents; \$310,230 was paid for this purpose.

Disability payments are also promptly calculated and disbursed to the injured persons promptly after the 15-day waiting period—\$809,683 was paid to those victims.

Dismemberment benefits, paid in addition to medical expenses and disability payments, are being paid to victims; \$81,100 has been respent for this purpose. The administration is also providing prosthetic devices, wheelchairs, and any other type of medical or rehabilitation equipment, whenever its use is medically recommended.

Statistical information on all accidents, including their socioeconomical impact, consequences, and motivations, are recorded and analyzed by a computerized system. An excellent example of the benefits of our analysis system is the decrease in pedestrian's accidents. During 1969, 45 percent of the victims were pedestrians. In February this percentage jumped to 61 percent. As a result of findings, the reasons for these accidents were analyzed. A pedestrian safety education campaign was started through all means of communication, resulting on the overall reduction in the percentage to 48 percent in March, to 36 percent in April, dropping to 34 percent in May. The overall percentage of pedestrian victims for the year ended in 1970 was 49 percent.

Total income from premiums charged to all vehicle owners amounted to \$21,988,036, operating expenses were \$2,647,340, thus having an expense ratio of 12.04 percent. This is without including the investment income.

Operating expenses included expenses of the nine district offices, and the central office with its seven departments which include medical social workers assigned to cover all the hospitals around the island.

Operation of the fund is on a nonprofit basis and all surpluses and reserves are held by the administration exclusively for the future benefit of motorists and accidents victims. The plan has been widely accepted by the citizens as a socially urgent program which has proved its feasibility in fulfilling the needs of the automobile accidents victims.

It is worthwhile mentioning that expense ratios for property and casualty stock companies were reported by A. M. Best Co. at 30.3 percent for 1969 and the mutuals expenses were 24.1 percent which compared to our 12 percent are extremely high.

The Government Employees Insurance Co. of Washington, D.C., had an expense ratio of only 12.4 percent.

Many jurisdictions are looking up our social protection plan even though differences of legal procedures, political attitudes and economic developments are present. The automobile insurance problems are not inherently different from those commonly found in the States.

Right now there are several improvements we have submitted to our legislature:

(a) Benefits for work loss to the housewife to cover in part for expenses reasonably incurred for service in lieu of hiring household help to do her work.

(b) Extending coverage for dismemberment benefits to other extremities.

(c) Provision for special procedures for the protection of minors as beneficiaries of the victim.

(d) Coordinating several provisions to prorate annual contribution according to certain requirements of the vehicle and transit law.

Puerto Rico has established that it is fully capable of making an orderly, efficient and complete transition from a fault system to a partial no-fault system, until now our experiences have gone beyond our expectations but from now on, our experiences might help our way into elaborating future expectations.

The Puerto Rican no-fault system should not be regarded as a solution designed to fit only a unique socioeconomic structure or situation. Although the plan was designed to fit Puerto Rican problems its basic philosophy may be readily adapted to any other situation including those existing in other jurisdictions of the United States. This is so, since the existing automobile insurance problems in Puerto Rico are not substantially different from those found in the mainland. Whatever differences do exist they have to deal primarily with the magnitude and not with the nature of the problem.

Which trend to follow?

If the no-fault plan is to be adopted by any jurisdiction its success depends mainly on the positive action of the government.

First, the problem should be faced recognizing the failure of the negligence system in solving the plight of the victims of automobile accidents. As the insurance companies claim, it produces serious underwriting losses.

In the second place, the American automobile insurance industry should be required to offer a satisfactory alternative based on a no-fault system which proves their intentions of working hand-in-hand with government in approaching and solving the present situation.

Right now there are close to 50 proposals, and there are a few of the major companies that are endorsing and even writing some policies without any amendment of the State laws.

A democratic society of which the insurance industries and State governments are the pillars of the compensation system, cannot be blind to its responsibilities. We cannot let the public lose faith in their institutions.

Third, if the automobile insurance industry fails to provide a plan that fulfills government expectations for a fair plan for motorists and persons who might be injured as a result of a motor vehicle accident, it is time for the adoption of a governmental no-fault social protection plan.

It is clear therefore, that whatever action is taken to meet the outcry of society for reform of the compensation system for automobile accident victims, it will have to be urgent, and if any alternative is selected, it will have to be a no-fault system.

Thank you.

The CHAIRMAN. Thank you for that excellent review of your experience with the system for the past year.

Now I have just a couple of questions. I was going to ask you; has no-fault led to more accidents because of irresponsible driving? But you covered that in your statement, but I would like to state again that

the accident rate has fallen since the no-fault plan has gone into effect. Those are the figures you have given us in your statement.

Mr. FOURNIER. Yes.

The CHAIRMAN. I think we cannot stress that too much, because one of the potent arguments against no-fault is that it would create irresponsible drivers. Of course, you have eliminated some of the irresponsible drivers, but I think I read somewhere, I will correct the record if I am incorrect, that at least from 40 to 50 percent of our accidents have been caused by drunken drivers.

Mr. Congressman, were Puerto Rican courts clogged down like they are here with auto cases?

Mr. CORDOVA. That is correct.

The CHAIRMAN. Has this plan helped that considerably?

Mr. CORDOVA. I could not answer that question. Our courts were clogged, yes, but not to the degree that they have been clogged in the States because we do not have jury trial in civil cases in Puerto Rico except in the U.S. District Court for Puerto Rico. That is the only court which has the jury trials. A trial before a judge is more expeditious.

The CHAIRMAN. Is it generally thought that the court congestion has been relieved?

Mr. FOURNIER. Yes. We have a 1-year expiration of court claims. We did make a survey of the major insurance companies doing business, and there was a reduction of approximately 10 percent, but we will be able to get exact figures within a year. Actually it will be 2 years; in 2 years we will have figures—

The CHAIRMAN. Because a lot of cases were pending?

Mr. FOURNIER. That is right.

The CHAIRMAN. Another factor, and I do not say this in any derogatory way—maybe it is good there are not as many lawyers in Puerto Rico per capita as there are around here.

Mr. CORDOVA. There may well be. I have never made the comparison. But there are a lot of us. I will supply the figures.

(The information follows:)

The number of lawyers, according to the Supreme Court is 3,813 for 2.7 million inhabitants or one lawyer for each 708 persons.

The CHAIRMAN. Senator Hart.

Senator HART. Gentlemen, thank you for the helpful testimony.

Thirty-five dollars annually is the premium. You say in the first year of your operation you have returned 89 cents of every dollar that you have collected.

Mr. FOURNIER. Let me clarify it. We did not return the full amount, but we do have the excesses and surpluses remaining to be returned to the victims, either as increasing the benefits or either by decreasing the premium. However, we have selected to increase the benefits rather than reduce the premium, because the system has some areas which do not have enough compensation or no compensation at all that we need to cover first before reducing the premium.

Senator HART. I understand that there would be no moneys retained for profit, it being a nonprofit Government activity, and you told us some of the costs were startup costs incurred this year which would not be repeated in the years ahead. But again 11 cents was retained I guess is what I am trying to find out?

Mr. FOURNIER. These are operating expenses.

Senator HART. Are you saying that not all of the 89 cents remaining was paid out in benefits, that some was retained in addition to the 11 cents?

Mr. FOURNIER. These are reserves. However, the moneys collected and the moneys paid, these have to be returned either in original benefits or as an adjustment to premiums paid by the owners.

Senator HART. Your testimony advises us that before this public compensation plan went into effect 57 percent of the premiums were returned to policyholders by the private insurance carriers.

Mr. FOURNIER. That is right.

Senator HART. That loss ratio is substantially higher than the 45 to 50 percent estimates that we get from the operations in this country. Do you know whether that 57-percent figure included benefits for lawyers, legal defense?

Mr. FOURNIER. Actually, I cannot tell for sure.

Senator HART. Mr. Chairman, if we might have that answer after you check for the record.

Mr. FOURNIER. Yes. To be completely truthful, we need to check on those figures. Offhand, without getting into the details, my thinking is, it was not considered. It went directly to the victims. However, to confirm that we will supply it.

Senator HART. We will receive the answer for the record.

(The following information was subsequently received for the record:)

The 57% loss ratio includes the payments for legal defense to plaintiffs' attorneys, however, defendants' (insurance companies) costs are included in the administration costs.

Senator HART. You have told us in addition to the insurance provided by the Puerto Rican auto accident compensation plan a person can buy private insurance to protect himself from tort liability over the set figures. Do you know what the total premium is now when you figure both the \$35 for the Government administration of the plan and by the private industry supplement for coverage?

Mr. FOURNIER. Well, we have to take into consideration the classification of the risk and also the limits of the policy. Let's take a person that uses a car to drive from home to work and for pleasure and has a 5-10 basic protection. In a private insurance company the premium paid will be close to \$97 per year. However, the private insurance company policy before did not protect the driver and other persons living in the same household. By having the \$35 Government premium they are protected. All the victims, including the passengers, the driver and the pedestrians, all the persons living in that household without limit per accident per person. We have had to pay close to \$50,000 in medical expenses in some cases. If we have five persons injured in an automobile accident we have to pay \$50,000 for each one of them. There is no limit in connection with the medical expenses. So the total protection is increased. At the same time more persons are protected than before having the private insurance company policy.

(The following information was subsequently received for the record:)

For correcting the example given in connection with the actual effects of savings to consumer after Law 138 was adopted, following is a schedule of classifica-

tions and rates. The closer classification is 1C<sup>1</sup> was paying \$98.00 per year for 5/10 bodily injury and 2,000 medical payments, after the Law was passed he paid \$68.00 for a \$30.00 savings. The same owner had to pay \$35 to Government No-Fault, however, as mentioned now the name insured as well as the persons living in the same household will be protected without limits per person in medical payments, nor per accident in the rest of the coverages.

RATES FOR BODILY INJURY WITH LIMITS 5/10 PLUS \$2,000 MEDICAL PAYMENTS FOR THE YEARS 1968 AND 1970  
BY CLASSIFICATIONS

RULE 4. PRIVATE PASSENGER AUTOMOBILE CLASSIFICATIONS

This Rule is replaced in its entirety by the following:

LIABILITY COVERAGES AND COLLISION ONLY

The provisions of this Rule apply separately to premiums for Liability and Collision Insurance.

(a) Private passenger automobiles owned by an individual or by husband and wife resident in the same household shall be classified as follows: (Refer to Section E of this Rule for the definitions of terms used in this section).

1A. There is no male operator under 25 years of age, the automobile is not used for business nor is it driven to or from work.<sup>1</sup>

1B. There is no male operator under 25 years of age, the automobile is not used for business but it is driven to or from work<sup>2</sup> a distance of less than ten road miles one way.

1C. There is no male operator under 25 years of age, the automobile is not used for business but it is driven to or from work<sup>2</sup> a distance of ten or more road miles one way.

2A. There are one or more male operators under 25 years of age and each such male operator is either (1) married or (2) not an owner or principal operator of the automobile.

2C. There is an unmarried male operator under 25 years of age who is an owner or principal operator of the automobile.

Copyright 1969, Insurance Rating Board.

Senator HARR. Now, to give us some measure of that, and I assume we would have to ask you to provide the figures for the record, can you let us know what the total premium dollars paid before the institution of the Puerto Rican plan were? In other words, what was the premium volume done by the private insurer before the plan and what is the total in the first year of the plan including private claims paid to supplement the plan? I would like to have those two figures.

<sup>1</sup> There is no male operator under 25 years of age, the automobile is not used for business but it is driven to or from work a distance of ten or more road miles one way.

<sup>2</sup> An automobile used for driving to or from school shall be considered as used for driving to or from work.

Mr. FOURNIER. The first is close to \$5 million that was returned from the private insurance companies to their policyholders.

Senator HART. No, what I think would be helpful to get is the premium volume, total insurance premium paid, not paid out but paid by the consumer to the companies for private insurance in the year prior to the institution of the Puerto Rican plan and now, the total purchased from private insurers plus the total of the \$35 per licensee under the State plan.

Mr. FOURNIER. Before, only 35 percent of the owners were having any sort of insurance. So the complete universe was not paying the premium. Right now the consumers pay close to \$19 million for the Government insurance, and I guess that for the last year the companies were required to submit figures as of March 31, and the complete report is not completed yet. However, it is close to \$12 million that the consumers pay to private insurance companies.

Senator HART. Then for the record you can give us the total premium dollar that was represented in the insurance purchased by the 35 percent who did purchase insurance before the introduction of the Puerto Rico plan?

(The following information was subsequently received for the record:)

Before the introduction of the Government Plan consumers purchased the following (earned premiums): 1968 \$13,077,695; 1969 \$15,034,728; 1970 \$15,137,244.

The 1970 figures were not increased over the previous years due to the fact the private carriers had to adjust the premiums by approximately 30%, which amounted to approximately 4.5 millions as a result of the No-Fault Act. This figure also proves the contentions the number of insureds increased as a direct result of more consciousness of the need of excess insurance.

Mr. FOURNIER. Before the introduction, it was close to \$16 million. The actual figures I will have to check. These reports will be available from the insurance commissioner, but the problem with last year is the companies are required to submit reports 6 months after the termination of the fiscal period with some companies requesting extensions of time for submitting their reports.

Senator HART. An additional figure you might provide for the record, once the filing by the private insurers are available, and it would test the overall efficiency of your combined public and private system, how much of the total premiums collected, both by the Puerto Rican plan and the private insurers, is being returned to the motoring public. You can let us have that when you find it.

Mr. FOURNIER. I will, gladly.

(The following information was subsequently received for the record:)

Premiums earned in 1970 by private insurance carriers amounted to approximately 15,658,124, having incurred losses of 8,859,514 for a loss ratio of 56.6%. On the other hand, the No-Fault System collected for a year protection 16,356,780 (earned) and reserved for payment 14,334,975 for a future loss ratio of 87.6%. This loss ratio doesn't include the investment income. We have to point out that the 14,334,975 includes the reserve for payments and payments made also the excess or surplus which according to Section 14 of the Law, limits its use for the payment of claims.

In connection with the total amounts (private and government no-fault) returned to the motoring public, the figures for 1970 are the following:

**Earned premiums:**

Private .....	\$15, 658, 124
Government .....	16, 356, 780
<b>Total premiums paid by motorists.....</b>	<b>32, 014, 904</b>

**Incurred losses:**

Private .....	8, 859, 514
Government .....	14, 334, 975
<b>Total .....</b>	<b>23, 184, 489</b>

Loss ratio: total losses divided by total earned premiums equals 72%.

Thus the combined returns to the public amounts to 72%.

The CHAIRMAN. We will keep this record open in case you want to add some things. We will keep it open for 30 days because we have several days' hearings.

Senator HART. That is all for me, Mr. Chairman. Thank you.

The CHAIRMAN. Senator Moss.

Senator Moss. Thank you, Mr. Chairman. Thank you, Mr. Fournier, for your testimony. It certainly is helpful. It is fortunate for us that we have what we might call a small pilot project going in Puerto Rico. This helps us in consideration of the legislation before us and gives us guidelines as to what we might expect. Do I understand that this no-fault plan just covers injuries arising from accidents?

Mr. FOURNIER. Yes, sir, bodily injuries.

Senator Moss. Has there been any consideration given to including property damage on the automobiles on a no-fault basis?

Mr. FOURNIER. We have received requests from the persons, especially those paying the collision and property damage premiums in order not to pay two premiums and getting a more efficient system, getting collision protection for each and every owner. However, the private companies are fulfilling the needs of the consumers, and although the prices and the costs have increased lately, there is some efficiency and there is not such a pressure as we had before with the victims. The machines can just be junked. You cannot just put the victim away. You have to come to help the victims and the personal injuries.

Answering your question, the direct answer is we are not presently considering at the present time to adopt the property damage or the collision protection for the automobile owner.

Senator Moss. Do you think if it were included, this might increase the likelihood of building safer and stronger cars since there is a recovery established by a regular no-fault system?

Mr. FOURNIER. It might, yes. It might well push the industry to manufacture better cars and also—you know, we do not yet have the figures; however, we are now collecting excellent data, including all the years on the makes of cars and all the details in connection with the accidents. We can point out which are the cars subject to fatal injuries and more serious injuries, and there are other results that can be obtained by analysis.

Senator Moss. The figures have been supplied to me on premiums paid and benefits paid in the field of automobile insurance in 1970. I wanted you to review my arithmetic to see if it is reasonable to draw a conclusion from these figures based on your experience in Puerto Rico.

The information I have is that in 1970 \$14 billion was paid in automobile insurance premiums and that of that amount there was \$7 billion paid to the victims who received either injuries or damage—the damage is calculated a little bit differently than yours, but the overhead cost for administering was \$5.8 billion and lawyers received in fees \$1.2 billion in that period of time. At the same time, it was estimated that there was a loss of between \$10 and \$11 billion by automobile owners or victims of accidents which means there was a shortfall there of payback of between \$3 and \$4 billion. If this system that you have in Puerto Rico had been in effect, the \$5.8 billion overhead would have been reduced to \$1.4 billion, roughly 10 percent of the \$14 billion that were paid in, and, of course, the lawyers' compensation would have been eliminated under a no-fault system because there would not have been payouts for attorneys. That would have increased the amount available by \$5.6 billion, giving a total of \$12.6 billion available to pay off the \$10 to \$11 billion in damage suffered. That would have made it come out even so people would have been restored under the no-fault circumstance. Based on your experience, would that be a reasonable conclusion?

Mr. FOURNIER. It is an excellent analysis and an excellent comparison with the actual results, even though we have not completely eliminated the lawyers' fees. We do have an adjustment. We have a 10-percent figure in the basic protection which the lawyers are able to get. When we have denied the victim, the procedures are reviewed, and when there is a payment authorized to the victim the lawyers will get 10 percent in addition to what they might get through a tort case. However, the comparison you have made I think would be truthful for any system applicable, because each is based—any elements that could be eliminated from the system in terms of lawyers or procedures could be cutting costs to the consumers in the overall payment of the premiums.

Senator MOSS. At least up to this limit of the recovery where the no-fault applies this logic would be correct?

Mr. FOURNIER. That is correct.

Senator MOSS. Tort suits instituted when the damage is beyond the limit still is subject to attorneys' fees and some other costs perhaps, but at least within the limits of what we set for no-fault—

Mr. FOURNIER. Eighty percent of the losses in our system—it could be a difference in other States—fall within the tort suit exclusion limit, \$3,000—\$2,000—\$1,000. So we are cutting the most frequent claims which were the most costly ones, the ones that the company had to pay the nuisance values in order to get rid of a case, in order not to go to court, in order not to pay for an investigation, in order not to pay for additional administration and reviewing the cases in each district office and at the home office.

Senator MOSS. I noted one statement you made in your presentation that I thought was quite interesting. You said: "The data collected reflects the true state of affairs of the occurrence with respect to automobile accidents since the wrongful act of the person insured is not taken into consideration in setting the amount of compensation." What you are really saying is you probably get more truthful answers from

those involved because they are not trying to coverup fault when they answer the questions.

Mr. FOURNIER. That is right.

Senator Moss. Being an old prosecutor myself I have great sympathy for that. I know how worrying about the fault element, how difficult it is for people to give an accurate reconstruction of the event when an accident is being examined. They are always trying to cover the fault part where they might be involved and might be charged with contributory negligence.

Mr. FOURNIER. You are completely right.

Senator Moss. Thank you. I think your testimony has been most enlightening, and we are fortunate indeed that Puerto Rico has stepped off and is trying to find some answers that we are now groping for here on a national level. Thank you.

Mr. FOURNIER. Thank you very much.

The CHAIRMAN. Supposing that you had underestimated the amount of accidents or you had a rash of accidents more than usual and the fund would not cover it, do you have any plans for a reserve fund in this?

Mr. FOURNIER. I can explain to you——

The CHAIRMAN. Or would you have to go to the legislature to be reimbursed?

Mr. FOURNIER. No. Automatically we would be reimbursed by the general funds of the Commonwealth of Puerto Rico.

The CHAIRMAN. Of course, it would take an unusual set of circumstances before the legislature would raise the \$35?

Mr. FOURNIER. No; the premium is controlled by the insurance commissioner as he controls the private insurance companies.

The CHAIRMAN. He has a flexible way. I suppose he gages it by actuarial figures?

Mr. FOURNIER. The actuarial reports have to be submitted on a yearly basis just like the independent insurance bureaus.

The CHAIRMAN. But the insurance commissioner's estimate of \$35 has proven during the operation to be pretty well correct; the estimate?

Mr. FOURNIER. That is correct.

The CHAIRMAN. It is 12:30 p.m., and we will have to recess the committee until 2:15 p.m., and we thank you both for coming.

(Whereupon at 12:30 p.m., the hearing was recessed, to reconvene at 2:15 p.m., the same day.)

#### AFTERNOON SESSION

Senator HART (presiding). The committee will resume.

The chairman, Senator Magnuson, will join us if his schedule permits.

The next two witnesses may wish to testify jointly. I don't know if that is the right way to put it. In any event, it has been suggested that you both come up and proceed as you think best serves your purpose. I know we have received statements from Robert J. Klein, economics editor of Consumers Union, but not from Mrs. Erma Angervine, who is the executive director of the Consumer Federation of America.

You may proceed as you would like.

**STATEMENT OF ROBERT J. KLEIN, ECONOMICS EDITOR, CONSUMERS UNION, MOUNT VERNON, N.Y.**

Mr. KLEIN. Thank you, Mr. Chairman.

My name is Robert J. Klein. I am economics editor of *Consumer Reports*, the magazine of Consumers Union. I am pleased to appear today in response to this committee's invitation to testify on the need for reform of the Nation's automobile insurance system.

An undercurrent of public discontent with automobile insurance became evident as early as 1961, when Consumers Union began its first comprehensive study of this consumer service. The next year we published a series of reports. They told how to buy insurance, which of the larger companies appeared likely to give the best service, and what seemed fundamentally wrong with the kind of insurance consumers were forced to buy.

I would like to read you a brief passage from that series. We said:

Either automobile liability insurance or negligence law by itself might be defended as reasonable, but today's combination of the two produces results which are so unjust, so capricious, and so wasteful of both the policyholders' and the accident victims' money that most laymen find it hard to believe the facts when they are first presented.

Nine years later the Department of Transportation put the finishing touch on that indictment, and I quote:

The existing system ill-serves the accident victim, the insuring public and society. It is inefficient, overly costly, incomplete and slow. It allocates benefits poorly, discourages rehabilitation and overburdens the courts and the legal system. Both on the record of its performance and on the logic of its operations, it does little, if anything, to minimize crash losses.

One of the less discussed evils brought about by the tort liability system of compensating highway injury victims is that it corrupts the practice of the law itself. I, myself, am not competent to discuss this condition, but in a forthcoming book called "The Injury Industry," law professor Jeffrey O'Connell, the coauthor of the Keeton-O'Connell Plan, devotes a chapter to the inevitability of the ambulance chaser who against the canon of his profession seeks out accident victims or has them sought out for him by professional "finders."

Well, in 1967, Consumers Union cosponsored a conference on automobile insurance claims at the University of Illinois Law School. In 1968 we endorsed the Keeton-O'Connell basic protection plan, the pioneering no-fault plan. In 1970 we published the results of a survey of the experiences with automobile insurance of some 230,000 of our members. Again the findings led us to advocate no-fault insurance. Later in the year we cosponsored another conference on insurance reform, this one in collaboration with the University of Minnesota. Colston E. Warne, our president, served as chairman of the Consumer Advisory Committee of the Department of Transportation's Auto Insurance and Compensation Study. As a result of this decade of exposure to the problems of automobile insurance, perhaps we can speak about them with some authority from the consumer's point of view.

From that point of view, the situation has become absurd. Consumers find themselves ordered or compelled as car owners to buy

automobile liability insurance from private companies, yet those companies refuse to sell insurance to many of us. According to the DOT studies, 14 percent of American motorists have had their insurance canceled. And that figure is no doubt obsolete. Consumers Union has lately been flooded with complaints from people whose auto insurance companies have canceled or refused to renew their policies. In the past year some of the most prestigious insurers, including Nationwide Mutual, Liberty Mutual, and State Farm Mutual, have mercilessly reviewed their underwriting standards and, as a result, have rejected many thousands of policyholders. Many people tell us they are being canceled by companies they have done business with for 10 or 20 years.

I would like to add that there is a concomitant ill that goes with this threat of cancellation—the increase in payment if one files an accident claim. As a result many people do not file accident claims, or they settle their own claims rather than risk their insurance company's settling them. In our survey of 230,000 people, 6 percent said that they had paid their own liability claim rather than let the insurance company handle the claim. What this amounts to is a kind of hidden deductible which the insurance policyholder doesn't benefit from in his premium. That is, he doesn't make any savings in his premium but he simply accepts the liability anyway.

Well, it was intolerable that, in earlier years, insurance companies were found to be "red lining" poor urban areas, abandoning primarily the low-income, minority-group customer. Now this shedding of risks has made itself felt across the demographic board. Large numbers of middle-class, suburban, white motorists—middle America, if you like—have been denied coverage in the regular market and have been relegated to assigned-risk pools. If politicians haven't read the handwriting on the wall, insurance agents surely have. Richard E. Peck, president of the Independent Mutual Agents of Connecticut, warned his fellow agents in March, "I think all hell is about to break loose." According to the National Underwriter, he told an agents' meeting:

We—and the public—need better statutes to guard against policy cancellations and agency terminations. We'd better get them or public wrath such as we've never known is going to be unleashed against us. We're going to hear about no-fault automobile insurance until we hear it in our sleep. We'd better be ready to either propose or back the best course of action . . . —because if we don't, somebody is going to shove something down our throats that we don't like the taste of at all.

In the April issue of Consumer Reports we have described 14 goals for automobile insurance reform. You will find them in our exhibit A. I will be glad to read them aloud if you like.

Senator HART. No, we will include them in the record at the conclusion of your testimony. I read that April issue, and I think I have already put that into the Congressional Record.

Mr. KLEIN. Fine.

We advocate in those 14 points a thoroughgoing Federal no-fault system. One of our goals is a noncancelable, guaranteed renewable automobile insurance policy—a policy that everyone in the insurance business must sell to all comers, so long as they are licensed to drive or eligible to register a car and so long as they pay the premiums. It is not the responsibility of insurance companies to decide who shall

U.C. BERKELEY LIBRARY

and who shall not drive. That should be the responsibility of the State.

Does it sound outlandish and impractical to require insurers to sell policies to all eligible customers? Then consider the law in the Federal Republic of Germany, as described in the DOT's report, "Comparative Studies in Automobile Accident Compensation":

Automobile insurers in West Germany are under a statutory obligation to accept applications for liability insurance, and the regulatory authorities see to it that insurers comply with that duty. While an application may be rejected for certain limited reasons, there is no danger that an applicant who is ready to pay the applicable premium will be lawfully rejected by each of the more than 100 insurers writing automobile insurance in Germany. This system not only eliminates the need for any supplementary facility like the American "assigned risk plans," it also prevents excessive "skimming." All companies get about equal shares of desirable and undesirable risks.

As you will note in our exhibit, only one major automobile insurance reform plan would require automobile insurance companies to deal with everyone. It is the Hart-Magnuson plan, now before this committee for consideration. Unfortunately, the concurrent resolution proposed by the Department of Transportation does not recommend this reform. In our opinion, failure to deal directly with the problem of making insurance fully accessible to every motorist is a major shortcoming of the administration's proposal.

Some will say that a first-party, no-fault automobile insurance policy of the kind being proposed would automatically solve the cancellation problem. That assertion flies in the face of recent experience. Try to buy burglary insurance in Manhattan. Try to buy flood insurance in Mobile. CU's mail also hints at the beginning of a wave of cancellations of homeowner's insurance policies. All these are first-party no-fault coverages.

The fact is, insurance companies have drifted away from the very foundations on which insurance is built—the broadest possible spreading of the risk. One man who worries about this trend is George K. Bernstein, Federal Insurance Administrator. As he said to the Association of the bar of the city of New York last month:

Perhaps the most basic principle of insurance—upon which it grew, but which in recent years has been in large measure abandoned—is the need to spread the risk. Effectively implemented, the principle of insurance requires the placement of a large number of risks in a single category in order for classification and territorial rate-making to produce sound results. Industry survival is unlikely if it continues to pursue an abortive law of small numbers . . . In the fire and extended coverage area, this form of enforced isolation has contributed to the segregation, in some areas, of over one-third of the insureds in [assigned risk pools].

No-fault insurance, while not by itself the answer to the cancellation problem, is certainly the answer to the scandalous social problem of the uncompensated or undercompensated accident victim. You have all read the hardship statistics in the DOT studies: 55 percent of seriously injured victims receive no compensation from automobile liability insurance. Of injured people who do receive liability insurance benefits, those whose losses are less than \$500 collect an average of four times their losses. On the other hand, people with more than \$25,000 of out-of-pocket medical expenses and lost wages average less than 15 percent recovery from liability coverage. When serious injury occurs, 5 percent of the stricken households have to send other members of the family

to work; 3 percent have to move to cheaper housing; 20 percent have to take money from savings or the sale of property; 12 percent miss debt payments.

Senator Hart, you have made those figures much more vivid by setting out the plight of those whose losses were \$5,000 or more. Their hardship percentages, of course, are much higher than those that I have read.

To put some flesh and blood on those figures, we would like to tell you of an actual case of uncompensated loss and its consequences. We cannot disclose the victim's name because his claim may soon be in litigation, but his plight illustrates that of thousands of highway victims every year.

The man, whom we shall call Mr. Johnson, operated a diner in a small town. A few years ago he needed an operation on his knee. It was going to keep him off his feet for a prolonged period, and so he temporarily leased his diner. A couple of years after the operation, Mr. Johnson's doctor said he would soon be able to put aside his crutches and resume his livelihood. Then came the accident. A youthful driver, who Mr. Johnson claims was driving in the wrong lane, hit his car head-on. His knee hit the dashboard. The next day the surgeon gave him the bad news. The accident had totally undone the operation, and Mr. Johnson will have to wear a knee brace and use a crutch for the rest of his life. He will never be able to resume operation of his diner.

The youthful driver's insurance company accepted liability and paid almost \$500 to fix Mr. Johnson's car. In compensation for his medical expenses and lost income, Mr. Johnson was offered \$1,000. Furthermore, the adjuster warned him, a witness had been located who would testify that he was not driving entirely in his own lane when the accident occurred. Mr. Johnson has hired a lawyer and will soon take up the tortuous course of pressing suit. At most he can hope to win only \$10,000, the maximum liability coverage in the youthful driver's assigned risk policy. If he is lucky enough to collect the \$10,000, he can expect to pay out at least \$3,000 to his lawyer for legal fees and court costs.

Mr. Johnson's loss will be far greater than \$7,000. Medical bills thus far are \$472. Lost earnings—money he would have earned, after taxes, behind the counter of his diner—amount to at least \$10,000 per year, based on his past earnings. Mr. Johnson is 62 years old now, and he had planned to keep working until he was 70. But even if he retired at 65, his wage loss would reach \$30,000.

The Johnsons can illafford their loss. Already they find it impossible to continue paying their daughter's college tuition. She has gone into debt to stay in school. The Johnsons are living on social security disability income and the money they had been saving for retirement. That money, they told us, is dwindling rapidly. The future for Mr. and Mrs. Johnson looks bleak indeed.

Under a no-fault system such as the Rockefeller-Stewart plan, the American Insurance plan, the Hart-Magnuson plan, or the DOT plan, the Johnsons would have been able to weather this crisis without financial hardship. We think there are millions like them.

Senator HART. Mr. Klein, the case you are describing can be matched many times. Here you have got a judgmentproof young

driver of the other vehicle with only the minimum \$10,000 insurance which sets the ceiling on the outside recovery possibility for Mr. Johnson. As you say, Mr. Johnson would be much better off under the Hart-Magnuson and some of these other plans.

I don't want to burden the Hart-Magnuson proposal beyond its ability to be carried through the Congress, but let's assume Mr. Johnson was a younger man and this set of circumstances applied, even under the bill that the chairman and I have introduced he would be compensated only for about up to \$30,000—instead of being 62, if he was 42, that raises a question clearly as to whether there should be consideration given to raising the wage replacing limits in these plans. I know how you would feel, as I think most people would, that it would be desirable to put Mr. Johnson back as far as we can for the maintenance of his family, but how much more do you think it would cost policyholders generally if we did talk about increasing that \$30,000?

Mr. KLEIN. I should say this is a large coincidence that Mr. Johnson's letter came to my attention when this invitation to testify also reached me. It was just coincidence that his loss was \$30,000 which is also the ceiling in your plan.

As you know, S. 945 provides a wage replacement system for as long as necessary up to a wage level which the Bureau of Labor Statistics would say is adequate to maintaining yourselves in whatever community you live in. I think it is somewhere around \$12,000 a year in most communities, depending on the city, of course, and your \$1,000 a month figure is right on the nose. We would rather see a bill not set that figure of \$1,000 but match it to a Bureau of Labor Statistics figure. As to how much it costs, Consumers Union isn't an actuarial source, we haven't been able to cost these 14 points ourselves, but when you try to use existing plans which have been actuarialized, the New York State plan, which apparently had good actuarial underpinnings, would replace wages indefinitely, not up to \$1,000 a month or any particular limit at all but up to the amount lost.

So really if that can be done with a saving of premium, the objective that we set forth ought to be able to deliver without any great increase in premiums, with a saving in premium over the present system, too. We all realize, I think, that wage loss is the biggest expense in the insurance situation, and, as we point out, the actuary for the Keeton-O'Connell plan set a limit of \$10,000, which he thought was necessary in order to bring savings to the public. Nobody knows the answer to your question.

In Massachusetts, the situation suggests that the saving is going to be much larger than anybody dreams of.

Senator HART. Although it was not intentional, I have discovered that I have interrupted you at a point where the Senate is engaged in a rollcall vote. So, I will have to recess for about 10 minutes.

(Short recess.)

Senator HART. Given what happened when I interrupted you, I won't interrupt again, but I agree with you it is a question as to which there is no precise answer. The elements that you described are the ones that I think have to be cranked into the answer.

Mr. KLEIN. Yes, it is possible that a plan will have to be worked in step by step.

To continue, of the many important details of the reform plans before this committee, we will dwell on only a few today.

The first is the question of whether, in a no-fault system, automobile insurance coverage should take precedence over other insurance that might cover the same loss. We fully agree with the objective of coordinating benefits to eliminate duplicate coverage. Many people, for example, are insured through their employers for some portion of their hospital and doctor bills and, in some instances, for major medical expenses. Their insurance is written in group plans, and, in the case of Blue Cross-Blue Shield and some other plans, is produced on a nonprofit basis. Of \$1 paid into Blue Cross, better than 95 cents is returned in benefits. We heard today that the ratio is 89 cents on a dollar in Puerto Rico, and I am sure when their startup costs are spread over a number of years that that will go up to 95 cents too. Of \$1 paid into commercial group health and accident plans, more than 80 cents is returned in benefits.

The percentage of premium returned as benefits is the chief measure of efficiency of an insurance plan. How does automobile insurance stack up? The liability insurance which so many of us want to be rid of is grossly inefficient. According to the DOT, it returns only 50 cents on the dollar. According to other studies, it returns less than 45 cents on the dollar. That means consumers must pay more than \$2.20 in premium to get \$1 of benefit.

Furthermore, most of that 45 cents does not pay for uncompensated economic losses. It pays instead for losses already covered by other insurance and for unmeasurable losses under the catch-all heading of pain and suffering. Hence, we'll be well rid of liability insurance.

But what of the efficiency of other kinds of automobile insurance? What of the first-party coverages for collision damage, fire, theft, and medical payments? How efficient are they? Far less so than Blue Cross and commercial group coverages. First-party car insurance returns only about 65 or 70 cents of the premium dollar.

Keep in mind that consumers will be required to buy no-fault coverage under all the plans being studied. We have no quarrel with that. But we do quarrel with a system that would make us buy relatively inefficient and therefore relatively high-priced automobile-medical coverage in place of our present lower priced group coverages. That, we regret to say, is what the DOT plan would do by its insistence on making automobile insurance the primary coverage for injury and wage loss. It is true that the DOT plan gestures toward inviting the group hospital and medical plans to compete as automobile-injury insurers. But we fear that, with Blue Cross rate increases meeting heightened public resistance, some Blue Cross plans might welcome the chance to provide the illusion of rate stability by shedding coverage of auto accident victims.

The no-fault policyholder like the liability insurance policyholder will see rising medical costs reflected in the price of his insurance. How to control medical and hospital costs is beyond the scope of this hearing, but it is a problem that Congress must face as it explores various national health insurance proposals.

In the long run the social and health insurance plans are part and parcel of what we are talking about here in the way of first-party automobile injury coverage, and in our 14 points, Senator, we try to fash-

U.C. BERKELEY LIBRARY

ion a plan which would work in. We assume the time is coming when hospital and medical bills will be covered for all Americans through some sort of insurance or prepaid or national health service plan. Of course, that will do a lot to solve the automobile insurance cost problem.

Consumers Union's goal calls for auto insurance to cover only what less-costly insurance plans do not cover. In a compulsory insurance situation, that is the only fair way. If auto insurers can develop highly efficient, price-competitive group coverages, fine. If not, they should cover only the excess losses.

Even in the best of markets, one of the consumer's worst problems with buying insurance is the hopelessly complex matter of getting good value for his money. The insurance companies have fragmented the population into so many price rating categories that, as the Federal Insurance Administrator has pointed out, there are more than 7 million potential slots into which an insured person might fall. Imagine, 7 million different prices for the same product.

That is why Senators Hart and Magnuson have included in their legislation two crucial reforms to help consumers with their insurance shopping. Auto insurance ratemaking would be put on a standard basis. Consumers could easily shop and compare rates, thereby promoting greater efficiency in the open market tradition.

There is one serious problem with this sort of price competition. Some insurance companies might choose to compete by lowering the quality of their service—primarily by attempting to cut down on claims payments. Consumers Union's own recent survey of its members' auto insurance claims experiences indicated a significant difference in claims handling by 25 of the largest insurers. Among respondents to our questionnaire who had collected on first-party auto insurance claims for collision, fire, theft, medical payments and such, only 7 percent said they had been paid too little money. But the record was not by any means the same for every company. One company underpaid 11 percent of its claimants in our survey, while another company underpaid only 3 percent. Our statistical analysis indicated the difference between a 3 percent and an 11 percent level of satisfaction with claims payments was a highly significant difference.

One good way to prevent insurers from degrading their service would be to subject all companies to a continuous survey of the kind we conducted. The Hart-Magnuson legislation would mandate a continuing survey by the Government, with the results made available to the consuming public. The DOT plan, on the other hand, would leave consumers in the dark about both price and quality.

It is not immediately clear, however, from reading the Uniform Motor Vehicle Insurance Act, S. 945, how it would aid price comparisons and claims-paying comparisons. The intent is there, Senator Hart tells us. In his introduction of this legislation last year, he said :

We are also opening up a whole new world for most consumers—one where they do not take what they can get in auto insurance, but take what they want.

In order to know which company offers the soundest deal, a consumer must know not only the prices for his classification but the claims-paying practices of the company. Therefore, the bill provides that such information be reported to DOT. The Secretary, in turn, will make it available to the public.

This is exactly what the consumer needs. We hope the intention can be made more explicit in the act itself.

Despite the timidity and shortcomings of the DOT plan, Consumers Union believes the plan worthy of consumers' support at the State level. There is something to be said for using the States as laboratories for experimentation with innovations in auto insurance. But acceptable legislation in the States will run head-on into the opposition of lawyers. As the DOT study found out, a significant percentage of lawyers make most of their living from personal injury clients. No-fault insurance would take away that living. Even a modicum of no-fault coverage, as in Massachusetts, threatens to eliminate the personal-injury lawyer's clientele. In the first 2 months of operation, the Massachusetts system saw injury claims drop by 50 percent, when everyone thought they would rise. No one as yet knows the explanation, but State Insurance Commissioner C. Eugene Farnam told us last month that the drop was probably due in large part to the discouragement of spurious claims.

Unfortunately for the chances of auto insurance reform, State legislatures tend to be dominated by lawyers. In New York State the bar association has mounted a very costly direct-mail advertising campaign against the Rockefeller-Stewart plan, which closely resembles the DOT plan. Secretary Volpe's recommendations seem to have stimulated increased efforts in the legal community to head off no-fault insurance at the legislative pass.

For political reasons and also for the sake of achieving an acceptable level of uniformity of insurance law on our interstate highways, Federal legislation is the motorist's last best hope. The Hart-Magnuson Uniform Motor Vehicle Insurance Act comes closer than any other plan now under consideration to meeting Consumers Union's 14 goals for reform. Its most serious defect, in our opinion, is that it would leave the regulation of automobile insurance rates in the hands of the States. On the record, most State insurance departments simply cannot cope with the problems of rate regulation, financial solvency, and consumer complaints. Under this regime, the auto insurance industry claims it is heading for bankruptcy and is fleeing from the business. We would prefer to see the rate-regulating and the fiduciary aspects of regulation transferred to the Federal Government where competent legal, financial, and actuarial skills could be most efficiently and effectively used. The whole setup could probably be financed with a tax of 50 cents a year on each motor vehicle insurance policy. Complaint handling, however, might best be left to the State insurance agencies, which are closer to the people.

The need for insurance reform is immediate. Consumers can wait no longer for States to act individually. We are faced with a crisis of uninsurability, runaway rates, and uncompensated victims. Only Washington can solve the problems effectively. Consumers Union commends this committee for its inquiry. By voting out a bill with all the features of the Hart-Magnuson bill and by improving it along the lines suggested here, you will be doing a magnificent service not merely to 90 million owners of private cars but to all 200 million Americans in this motorized society.

Thank you.

U.C. BERKELEY LIBRARY

Senator HART. Thank you, Mr. Klein, both for the support you voice and for the suggestions you make with respect to improvements. Mrs. Angevine, you may proceed.

**STATEMENT OF MRS. ERMA ANGEVINE, EXECUTIVE DIRECTOR,  
CONSUMER FEDERATION OF AMERICA, WASHINGTON, D.C.**

Mrs. ANGEVINE. My name is Erma Angevine, executive director of Consumer Federation of America. The Consumer Federation's membership represents some 30 million Americans and is comprised of State, local, and national consumer organizations and encompasses volunteer organizations with a consumer interest, including many of the Nation's leading labor unions.

In January of this year, the delegates from these member organizations met here in Washington and asked that CFA come up with some guidelines on auto insurance reform. At that same time they set as one of their top priorities the passage of auto insurance reform legislation.

CFA's board of directors followed up this request by asking Consumers Union to make available to the members of Consumer Federation of America the position paper which it was drafting in consultation with other consumers. CFA released this guideline to its members on March 8, including the 14 points Mr. Klein has been discussing.

We are, therefore, here to say that CFA supports Consumers Union's statement and that our membership is in support of the testimony of Bob Klein. We would like to have CFA's name added to his testimony as a supporting witness.

Thank you.

Senator HART. That certainly will be done.

Mrs. ANGEVINE. I would also request to put in the news release announcing this, if this meets with your permission, sir.

Senator HART. The news release will be printed in the record.

(The document follows:)

CONSUMER FEDERATION OF AMERICA,  
Washington, D.C., March 8, 1971.

**C.F.A. PROPOSES GUIDELINES FOR AUTO INSURANCE REFORM**

WASHINGTON, March 8—The Consumer Federation of America today sent its 189 member organizations a set of guidelines for automobile insurance reforms to support and press for at state and federal levels.

Under the CFA "no-fault" guidelines, all medical costs and most lost wages would be paid for no matter who is to blame for the accident.

The auto insurance reform guidelines were promised to the membership at the CFA annual meeting here in January. The final position paper was drafted by Consumers Union following consultation with representatives of other consumer groups. A detailed report on the guidelines will be published in the April issue of *Consumer Reports*, CU's monthly.

The Consumer Federation's membership represents some 30 million Americans and is comprised of state, local and national consumer organizations and encompasses voluntary organizations with a consumer interest, including many of the nation's leading labor unions.

CFA's executive director, Erma Angevine, said, "The time has come for a consumer crusade for significant auto insurance reform and our membership needs to be in the forefront of this fight."

The CFA statement says something must be done to pay the cost of highway injuries, while stopping "the runaway price of insurance and the wave of millions of cancellations, nonrenewals and rejections of motorists by insurance companies."

CFA's guidelines adopt in principle the so-called "no-fault" approach of such proposals as the Keeton-O'Connell plan, the American Insurance Association plan, the New York state plan, and the more recent plan proposed by U.S. Sen. Philip A. Hart.

The Nixon Administration has not yet announced its position on auto insurance reform.

The CFA concepts incorporate many of the features found in the four major no-fault proposals and amend some in an attempt to provide a set of criteria that would effectively meet consumer needs if incorporated in a federal act. It would eliminate the \$10,000 limitation in the no-fault benefits proposed by the Keeton-O'Connell plan, and CFA's proposal for unlimited wage replacement for disabled victims is more extensive than all but the New York state plan.

The CFA stance on reform expands on all but the Hart proposal to include the provision that auto insurance policies must be noncancellable, guaranteed renewable, and available in the open market to all eligible consumers as long as they pay the premiums. CFA agrees with the major proponents of auto insurance reform that every car owner would have to buy the basic non-fault automobile insurance from a company of his choice, and that he may buy optional extra coverage.

Under the no-fault proposals, highway victims would not have to prove another driver's negligence in order to be paid back the injury expenses taken from their own pockets. Because it says auto insurance is so costly and return so little of the premium. CFA's guidelines would have to pay only for injury cost not covered by health insurance, sick leave, Social Security and other forms of insurance.

The guidelines also call for a ban on unilateral cancellations and nonrenewals of coverage by insurance companies. Insurers would have to sell insurance to everyone eligible to drive, instead of only being required to take its share of "assigned risks."

If possible at a reasonable premium, the new insurance would pay for more than out-of-pocket losses to all permanently disabled or disfigured victims. They would receive compensation for their pain and suffering as well. The guidelines state, however, that it may prove necessary, because of the cost, to preserve the permanently crippled victim's right to sue. Except for that one possibility, law suits based on driver negligence would be eliminated.

Regulation of the insurance industry, its rates and practices would be moved to a new federal agency from the individual states. Premium rates would be open to competition, and every company would have to use the same rating system so that consumers could easily compare prices. The government would also publish data permitting consumers to judge the quality of an insurer's claim service.

Insurance covering damage to cars would remain optional. Motorists would have three choices: They could choose no auto damage insurance. Or they could buy insurance under which their own company would pay them when another driver was at fault. Or they could choose today's collision insurance.

Senator HART. Movement of legislation of this sort is always difficult for reasons which are perfectly understandable and not improper. I think if you were making book a year or 2 years ago you would not have anticipated that we seem to be as close to enacting no fault legislation of some sort by this Congress as we are, but no matter what the good omens may be, when the crunch goes on, as it will, the position of the Consumer Federation of America in support of the effort will be of vital importance.

So, in your next mailing, report that the troops should be prepared to defend the position they have now taken and seek to persuade others to join the ranks.

Mrs. ANGEVINE. I shall indeed do so.

Senator HART. With special emphasis on enlisting the Members of the Senate to join.

Before asking other questions, coming back on the trolley car from that rollcall vote, I sat with a colleague who asked me what I was doing and I said we are having hearings on no fault insurance, and

U.C. BERKELEY LIBRARY

he said well, it certainly needs a lot of change, but tell me, if some clown goes driving down the road at 90 miles an hour and hits a culvert, why should I pay for him. For two reasons, to report first that our colleagues not on this committee are thinking about this problem, and, second, perhaps out of their own wisdom or at the suggestion of somebody else they are now asking this question about the proposal. What is the best answer, as you see it, to give to a person who has that concern?

Mr. KLEIN. I can think of two answers that might satisfy people. The first one is this: If your son crashes while barreling down the road at 90 miles an hour, is he going to receive all the medical care he will need? Who will pay for that care if you cannot? Most insurance is designed to pay regardless of fault. If the speed demon is killed, his life insurance still pays off. If your house catches fire because you were careless with matches, your fire insurance still pays off.

To cite the experience of some speed demon is to carry matters to absurdity. All of us run terrible risks when we drive, and the system you are proposing alleviates those risks.

The second answer is you already pay for that fellow. If we have a compassionate society at all, we see that he is taken to the hospital and tended to, medically. Of course social security doesn't ask how you are injured in paying disability payments. We think that is right. Society has to carry these burdens anyway. They should be carried in a way that is dignified and yet as inexpensive as possible.

Senator HART. Thank you.

For the record, you commented as one of the desirable features in the proposal, S. 945, that it would prevent skimming. Briefly for the record, describe what that term means.

Mr. KLEIN. As I understand it, another expression for it is creaming the market. The objective is to sell insurance only to the people who are not likely to have claims. If you can restrict most of your selling to those people you will have a bigger underwriting gain and you can compete well in price. So, insurance companies have tended, some at least have tended to skim the market, swim only the low risks and avoid the high risks.

Senator HART. Some of these reform plans that you discussed, that are referred to in your testimony, provide for the sort of subrogation between the carriers. They provide for the determination of fault as between the insurance companies even though we would go to a no-fault basis for payment of the individual. How do you react first of all, to the suggestion that we could have no-fault with respect to the individual's claims but let the insurance companies battle it out on a negotiation basis afterwards?

Mr. KLEIN. I think if the insurance system were set up as we suggest, so that every insurance company must accept every eligible applicant and so that the surcharges and discounts are standardized, they probably would not need to have subrogation.

What they are doing, I really do not know, Senator, but one would deduce that when you skim the market and do not subrogate, you lose the advantage of skimming the market. Of course, subrogation is an expense. It is one of these overhead factors that makes automobile insurance so darn expensive, and we are very much against that.

Senator HART. It surely would detract from the increased efficiency that we think we are building in the system.

Mr. KLEIN. Oh, yes.

Senator HART. And it could cost the insurance more absent that feature?

Mr. KLEIN. It is interesting that Professor Keeton in the Keeton-O'Donnell book proposed an approach to collision damage coverage. In their book they said there ought to be two choices. You could buy collision insurance which paid regardless of fault or you could pay insurance that would only pay you if the other fellow is at fault. If that were the case you would collect from your own insurance company.

Of course, that might open this business of subrogation. But, instead of subrogating, Keeton suggested every once a year or so insurance companies would get together and simply balance their books. Those who paid too much in proportion to their premiums to cover claims of that sort would collect from those who paid too little. That would certainly minimize the problem. Perhaps we can do away with it altogether.

Senator HART. In addition to the added cost, if there was subrogation as between the insurance companies, would not the policyholder, though he had been paid on the no-fault basis, be spending part of life in the courthouse just as he is now?

Mr. KLEIN. One would expect he would, yes.

Senator HART. The matter of inconvenience is still present even though you have been paid the cost that you incur.

Mr. KLEIN. If that were necessary, it would be more than an inconvenience. Some people would have to give up a day's wage to appear. It is a most undesirable situation. I understand that Massachusetts has left the situation that way.

Senator HART. You, I think, refer to this in your statement but I think it would be useful for separate explicit comment on the record.

You endorse the Hart-Magnuson provisions, including the assurance that insurance would be available to consumers of every economic-social level. Now, this is not an entirely new concept, is it? The Federal Government has taken steps in other areas to insure the availability of insurance notwithstanding the social or economic strata; am I not correct on that?

Mr. KLEIN. If you are referring to the plan for fire and other damage to real estate, yes.

Senator HART. As a result of the concern with respect to the high level of crime, we are clearly following the pattern we set there.

Mr. KLEIN. Of course, the trouble is the private companies flee to these plans with the risks that they don't want to carry and, as a result, much too much insurance is put in those plans. As we said in our testimony, according to Mr. Bernstein, the Federal Insurance Administrator, they are defeating the principle of insurance by laying off the bad risks on Government and more and more narrowing their own customer field. The principle is established, yes, in fact, I think one could also use the example of life insurance to the GI's.

The Government insists that private companies must sell at their usual rates to GI's even if they come out of the service with a serious disability.

Senator HART. I am sure as we go along others will occur to us. Certainly, it is not a concept that just appeared yesterday from Mars or from Russia.

We talked about your 14 points. How close can you come in terms of dollar figures to identifying the cost of acquisition by policyholders of no-fault insurance which would include those 14 points? Would it cost them more or less than it does to acquire the average coverage available today? Do you have any idea of how much more available, if that is the word for it, the insurance product would be under the 14-point system?

Mr. KLEIN. I am afraid even if I go back to my office and tried, I wouldn't have figures for you on that question. I think we dealt with it in the midst of my testimony as much as we can discuss it. We think it will cost less, the premium will come down. We base that opinion on the actuarial studies of the AIA and New York State and the Keeton-O'Connell plan, including Mr. Robert Bailey of the Michigan Insurance Bureau. Mr. Bailey, the chief actuary there, said in 1967 this was an unworkable plan and was very much against it. In 1970 he re-analyzed his figures and came out in favor of it.

We are not in the process of costing this out. I don't think we could. I don't think it is within our competence and perhaps it is not within anyone's competence to write it down to the last penny. Obviously, when the bill is enacted, the work will have to be done. The data are there. The data from the DOT study on losses, particularly wage losses and long-term disability, are there, and they need to be updated. That plus the rate of claims that we see at places like Massachusetts.

Senator HART. You were present I believe this morning when the Senator from Utah, Mr. Moss, asked a question of Mr. Fournier, that concluded, as Senator Moss put it, that it is logical to use this set of figures to test, the potential for increased sums being available to compensate victims under the no-fault. Do you recall that exchange?

Mr. KLEIN. Yes.

Senator HART. Do you agree with the rather general outline of the arithmetic that they engaged in when going through it together? Would you have any quarrel with it?

Mr. KLEIN. No, but I think Mr. Fournier made it clear that their costs are largely startup costs.

Senator HART. No, I was jumping and thinking of the exchange.

Let me summarize it again and get your comment without incorporating it by reference.

As I recall it, about \$14 billion is the figure that is accepted as the total premium paid in 1970 for both personal injury and property damage of automobile insurance, and the overhead costs, the costs of selling and so on, run about \$5.8 billion, and there is a fee for lawyers of \$1.2 billion, and a figure of about \$7 billion for payment to accident victims and policyholders for both injury and damage to the cars.

The Department of Transportation study used a figure of about \$11 billion for injury and property loss. So—this was the exchange with Senator Moss—if there is \$14 billion of premiums paid, with administrative costs of about 10 percent, you computed administrative overhead of \$1.5 billion leaving out of the \$14 billion a total of \$12.6 billion for all injury and property loss.

Now, the DOT, in the range of accuracy, says there is a loss of \$11 billion out of premiums of \$14 billion. You could on that basis reduce by a billion six dollars as well as pay all loss of the \$11 billion and the administrative expense of \$1.2 or \$4 billion whatever that figure was. Does this jive with your impression?

Mr. KLEIN. Not so long as you are discussing property damage as well as injury. We will never get property damage insurance, collision insurance from the automobile insurance companies in any way related to the ratio of the benefit to the premium. We are lucky to get 70 percent back from the automobile insurance industry. We would have to separate the personal industry loss. Their promises are greater for those savings.

Senator HART. Let me, without pushing the clock beyond our luck, permit you to look at that question again. I am not talking about the present private insurance pattern, and it is not fair really to throw those figures out and ask you for an answer, but let us have an answer for the record responsive to that pattern of figures.

(The following information was subsequently received for the record:)

Mr. KLEIN. That pattern of figures certainly would indicate that all fatality, injury and property damage losses from highway accidents could be compensated in full with the money currently spent on automobile insurance premiums, if we had a no-fault system operating at 90 percent efficiency. Unfortunately, the pattern of figures is incorrect. Accident losses of \$11 billion were approximately those estimated by the Department of Transportation for 1967.<sup>1</sup> Insurance premiums were those for 1970, and they include nonaccident coverages for fire, theft and comprehensive.

A comparison of 1967 losses and premiums would look like this:

*Compensable losses*<sup>2</sup>—(DOT study)

Medical expenses.....	\$1, 243, 000, 000
Wage loss.....	4, 239, 000, 000
Other.....	207, 000, 000
Property damage.....	4, 860, 000, 000
Total .....	10, 549, 000, 000

*Premiums written*<sup>3</sup>—(Best's aggregates and other sources)

Bodily injury liability.....	\$4, 622, 000, 000
Property damage liability.....	1, 943, 000, 000
Collision .....	2, 289, 000, 000
Total .....	8, 501, 000, 000

In 1967, then, \$8.5 billion of premiums would have been available to help pay \$10.5 billion of losses. Assuming a no-fault system capable of operating with administrative costs of 10 percent of total premiums, full compensation would have required a premium input of \$11.7 billion, an increase of \$3.2 billion from actual 1967 premiums written—or 38 percent additional premium input.

While the problem of financing the nation's highway accident losses is not as easily solved as Senator Hart's figures would suggest, neither is it as costly a proposition as the above figures might seem to indicate. For we have not taken into account the compensation received by accident injury victims from collateral sources. The DOT study again supplies the needed figures. With compensation from life insurance omitted (since none of the no-fault plans considers life

<sup>1</sup> Department of Transportation. *Motor Vehicle Losses and Their Compensation in the United States*. Page 6, Table 2.

<sup>2</sup> Ibid.

<sup>3</sup> Insurance Information Institute. *Insurance Facts 1970*. Page 11.

insurance as an offset against uncompensated loss), those injured in all auto accidents in 1967 received or could anticipate receiving—from hospital, medical and other injury insurance, paid sick leave, workmen's compensation, social security and other current and future benefits a total of \$1.4 billion.<sup>4</sup> A comparison of 1967 net compensable bodily injury losses with total bodily injury premiums written the same year shows the following pattern:

*Losses attributable to death and injury—(DOT study)*

Medical expenses.....	\$1, 243, 000, 000
Wage losses.....	4, 239, 000, 000
Other .....	207, 000, 000
Total .....	5, 689, 000, 000
Less collateral sources.....	-1, 409, 000, 000
Net loss total.....	4, 280, 000, 000

Bodily injury liability, first-party medical payment and uninsured motorist premiums in 1967 totaled \$4,622,000,000.

Thus, in 1967 the premiums paid for insurance covering injury and death from auto accidents would have exceeded the victims' net economic losses by about \$350 million, almost enough to pay the overhead of an insurance system operating at the efficiency level achieved by the Puerto Rico Accident Compensation Administration in its first year. By contrast, the present system in the year 1967, encompassing bodily injury liability insurance and all collateral sources (including life insurance), compensated only about one-half the losses from serious and fatal injuries. In so doing, the system tended heavily to overcompensate those least seriously injured and to undercompensate those most seriously injured.<sup>5</sup>

I wish to thank the Committee for this opportunity to answer Senator Hart's question with the benefit of adequate reference sources.

Senator HART. On the property damage you have endorsed the bill which involves authorizing the Department to set standards with respect to automobile construction industry that relate to property damage as well as safety; you do endorse that?

Mr. KLEIN. We do.

Senator HART. That I believe will give promise to reducing, I think substantially, in the years ahead the property damage; at least it should have that effect.

There is another feature; I think you did mention it in your testimony, but I would like an explicit reaction to it.

We are attempting in the proposal we have filed to eliminate, lift, and nullify the restrictions against mass merchandising of auto insurance. You did endorse that explicitly in your statement?

Mr. KLEIN. Yes; we did.

Senator HART. What potential benefits to the consumer do you see in that, and are there some problems, some detriments that might be claimed if we went in that direction?

Mr. KLEIN. Well, the studies of your own staff indicate that group or mass merchandising of automobile insurance coverage would reduce the bureau rate by 15 percent. I say the bureau rate. Many people insuring with the direct writers enjoy that 15-percent reduction anyway. The direct writers, if we get into the group field, will probably realize another 15 percent.

It seems to me for group automobile insurance coverage to have any mass appeal, part of the premium has to be paid by the employer. Oth-

<sup>4</sup> Ibid.

<sup>5</sup> Department of Transportation, *Economic Consequences of Automobile Accident Injuries*. Vol. 1, Page 2.

erwise, the experience has been that there is adverse selection. The poor risks take that insurance and the good risk continues with his present coverage. So, there is that problem with it.

But my goodness, it should be available. The reason there are State laws or administrative rules against group insurance is to protect the automobile insurance agent, the seller of individual policies. That is not good social and public policy. Let's let this industry reach its maximum level of efficiency and reduce its selling costs to the lowest point it can reach.

Therefore, we support your plan and we hope that employers' contributions to their employees' group plans can be tax exempt as another of your bills would provide. Obviously, this won't benefit the person who doesn't work for a large employer, the person who works for himself. So, it isn't a universal benefit. Although, as we see it, eventually universal benefits will be in some sort of public health plan. Then, we have the ultimate group and the wisest and best kind of coverage.

Senator HART. Now, both of you speak for and work with consumers who I am sure are markedly above average in their understanding and interest in making any purchasing decisions, but even as to them I would ask you to go beyond and speak to those who are not identified as readers of *Consumers Report* and members of the federation; endorse the feature of S. 945 which requires the Department to report the pricing quality of the policies that are being marketed. Do you think that could be put in a style that would mean anything to anybody?

Mr. KLEIN. Senator, if the answer to that question weren't "Yes," there would be no State Farm Insurance Co. There would be no All-state Insurance Co. These companies became large by charging the lower price. People recognize the lower price, and they do business with those companies. The entire 90 million automobile owners in the United States don't have to be aware of the low prices in order for those 90 million people to benefit from the competition on the basis of price.

As soon as any significant element of the population responds to a price, the competitive system works and everyone benefits.

Senator HART. I am not satisfied yet that the consumer information that is provided now on vehicle performance, provided by the Department to the car buyers, I shan't say, is worth the paper it is printed on but is pretty much Greek to almost every buyer, because every buyer assumes it is Greek—I don't know which way it goes—but it doesn't mean very much, does it?

Mr. KLEIN. Of course not. In order to find out any significant number of performance features about an automobile, one has to not only jot down the data on car A but has to go out and shop for car B, C, D, and F. And then, when he finds they vary, he has to decide which set he wants in his automobile.

Consumers Union has been in this business of rating products since 1936. If we had simply said to people, "Here is a table of the comparison of various data on phonographs or washing machines or automobiles, go choose them yourselves," we would have been out of business long ago. One has to draw these together into some unified judgment about which automobile is the best.

U.C. BERKELEY LIBRARY

What you are proposing for automobile insurance isn't all that complicated. You are going to tell us what the price is. In addition, you are going to tell us which companies settled their claim most judicially and fully. Those are simple matters if they are put out simply. Even if they are not, if they are made available to organizations like ours and many other publications, we will put them in the form that the public can understand. It will be of great value to our readers.

Senator HART. Am I correct in saying that it is important also to insure the benefits or savings that result from improved design, the benefits to insurers from the improved design and from periodic inspections that really are inspections? Dissemination of the information insures, does it not, that there will not be the temptation on the part of the insurance company simply to save for itself the moneys that will be saved as a result of these things? This kind of tabulated information will reflect to the consumer the availability of that kind of saving, would it not, if it is not a fact passed on? Could it not be designed to insure that?

Mr. KLEIN. Do you mean that by the statistics the Government would gather, the statistics that the companies would have to submit, one could tell whether company A was returning 70 cents or 80 cents on the dollar, is that the intention of your legislation? I take it that it is.

Senator HART. That's right.

Mr. KLEIN. Certainly that would help us recognize which company was doing the most for our dollar. It wouldn't necessarily tell us everything we need to know, though; company A might have a very efficient return of benefits and a low premium, but it might also be cheating on claims, underpaying its claims. We couldn't tell that just from the information that you are talking about now.

Senator HART. Mr. Sutcliffe, are there some questions you desire to raise that I have not?

Mr. SUTCLIFFE. Mr. Klein, one question related to your testimony advocating that automobile insurance remain secondary to other insurance coverages until such time at least that the cost of providing automobile insurance is commensurate with the cost of providing other insurance.

What does this do to your argument that we should attempt to reduce the number of price slots in our providing of insurance? In other words, if an insurance company had to put a price on a person's insurance and that price had to be calculated on the basis of what other insurance coverages were available, would this not increase measurably the number of slots that an insurance company would have to figure out?

If it would not, would any arbitrary averaging eliminate the potential advantages of making automobile insurance secondary to primary insurance?

Mr. KLEIN. Of course, insofar as the collateral sources are concerned, the other coverages that the consumer carries, it would be added and complicate the rate structure. There is no question about that and there is no way to get around it.

Obviously, if a man bought disability insurance because he knows he may be disabled in any number of ways, not only in an automobile accident, that man is paying that money himself, and he obviously

should not have to pay it again in his auto insurance. There is no question we will be creating additional slots. I don't think there will be that many additional slots. I think that can be manageable.

On the other hand, we can eliminate some of the rating classifications we have now. For one thing, every company I would hope would use the same geographic scheme. As matters stand, some companies' territories are not the same as others.

In addition, the attempt to define the difference in risk between a 25-year-old unmarried youth, a 26-year-old married youth, a 30-year-old female, and somebody who has a B-plus average in college, I think a lot of that can be done away with and we can eliminate some of the other 7 million slots.

It doesn't matter when you come down to it. If somehow you can legislate as we suggest so that there is a basic price that each company offered to the mythical average motorist, then we can go about seeing which company has the best basic price. If we know that no matter which company we go to our surcharge or discount will be the same percentage of that price our shopping problems are over.

Senator HART. What you are recommending then is a system of standardized deductibles as to other insured's coverage benefits in order to solve practically the problem of determining the number of slots.

Mr. KLEIN. As I understand it, it is not a matter of deductibles. If a customer has a medical plan that covers himself and his family, wife and children, and it covers him for almost everything he can anticipate in the way of injury expenses, he will obviously pay a very small medical premium to his automobile insurer through this system. I think the major difference would be in coverage for loss of wages.

Some people have good sick leave programs. You would have a considerable reduction in premium to measure against the bad side. If you happen to live in the city that would increase the premium by a certain percentage, but offsetting that might be a heavy coverage for your medical losses.

Senator HART. Perhaps the word deductible was not well chosen. The concept, however, was to suggest the possibility that the mandatory coverage in the auto policy could be met through other insurance and, therefore, you would provide a deductible within the mandatory coverages that your other insurance would fit into.

It is an unusual use of the word deductible but I think one that is descriptive of the process whereby you might coordinate insurance coverages and benefits to assure that everyone had the mandatory coverages but there was a freedom in the marketplace to choose other insurance sources to provide coverages at the least possible cost to the consumer.

Does that make sense? Is that logical, to approach it from that standpoint?

Mr. KLEIN. Yes, I think so. His Blue Cross major medical coverage might even be designated major automobile insurance, and the premium for that part of your coverage would simply be your medical premium.

Mr. SUTCLIFFE. Let me ask several more questions related to S. 976.

You have said that Consumers Union supports efforts to put property damage coverages on a first-party basis, is that correct? Does one

of your 14 points include property damage coverage on a first-party basis?

Mr. KLEIN. You are talking about property other than the automobile?

Mr. SUTCLIFFE. No; I am talking about the automobile itself.

Mr. KLEIN. Our proposal is that of the Keeton-O'Connell plan as recently modified. It gives the insured person three choices. He may buy first-party collision insurance with as much deductible as he chooses, or he may buy presently nonexistent coverage under which he would receive compensation for damage to his car from his own automobile insurer if another driver were at fault; that is, many people don't buy collision insurance perhaps because their automobile is old or perhaps because they can afford to be self-insured, and that is reasonable.

But if somebody else comes along and, totally by his own negligence, demolishes your car and you have no claim at all, that may seem unfair.

In that case, the plan says you would buy only collision insurance that paid you if somebody else was at fault. The third option is no coverage at all.

Mr. SUTCLIFFE. Your plan then would deny the liability action for property damage claims?

Mr. KLEIN. It would.

Mr. SUTCLIFFE. And you would meet that then in one of three ways, as you have outlined?

Mr. KLEIN. Yes.

Mr. SUTCLIFFE. Do you believe that a denial of the tort liability action for property damage as to the vehicle would have salutary effects upon the design of vehicles and the construction of vehicles?

Mr. KLEIN. Yes.

Mr. SUTCLIFFE. You would subscribe then to the Department of Transportation's statement that this would improve the property loss reduction capability of motor vehicles?

Mr. KLEIN. Yes, for the very obvious reason that the insurer would know the car that he is insuring.

Mr. SUTCLIFFE. And that would be reflected in reduced premiums for those vehicles that could sustain impacts without resulting property damage?

Mr. KLEIN. Yes, or indeed would prevent personal injury better than other vehicles.

Mr. SUTCLIFFE. So, you would subscribe to the injury severity index rating in S. 976 as well as the property loss reduction rating feature of the bill?

Mr. KLEIN. Yes, we do.

Mr. SUTCLIFFE. Do you support the diagnostic inspection requirements in S. 976?

Mr. KLEIN. I will have to beg off on that question because I haven't given it that much thought. I have read the legislation hurriedly, and I see what you are trying to accomplish, but I am not quite sure that I am competent to say whether there is such a thing as a diagnostic clinic that will do that accurately.

Mr. SUTCLIFFE. Perhaps after you have had a chance to review the hearing record of this committee, you could file a supplemental statement with your position on that legislation.

Mr. KLEIN. All right.

Mr. SUTCLIFFE. Do you have any views on the uniform titling requirements in S. 976?

Mr. KLEIN. Yes. That is an essential reform for the motorist. I think you make an excellent case for that. It should be done.

Mr. SUTCLIFFE. Thank you, Senator.

Senator HART. Do you disagree with a single word, Mrs. Angevine?

Mrs. ANGEVINE. No, sir; we support his statement.

Senator HART. Thank you both for helping us in this hearing.

Mr. KLEIN. It has been my privilege.

Mrs. ANGEVINE. Thank you, Senator.

(The article referred to earlier follows:)

[Reprinted From *Consumer Reports*, April 17, 1971]

## INSURANCE: THE ROAD TO REFORM

**A**utomobile insurance is by now probably the most thoroughly studied of all consumer problems. The verdict of investigators from the insurance industry, government, the legal profession and consumer groups is unanimous. Something must be done to make insurance do a better job of paying the cost of highway injuries. Something must be done to stop the runaway price of insurance. Something must be done to make sure the right kind of insurance is available to every car owner, and at a fair price.

The time has come for consumers to unite in a crusade for auto-insurance reform. Everyone else is getting into the act. The three major auto-insurance industry trade groups are sponsoring plans. Even the American Trial Lawyers Association, traditional foe of any change that might detract from the fees its members earn by representing accident victims, has drafted legislation in the name of reform. Actually, it's a last-ditch effort to patch up the present liability-insurance system.

Reform is already under way in Puerto Rico, where a government-run plan insures every accident victim for his full medical expenses and a modest amount of wages while he's disabled. Massachusetts inaugurated this year a compulsory medical and wage-loss policy and eliminated most liability claims for less than \$2000 of injury expenses.

Many states are now debating reforms based on three pioneering plans: The Keeton-O'Connell Plan, the American Insurance Association Plan (developed by one group of insurance companies), and the New York State Plan. All three would de-emphasize the role played by liability insurance, and the AIA Plan would do away with it entirely. Legislation patterned on the AIA Plan has a good chance of adoption this year in Minnesota.

Meanwhile, Senator Philip A. Hart has introduced in Congress a bill that would require every state to adopt a uniform kind of automobile insurance embodying principal features of the three preceding plans and some additional features contributed by the Senator himself. The Hart Plan contains much that consumers can support, although some important details remain to be worked out. Still awaited (as this issue goes to press) is the recommendation for insur-

ance reform being developed by the Secretary of Transportation as the product of a study ordered by Congress.

There is no single, perfect plan. Some students of the problem even doubt that the system of privately sold insurance can be salvaged. They look toward government insurance. Certainly, the problem is made less critical by state-administered health-insurance and medical-care plans in those countries that have them. Then, at least, there is never a question of availability of medical care for all victims regardless of ability to pay and regardless of whether they are victims of automobile accidents, other accidents or illness.

CU believes that this country's automobile insurance should be revamped with a view to the universal health insurance that appears to be somewhere on the horizon. With that in mind, we present on page 225 a 14-point set of objectives that we think are required in a reform designed in the best interests of consumers as policyholders and as claimants.

To place those objectives in an understandable framework, let's first take a look at what's gone wrong with the present system.

At issue is liability insurance and the legal doctrine that makes it necessary. The law says a motorist whose bad driving kills or injures someone or damages his property must pay for the damage. Bad driving, the law says, includes not only recklessness but also carelessness. Almost everybody makes mistakes behind the wheel, and sometimes mistakes cause accidents costing many thousands of dollars in medical bills and lost wages. Liability insurance is designed to protect the financial assets of car owners from those possibly overwhelming obligations to people they may injure. The insurance company pays what its policyholder would otherwise have to pay his victims.

Society invents laws for a purpose. One idea behind liability law is to deter people from carelessly hurting other people. Automobile insurance, though, relieves individual motorists of heavy financial penalty by spreading the risk among all insured motorists. Little or no financial risk means little or no deterrent to carelessness. But the liability

## AUTO INSURANCE

continued

doctrine of deterrence wasn't very sound anyway. The instinct for survival is doubtless a far stronger incentive to safe driving.

The main social purpose of liability law is to see that innocent victims are paid their losses. Hence, every state either compels or puts heavy pressure on car owners to buy automobile insurance. One of the intolerable things about it is that the system works out unfairly. People with minor losses tend to be overpaid, while people with severe losses are likely to be underpaid. Here are some things a Department of Transportation study found out about seriously injured traffic victims who collected on liability-insurance claims:

People who suffered less than \$500 injury costs collected an average of four times their losses.

People who suffered from \$10,000 to \$25,000 injury costs collected an average of half their losses.

People who suffered more than \$25,000 injury costs collected an average of only about 15 per cent of their losses.

The study counted only the kinds of costs that took money from the victims' pockets; it made no estimate of the costs of pain and suffering. Insurance payments were measured after subtracting lawyers' fees, which cost victims an average of 25 per cent of their benefits.

Only about 45 per cent of seriously injured people in auto accidents collect any money from liability insurance. There is obviously no such right of payment for victims of one-car accidents or for those whose careless driving led to their

own injury. Most state laws call for no liability payment if both drivers made mistakes. There is no auto-insurance liability payment, either, where no one is to blame for the accident or where a defective car or a defective highway is to blame. There is many a crash that embroils its victims in deadlocked argument over who was to blame.

Other kinds of insurance help to fill the gap in accident expenses left when there is no liability claim or when liability insurance underpays. But the Department of Transportation study found again that those most severely hurt are often left in financial straits. When a highway accident takes more than \$10,000 from the victim's pocket, only three victims in 10 recover more than half their losses—and that's counting payments from sick-leave plans, social security, collision coverage and so forth.

### Rising premiums

The steeply rising cost of automobile insurance makes the poor delivery of its benefits all the more deplorable. In the 10 years to 1970, Senator Hart has noted, premiums went up faster than even the soaring cost of car repairs and medical care.

Automobile liability insurance fails to put the money where it's most needed. About 56 cents of every dollar spent on liability insurance pays for insurance-company expenses and lawyers' fees. Half the remaining 44 cents pays claims for pain and suffering, as opposed to actual out-of-pocket expenses. An additional 8 cents pays for expenses already covered by other kinds of insurance. That leaves about 14 cents to pay for medical costs and lost wages that otherwise would not be recovered by the victim.

In short, what has come to be called the fault system

## "We regret to inform you that your policy . . ."

The problem of buying and keeping automobile insurance may once have burdened only the dangerous driver. Nowadays, cancellation notices are no respecters of a good driving record or a high standing in one's community. *The New York Times* reports, "Insurance agents who have been in business for years are complaining that their contracts with the companies are being canceled for 'arbitrary' reasons. The cancellations often mean that consumers have to pay more money for less coverage."

The epidemic of cancellations is nationwide. Here is a sampling of complaints.

Dear CU: I would like to inform you of a letter I recently received from the Travelers Indemnity Co., Roscoe office. It states that my agent is no longer placing his business with them, so they will not be renewing my automobile policy after February 18, 1971. My wife and I have a clean driving record with this company. We have no driving offenses marked against us. We have no other

drivers at home. We reside in a quiet place and park off the street. Now I notice that the Travelers have six other agents near our area, the nearest a five-minute drive. . . . I believe that a company that refuses to renew a policy for a driver with a clean record should pay a penalty to be shared by driver and state.

SALEM, VA.

W.H.

Dear CU: Just when I felt I had good insurance after reading your Ratings on insurance companies, I got a notice that Safeco will not renew my automobile insurance next month. I presented a collision claim in November when I inadvertently backed into a stone wall in an unfamiliar driveway, and they paid the claim. One claim and I understand from my agent, they cut you off. Hope you can convey this information so that others who have Safeco coverage will not have accidents.

YACHTS, ORE.

K.H.S.

Dear CU: I feel that you will be interested in the following correspondence with Sentry Insurance Co. after it canceled our insurance without any reason.

"The facts are as follows: During the seven

years that I have carried a Sentry policy there have been two minor claims totaling less than \$100, one about five years ago and one about three years ago. In the some 24 years that my wife and I have been driving, and the five years that we have included youthful drivers under our policy, no member of the family has ever received a traffic citation for any reason, and no driver has ever been involved in an accident of major consequence.

"With regard to my son, whom you list as a youthful, principal driver, he drives less than 10 per cent of the total mileage driven in the family, although he is the principal driver of our third car. I cannot understand why he should be put in a class that penalizes him and the family. He was an honor student in high school and is one of some 20 freshmen at his college enrolled in the honors program and maintaining a high academic standing. In high school he won the 'Outstanding Athlete' award. He was selected as representative to Badger Boys State. Upon enrolling in college, he was awarded a Lutheran Brotherhood Youth Leadership Award and Scholarship (a national award).

U.C. BERKELEY LIBRARY

of auto insurance has broken down; yet law and public policy force almost all car owners to buy fault insurance from private companies. Besides misdirecting consumer expenditures, the fault system puts a heavy and costly burden on the time and facilities of the civil courts. Those who must pursue their claims in court sometimes wait as long as five years for a verdict, and the average claim takes 16 months to settle. The delay and uncertainty of liability-insurance benefits throws part of the medical cost of auto accidents on

the shoulders of the general public through higher taxes and higher hospital bills.

Worst off are the victims. The Department of Transportation study translated hardship into numbers. When serious injury occurs on the highway, 5 per cent of the stricken households have to send other members of the family out to work; 3 per cent have to move to cheaper housing; 20 per cent have to take money from savings or the sale of property; 12 per cent miss debt payments.

## The goals of auto-insurance reform

*In CU's view, the following 14 objectives should be met by any reform plan.*

**1. MEDICAL CARE.** All people injured in car accidents should receive, at first mainly from private insurance but soon, we hope, from a Federal health plan, the expenses of complete medical care, including rehabilitation. Automobile medical-insurance benefits, like other medical insurance, should be paid to all who are hurt, regardless of who caused the accident, including drunk drivers and drugged drivers. Such people must be kept from driving. But depriving them of medical care won't keep them off the road; it will only visit hardships upon their families.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—No, it limits no-fault benefits to \$10,000 per person.

*American Insurance Association Plan*—Yes.

*New York State Plan*—Yes.

*Hart Plan*—Yes.

**2. WAGE REPLACEMENT.** All disabled victims who cannot work should receive the equivalent of their take-home pay, their earning capacity if they are students or unemployed, or their services to their families—all such payments to be limited to an amount adequate to sustain a decent standard of living in their community. No one should receive more money than he was taking home before being injured, however. Social security pays some wage loss already to disabled persons. It should be expanded to do the full job.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—No, it limits wage replacement to \$750 per month and counts that as part of the \$10,000 maximum no-fault benefits.

*American Insurance Association Plan*—No, it limits wage replacement to \$750 per month but does pay it indefinitely.

*New York State Plan*—Yes, it goes beyond the objective by paying unlimited wage losses.

*Hart Plan*—No, it limits wage replacement to a total of \$30,000 but does provide up to \$1000 per month, enough for an adequate living standard at present price levels.

**3. PERIODIC PAYMENT.** Auto-accident-insurance benefits should be paid to victims month by month as expenses and wage losses occur.

*Do the major reform plans meet this objective? Yes.*

**4. OTHER INSURANCE.** Auto insurance should take care of paying only what less-costly insurance plans do not cover. Most plans, including social security, group hospital and medical policies, Blue Cross, and individual health policies

now return a far larger percentage of the premium to the policyholders than auto insurance does.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—Partly. Though it does away with duplicate payments for the same loss, it might leave automobile insurance as the primary source of benefits, at least until there is a government health-insurance system.

*American Insurance Association Plan*—No. Same as Keeton-O'Connell.

*New York State Plan*—Yes.

*Hart Plan*—Yes.

**5. GROUP AUTO POLICIES.** State laws and administrative rules obstructing the sale of group automobile insurance should be overruled by Federal law. Many states have been persuaded by auto-insurance agents to hamper group sales and such mass-marketing devices as insurance for a company's employees on the payroll-deduction plan.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—No. But the plan itself would encourage group selling.

*American Insurance Association Plan*—No. Same as Keeton-O'Connell.

*New York State Plan*—Yes, in that New York has no law against group insurance.

*Hart Plan*—Yes.

**6. CANCELLATION.** Auto-insurance policies must be non-cancelable, guaranteed renewable, and available in the open market to all eligible consumers. Everyone licensed to drive or able to register a car should be eligible as long as he pays the premiums. The situation now is that 14 per cent of motorists have had their insurance canceled, and when one company cancels, others tend not to accept you. From 8 to 10 per cent of car owners must now buy through assigned-risk plans because no company will deal with them voluntarily; yet an eight-state analysis of assigned-risk policyholders found that 53 per cent of them had had no accidents or convictions for traffic violations. The price of being an assigned risk is very high—sometimes double the standard rate. In most states the most insurance you can buy as an assigned risk is the minimum liability coverage required by the state.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—No.

*American Insurance Association Plan*—No.

*New York State Plan*—No.

*Hart Plan*—Yes.

## AUTO INSURANCE continued

**7. PAIN AND SUFFERING.** The number of claims for pain and suffering should be greatly curtailed, leaving only the most serious ones. Most such claims today are paid to victims of minor injuries rather than to the seriously hurt. The average person with medical expenses of less than \$100 and with a lawyer to press his claim receives six times his loss. With the elimination of petty claims for pain and suffering, the insurance system might be able to pay, in addition to out-of-pocket losses, at least some compensation to seriously disfigured and permanently disabled victims. Preferably, every such victim should be paid. If that makes insurance too costly, it may be necessary to preserve his right to sue a negligent driver.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—Yes, by means of a \$5000-deductible liability claim against a faulty driver.

*American Insurance Association Plan*—No.

*New York State Plan*—No.

*Hart Plan*—Yes, by means of a liability claim against a faulty driver for permanent disability and disfigurement.

**8. PROPERTY DAMAGE.** Damage done by automobiles to property other than automobiles should be repaired with money from the car-owner's automobile insurance even if the accident was not his fault.

*Do the major reform plans meet this objective?*

Yes, except that the Hart Plan makes such coverage optional.

**9. COMPULSORY COVERAGE.** Every car owner should have to carry the basic no-fault automobile insurance. Companies could offer all kinds of optional extra coverages: higher benefits for pain and suffering, higher wage benefits, etc.

*Do the major reform plans meet this objective?* Yes.

**10. AUTOMOBILE DAMAGE.** The consumer should have three choices of automobile damage insurance: 1) no collision insurance, 2) today's type of collision insurance, which pays for damage regardless of fault, 3) insurance that pays damage done to his car if the driver of another car caused the accident. The third choice should be offered in fairness to owners of cars with too little value to merit full collision insurance. Collision premium rates should be scaled, as some companies scale them now, to encourage construction of damage-resistant cars. Fire, theft and comprehensive insurance should be optional, as now.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—Yes, it originated the three-choice idea.

*American Insurance Association Plan*—No. It offers full collision insurance or nothing.

*New York State Plan*—No. Same as AIA.

*Hart Plan*—No. Same as AIA. But this is the only plan that would require premiums based on damageability of the car.

**11. PREMIUM RATES.** They must be held down and, if possible, reduced. A system that pays benefits without attempting to establish blame can redirect to premium savings or improved benefits at least 25 per cent of the cost of today's liability insurance. Elimination of automobile-insurance

payments for losses already covered by cheaper insurance will cut the premium further. Elimination of pain-and-suffering claims for minor injuries will cut costs even more.

*Do the major reform plans meet this objective?* Yes, all claim to. But there is disagreement on the savings. The Keeton-O'Connell Plan puts a \$10,000 limit on no-fault medical and wage benefits because its actuary could not otherwise foresee reduced premiums.

**12. PRICE COMPARISONS.** The driver-rating system should be standardized. A person's age, sex, where he lives, the car he drives, and how much he uses his car do appear to have a real bearing on his chances of having an accident. With no-fault insurance, companies should also design their rates around the size of the family, its other insurance and its income—in other words, those factors that would determine compensation in the event of an injury-causing accident. The important thing is for each company to use the same rating standards, including identical geographic rate zones. Companies should compete on the basic price from which all rates would be figured by percentage increases or decreases. Shoppers would then find it relatively easy to compare prices.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—No.

*American Insurance Association Plan*—No.

*New York State Plan*—No.

*Hart Plan*—Yes, it originated the idea.

**13. CLAIMS SERVICE.** Insurance companies should report regularly to a Government agency their claims-paying practices, and the agency should publish data indicating how well each company satisfies its claims. CU's recent survey of claims experiences showed significant differences in the way companies handled their claims (CONSUMER REPORTS, June 1970). Full knowledge of the quality of a company's service is essential to the consumer's rational choice of a company.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—No.

*American Insurance Association Plan*—No.

*New York State Plan*—No.

*Hart Plan*—Yes, it originated the idea.

**14. INDUSTRY REGULATION.** Automobile insurance should be regulated by a Federal agency instead of by each individual state. It would be appropriate for the motoring public to finance the agency with a tax on insurance policies. Present law exempting insurance companies from the antitrust laws should be repealed. Prices should be regulated by the market under surveillance of the new Federal agency. Few states can hire the professional staffs needed to cope with their regulatory obligations. A single Federal agency could afford highly competent attorneys, accountants and actuaries and could use their services efficiently in the public interest. The American population is mobile. It travels on interstate highways, and it changes residence frequently from state to state. Americans need uniform motor-vehicle laws and uniform automobile insurance.

*Do the major reform plans meet this objective?*

*Keeton-O'Connell Plan*—No.

*American Insurance Association Plan*—Does not specify.

*New York State Plan*—No.

*Hart Plan*—No. Insurance regulation would remain with the states in consultation with a Federal administrator.

U.C. BERKELEY LIBRARY

Senator HART. Before we hear from our next witnesses, I would like to insert in the record a telegram to Senator Magnuson from Miss Betty Furness, chairman of the New York State Consumer Protection Board:

Senator WARREN MAGNUSON,  
U.S. Senate,  
Washington, D.C.:

As hearings begin on your proposed no-fault automobile insurance bill, I want to add my voice to the many others who will be speaking out in favor of it. Our present system denies compensation to one-quarter of all persons injured in automobile accidents. Our present system allows insurance companies and agents, lawyers and claims investigators to take up to 56 cents on every personal injury liability insurance premium dollar. The fault system encourages dishonesty and overreaching by both claimants and insurers. The system abounds with unwarranted policy cancellations. I strongly favor the no-fault auto insurance concept. I support a system which will lower insurance premiums while compensating all auto accident victims, except deliberate lawbreakers. I am confident all the testimony given at your hearings will clearly demonstrate that the time for no-fault auto insurance is long overdue.

BETTY FURNESS,  
*Chairman, New York State Consumer Protection Board.*

Apologizing first to the gentlemen who will now come forward, when we talk about consumers here, we talk generally about the fellow who makes a decision to buy a car perhaps once in 4 years, and if Detroit is particularly persuasive once in 2 or 3 years.

We welcome this afternoon men who buy in quantity. I would ask them all to come up together: Mr. Frank J. Max, vice president of Avis; Mr. Robert Smalley, president and chief executive officer of Hertz; Mr. Winston V. Morrow, president and chief executive officer of Avis, and Mr. Gordon Bowker, vice president of Ryder Truck rental.

Gentlemen, I am sorry that you have had to spend a whole day here. I think the record will be benefited by having your opinion on this.

**STATEMENT OF FRANK J. MAX, JR., VICE PRESIDENT, AVIS RENT-A-CAR SYSTEM, INC., PRESIDENT OF CATRALA; ACCOMPANIED BY JOHN MURPHY, VICE PRESIDENT OF AVIS RENT-A-CAR SYSTEM, INC., ON BEHALF OF WINSTON V. MORROW, JR., CHAIRMAN OF THE BOARD, PRESIDENT, AND CHIEF EXECUTIVE OFFICER, AVIS RENT-A-CAR SYSTEM, INC.; SOL M. EDIDIN, VICE PRESIDENT, SECRETARY, AND GENERAL COUNSEL OF HERTZ CORP., ON BEHALF OF ROBERT A. SMALLEY, PRESIDENT AND CHIEF EXECUTIVE OFFICER, HERTZ CORP.; AND GORDON BOWKER, VICE PRESIDENT, RYDER TRUCK RENTAL, INC.**

Mr. Max. Thank you, Senator.

I am Frank Max, vice president of Avis Rent-A-Car System, Inc., and president of CATRALA, which is the Car and Truck Renting and Leasing Association.

I am happy to be with, on my left, Mr. John Murphy who is a vice president of Avis Rent-A-Car System and its director of insurance and safety who will read Mr. Morrow's statement, the president of Avis; and on my right is Mr. Sol Edidin, vice president, secretary, and general counsel of the Hertz Corp. who will read Mr. Smalley's state-

ment, who is the president; and beyond Mr. Edidin is Mr. Gordon Bowker, vice president of the Ryder System, who will present a statement of his own.

CATRALA is the association of those firms and persons in the United States, the District, Puerto Rico, and Canada who are engaged in the rental and lease of cars and trucks. We have in excess of 1,500 members with the vast majority being small businessmen.

My purpose today is to convey to you the support of the board of directors and membership of CATRALA in your efforts to bring badly needed reform to our system of insurance and particularly to add our backing for the principle of a no-fault insurance system as contained in S. 945 and related bills.

Insurance is the number one problem facing our industry today. The problem is of such magnitude that it is literally forcing some companies out of business. I will not take the time of the committee to list the evils of the current so-called fault system. You know them better than I. Instead, I would like to address myself to the need for uniformity throughout the States and for immediate action.

The cost of insurance—if it can be obtained at all—has increased in recent years to the point that for many car and truck renters the expense of insurance exceeds that of vehicle or people costs. We have not sat idly by complaining. We have tried to live and work within the system by careful selection of renters and watching costs. But this is no longer feasible. Some change in the very basis of insurance is needed.

At our recent annual meeting we devoted a substantial part of our program to the problems of insurance and the membership is now totally in support of a no-fault system. In my opinion, before our meeting a good many of us were opposed to the no-fault proposals believing, as apparently others still do today, that we must make people responsible for their actions.

We also assumed that the present fault system does so. But, after an explanation by Professor Jeffrey O'Connell and other experts, our industry, understanding it for really the first time, was overwhelming in their support for the no-fault system. I suggest that an informed public will react similarly.

We think the no-fault principle is the best solution and should be adopted to the maximum extent possible. Because of this we oppose the provision in paragraph 7(A) of section (5) that would require the owner of a truck to contribute to the costs incurred by the occupants of an automobile. This is a major exception to the no-fault principle and would create inefficiencies and inequities.

On behalf of the board and the members I would like to record our opposition to any such provision. We are pleased to note H.R. 7514 introduced by Congressman Moss on April 20 omits such a feature and we support that approach and that bill wholeheartedly.

The need for uniformity throughout the United States for people in our business is so obvious that I will not belabor the point. We are engaged in interstate commerce and must have a consistent and uniform system under which to operate.

We sell mobility. Our vehicles are constantly moving throughout all of the States. I cannot describe the confusion that would result if some

States had the old tort system, others some form of no-fault and still other States something in between. It would be a disaster.

We support a uniform no-fault system, and I emphasize uniformity inasmuch as the no-fault plans introduced in several States vary all over the lot.

We also need action now. Each day we continue to perpetuate the inequities of the tort system causes more hardship and suffering. We see no reason to delay reform.

We are here because we are major consumers of insurance and we do not anticipate that a no-fault system will save us money. On the contrary, it may initially cost more, but the inherent efficiencies and advantages of such a system must eventually benefit us as it does all other automobile owners.

With the improvements and amendments suggested by my associates, I would like you to have our complete support and we stand ready to do whatever is necessary to assist in your efforts.

Thank you.

Senator HART. Good. Let's hear what those suggestions may be in addition to that business about trucks, the heavy vehicle.

You commented on the requirement that is in the bill that we filed that the truck owner contribute to the cost incurred by the occupant of an automobile, and you say no to that. Perhaps there are other specifics that you wish to make.

Mr. MAX. Yes. As a matter of fact, other gentlemen will cover this point in their statement also, Senator.

May I ask Mr. Murphy to proceed with his statement?

Senator HART. As you would like.

Mr. MURPHY. My name is John J. Murphy, vice president, insurance and safety, of Avis Rent-A-Car System, Inc., and I will read a statement of Winston V. Morrow, Jr., chairman of the board, president, and chief executive officer of Avis Rent-A-Car system.

Mr. Morrow has been out of the country for the last week or 10 days and cannot be here. However, he would like to be. His statement is as follows:

For many years during my career with Avis I have been compelled to watch as my company poured millions of dollars into the existing system of vehicle liability insurance.

While always somewhat uneasy over these expenditures it was not until the findings of the Department of Transportation were made public that I was able to focus on the thought that our millions might be going to a system of reparation that is, as stated in a DOT report, "inequitable, inadequate and insufficient, and unresponsive to existing social, economic and technical conditions."

In articles commenting upon the DOT reports many statements were made which tend to verify the above conclusions. Some very troublesome and provocative statistics that come to mind, albeit based upon fairly small samples, are that 55 percent of all severely injured people collect nothing from automobile liability insurance while those accident victims suffering less than \$500 in economic loss collect 400 percent of such loss.

While it has never been, and should not be, the goal of any automobile accident reparations system to provide full compensation for all economic loss suffered by victims of auto accidents, it does occur to me that the millions that are now being spent could be put to better use.

It is against this background that my company has determined that the basic no-fault concept, calling for prompt payment of out-of-pocket expenses and lost wages to auto accident victims, regardless of fault, through mandatory first party accident insurance, is on balance in the interest of the public and is in any event clearly to be preferred over the present system.

I am aware, however, that a growing number of States are considering various kinds of no-fault legislation, some retaining the tort system in part and some not, all with different limits for economic loss, and with many other variations.

We are most concerned and apprehensive, therefore, that, due to this appalling lack of uniformity of definition and standards, a state of no-fault anarchy would exist if the several States were to be free to enact legislation currently under consideration.

The obvious solution is Federal legislation which will create a uniform system of insurance supervised by the States but subject to the requirements of Federal law and regulations.

Accordingly, I am pleased to express my support for the principle of Federal no-fault insurance as set forth in S. 945, in the hope and belief that such legislation will correct many of the abuses, delays, and inequities inherent in the present tort insurance arrangements while at the same time eliminating this possibility of no-fault anarchy.

As presently written, however, S. 945 contains two principal defects which will need correction before the bill can fully achieve its objectives and in order that new abuses of equal magnitude are not substituted for the existing ones.

First is the provision for payment in full of reasonable medical, rehabilitative, and other expenses without further definition, limitation, or standard.

There appears to be no incentive to keep expenses of this kind within bounds and we need only to look to our brief experience with medicare and medicaid to see that the absence of any finite limits could cause this plan to be prohibitively expensive.

While the bill requires such expenses to be appropriate and reasonable, these standards could be very difficult to apply in practice, especially in view of the provision for imposing a 2-percent-interest charge if payment is not made by the insurer within 30 days.

In this connection it would certainly seem appropriate to look to the workmen's compensation systems, reinforced by clearly understandable standards, that have been successful over a period of 55 years, for a method of calculation which could be utilized in S. 945.

The second fault in S. 945 is the requirement contained in section 5(7) that larger vehicles be responsible for at least a percentage of each loss in every accident.

These provisions deviate from the no-fault concept by imposing absolute liability on certain types of vehicles for damage to others, and would thus substitute a new abuse for an old one.

Moreover, such provisions can hardly be supported in a bill which retains, as does S. 945, the tort system for so-called catastrophic harm.

I note that in H.R. 7514, the newly revised House version of a plan similar to S. 945, this section no longer appears and I would urge the committee to make a similar deletion from S. 945.

I applaud the framers of S. 945 for producing a firm proposal which, with the changes referred to above, can be the beginning of a new era in changing our institutions to better serve the public interest.

Mr. MAX. The next presentation will be by Mr. Edidin on behalf of the Hertz Corp. and its president, Mr. Smalley.

Mr. EDIDIN. Senator Hart, Mr. Smalley, the president of the Hertz Corp., is unavoidably detained in New York. I know he regrets that he cannot be here.

I have delivered to the clerk a statement of his on behalf of Hertz Corp. which I hope will be accepted in the record of this committee. Rather than read that statement I would like to make a few comments with respect to the materials contained in it.

Senator HARR. The statement will be printed in full.

Mr. EDIDIN. Hertz favors the principle of no-fault insurance which is set out in the bill before the committee. We do so for one basic reason: The public who rents our cars are entitled to this protection. No-fault is in their best interest and to coin a phrase, "What is good for them is good for us."

There are some questions and problems raised by the no-fault system and by particular pieces of legislation, including S. 945. Many of these

are mentioned in the statement which is submitted to the committee. But I am convinced that the questions and the problems are far outweighed by no-fault potential benefits.

The statement submitted by Mr. Smalley makes several basic points. First, in the application of the no-fault principle, no distinction should be made, based on the size of the vehicle or the use to which it is put.

Second, in the application of the no-fault principle, some consideration should be given to the development of standards to prevent excessive and unwarranted claims.

Third, the no-fault principle is based on the assumption that first party insurance rather than legally determined fault is the basis on which compensation will be paid. Such an assumption, it seems to us, implies a governmental obligation to guarantee that persons using vehicles will be covered.

We suggest in view of the dismal results of relating insurance to vehicle ownership that appropriate arrangements be made to require such insurance as a precondition to drivers' licenses.

All of these are covered in greater detail in the statement. I will be happy to answer any questions with respect to it.

Thank you, Mr. Chairman.

Would you like us to continue with the balance of the presentation?

Senator HART. Thank you. Yes.

Mr. MAX. Mr. Bowker will make our last statement, Senator.

Mr. BOWKER. I am group vice president of Ryder Truck Rental, whose primary business is full service truck leasing. Ryder has at the present time 37,000-plus vehicles in use. I am also a member of the board of directors of Central, which is the national organization of car-truck rental and leasing companies.

The following comments are being made on behalf of Ryder. Ryder spends over \$10 million a year to support its insurance program. Much of this cost comes about from having to defend our position in accident claims. One of our principal concerns is that only a small portion of that cost reaches the injured accident victim.

I am here today to state that we totally support the no-fault concept in principle. Knowing that several State legislatures are actively considering State no-fault insurance proposals distresses us. We honestly feel that the logical approach to such legislation should be through uniformity throughout the United States with Federal legislation that would be adopted by the individual States. We totally support uniform legislation throughout the United States and encourage the adoption of Federal legislation to assure that end.

We vigorously oppose the adoption of any bill, whether at State or Federal level, which would discriminate and apply different treatment to vehicles which are "larger than any ordinary passenger automobile." Certainly, it should be recognized that the ultimate consumer of any product bears the transportation cost of that product.

Thus, it is a logical conclusion that any discriminatory cost to the transportation industry would ultimately be borne by the consumer of the goods that have been transported. The mere ability of the commercial operator to pay should not, therefore, be considered. It is our understanding that the no-fault concept has as one of its major objectives the equitable distribution of accident claims costs. We do not understand the equity of making a commercial vehicle responsible for more than the claims cost of that vehicle.

The various workmen's compensation laws have proven over the years that it is entirely possible to schedule medical benefits and to apply certain maximums with reference to those medical benefits. An unlimited medical benefit, whether under workmen's compensation, medicare or no-fault, leaves an open end to ultimate costs which are and would be extremely difficult to predict.

We, therefore, recommend for your consideration an inclusion of some form of medical maximum limitations utilizing the schedule of benefits approach. In addition, we totally support the concept of no duplicate payments for medical expenses and loss of wages and feel that the no-fault insurance bill should include a provision to provide that payment would be in excess of other applicable insured payments.

Thank you for allowing me to be present today and present these views on behalf of Ryder and Catrala. We congratulate this committee for pursuing such a vitally important social issue.

Senator HART. Thank you, each of you, for giving us your views.

I was struck by, I think, it was Mr. Max' opening comment that your association, until it got into this subject, had the traditional feeling that we have lived with this system, maybe it isn't perfect, but no-fault must be worse, and then when you do get into the chapter and verse—am I paraphrasing it correctly—overwhelmingly your association now supports the concept of a national no-fault system with several modifications that you have indicated—the truck, heavier vehicles; some ceiling on medical cost?

Mr. MAX. That is correct, Senator.

We had our national meeting in February, in Florida, at which approximately 500 of our members attended, and we had included in that program a seminar that was conducted by Professor O'Connell, and it turned out to be the most dynamic portion of our entire 3-day program.

As a matter of fact, we held Professor O'Connell over for another day, and he met with smaller groups to discuss this subject, and there is no doubt in our minds and our board of directors' that this is so.

I put in my statement it was an education for many of us to have the opportunity for exposure to Professor O'Connell and to explore this entire concept.

Some of us, of course, had been closer to it for a longer period of time like Mr. Murphy, on my left here, who is working in this area on a daily basis.

Senator HART. I do find that section of the statement where you make this general comment. You add before the meeting a good many were opposed to the no-fault proposal believing that we should make people responsible for their actions, and somehow or other the element of insurance affects the degree to which a driver is responsible. I flew on that assumption for a long time, too, but now when you examine it, if my life depended on it, I can't cite one example in my own driving friends who have ever told me, "Except for the insurance premium my friends who have ever told me, "except for the insurance premium I would run the light." I just don't buy that assumption.

Mr. MAX. Senator, you can appreciate that we are a profit-oriented industry and we operate by dollars and cents, and we are very clearly aware in our business of the fact that 45 percent of the people who have bodily injury claims are never compensated at all. It has been

brought out by the DOT studies and in the last few hours by Mr. Klein. We are aware of this.

At first we were very apprehensive about the dollar impact of no-fault, but then in getting into depth in this subject, while we do feel that there will be an interim increase in cost, we feel that ultimately this will balance out, and with the application of requirements to build a safer automobile, restraints for people in them, and matters of this kind, that all this being put together, we ultimately will develop more reasonable costs.

Senator HART. Are you saying, to make it more specific, that as the car is produced it has greater absorption and restraints which are—what do they call it—negative restraints?

Mr. MAX. Passive restraints.

Senator HART. That this will save you money.

Mr. MAX. Oh, there is no doubt about that. No doubt in our minds because, as I say, we work on a daily basis and we are clearly aware of the fact that a comparatively minor accident results in damage to an automobile that can amount to several hundred dollars. I think there have been studies on this at less than 5 miles an hour, something like \$250 of damage is performed. We are in this arena every day.

Mr. EDIDIN. Senator Hart, if I may be permitted a comment, in addition to my hats with the Hertz Corp., I am a member of the National Motor Vehicle Safety Advisory Council, where we consider many of the problems associated with the vehicle that I think you may be concerned with.

We conceive of the possibility, looking to the future and being responsible on a first-party basis for people within our vehicle, that a safer vehicle may enable us to realize a significant saving in insurance costs down the line. We don't see that possibility under the present system, the present tort system.

Senator HART. Even if the vehicle construction improved?

Mr. EDIDIN. Even if the vehicle construction improves, it may be of some help to people within the vehicle, but there is always the question of people outside the vehicle. First-party insurance, as I understand it with respect to this particular bill, concentrates with respect to people in our vehicle.

Senator HART. Several of you have spoken about the desirability of having a uniform national no-fault program. Conversely, somebody said it would be a disaster or a horror if there was a mixture across the country, and you cite the fact that you do business in several States; you are a vehicle renter across State lines repeatedly. Really that is true almost equally of the individual, is it not, whether engaged in the rental business or not?

In Detroit we live very close to a State line anyway, but many, many people either live close to a State line—some of them daily cross a State line—and in almost all cases on vacation or otherwise will reasonably be expected to move into two or three States.

Mr. MAX. Absolutely. Certainly in recent years since the Federal highway system has been expanded, our people, the individual is more mobile than ever before, and every individual—it is not just the people in our industry, we are speaking generally about all citizens—would be confronted with this same problem. I think Mr. Murphy of our company who is very familiar with this Massachusetts

situation we are in at the present time could perhaps make a comment on that situation.

Mr. MURPHY. I thought I would try to be responsive to Senator Hart's comment about the fact that we are consumers and we are not really different from the mass of individual consumers.

I think this is completely right. But the reason I think Mr. Edidin brought up the point that we would probably expect to benefit a little bit ahead of the individual consumers is we are a business where we will always have new cars, and as the passive restraints and bumpers come out, we would like to be responsible only for the environment that we control. So we think we will have the new cars 100 percent in our fleets probably a little bit ahead of the general public which takes time to turn over. For that reason, we are unique only to the extent that we will get there first in using all of the advantages of the new environment that you are giving us.

You see you are giving us a better physical environment, mechanical environment, and legal environment. We will benefit probably first in that area because our environment will have all of your advantages prior to the general public. We are not unique, we are merely going to be first. That is why we support you.

As for Massachusetts, I am a Massachusetts lawyer, I am not apologizing, and for 10 years I taught at Boston University and for 10 years I was a claims adjuster. I think the present Massachusetts law will work wonderfully for Massachusetts. I am very pleased you are not sponsoring such a law here. It is not a no-fault law there. It is a tort law. It has all the expenses of subrogation even in minor cases. But when one realizes that 82 percent of the people in Massachusetts for claims have counsel, 30 percent in Michigan, you realize there can be a great deal of improvement in Massachusetts on the law that they have.

It would appear also that Massachusetts law might rank with polio vaccine in clearing up the condition of what is known as Massachusetts back, but I don't think it is a model law for you.

Senator HART. I am so parochial, I don't get it. What do you mean by Massachusetts back?

Mr. MURPHY. It was a lumbosacral strain that everybody had in every accident to prove a back injury. It was always worth a couple of hundred dollars over a 10-year period, and now it will be cured by this no-fault, but it won't apply to every State.

Senator HART. My ignorance would suggest I haven't been a claims adjuster, a professor at Boston College or a practitioner in this field.

Mr. MURPHY. I merely point out that because I think your bill is much preferred above the tort approach in Massachusetts, even though that may be wonderful for Massachusetts.

Senator HART. I have just been given a statistic which is sobering, but very much in point, on the mobility that argues for the uniformity. I am told that of the total deaths as a result of automobile accidents, 12,000 involved people who were killed out of their State of residence, that is a pretty harsh underscoring of the necessity for a clearer understanding that we move around an awful lot in cars.

Mr. MAX. That's right. Senator, in our industry, we account for several hundred thousands of daily rental automobiles. All of these vehicles move over State lines, and you are probably familiar with the

expression, "Rent it here and leave it there," and perhaps 50 percent of all rentals in our industry are rentals where a man rents the car in one city and leave it in another city at the termination of the rental.

In some cases that city of termination of the rental may be within the State where it was originally rented, but in most cases it is over the State border. And this activity is growing constantly every year. It is an accepted service in our industry that is sought for by the public.

So, this would create as we say a positive disaster for our industry if we had a vehicle that was registered in the State of New York and had an accident in Connecticut or Vermont or New Jersey, all of which are contiguous in that area and other nearby States where they don't have to drive over in some cases less than 100 miles to be over the State line of four different States.

It is a very common situation, and we just shudder when we think of the application of variations of the Massachusetts law of a vehicle registered in the State of Massachusetts and going over into the State of Vermont or the State of New York and having an accident in that State, what sort of insurance laws are going to apply under a tort system and under a no-fault system or something that is in between.

The adjudication or responsibility itself would be an extremely complex matter.

Mr. EDWIN. Quite aside from the legal question, I shudder to think what would happen if one of our counter people tried to explain this to somebody: This is what happens to you if you have an accident in New York and this is what happens to you if you have an accident in New Jersey. If it is slow moving now, it is going to be terribly slow moving in terms of getting their car out of there. It would help us if there were a uniform system.

Mr. MURPHY. I would like to make Senator Hart's point again. We keep talking about our industry. In truth the industry doesn't drive our cars. All our cars are driven by the general public. We don't have anybody driving cars. You are driving our cars.

Senator HART. I hope very much that the Congress can be persuaded to recognize the desirability of a no-fault system, second, that we take the action at the Federal level and avoid the complications that you very vividly explained to us.

If we do that, I think it will be in large part because you have made it so understandable for us.

Gentlemen, thank you.

Mr. MAX. Senator, assisting you in your efforts and your committee in this is helping ourselves, because without it we will have chaos on our hands.

Senator HART. And Detroit would sell fewer cars. So you are helping me there, too.

Mr. MAX. I understand there are almost 20 no-fault bills up before State legislatures at the present time. I shudder to think of all the possible variations to the Massachusetts bill that are up there.

How can we ever operate with these vehicles registered in one State and having accidents in others?

Senator HART. Staff tells me the current count is 29 bills, each one different.

Thank you.

(The statement follows:)

## STATEMENT OF ROBERT A. SMALLEY, PRESIDENT, THE HERTZ CORP.

Mr. Chairman, and members of the committee, my name is Robert Smalley and I am the President and Chief Executive Office of The Hertz Corporation. Hertz is engaged in many aspects of the rental and leasing of personal property, primarily the rental and leasing of motor vehicles—cars and trucks. We are headquartered in New York, but Hertz operations are carried on in every state of the union and in over 100 foreign jurisdictions. Obviously, in view of the size of our vehicle fleet and with our far-flung operations we're enormously interested in any aspect of insurance costs and certainly in the kind of situation represented by a studied and general approach to a change in the basic concept of liability under which we've carried on our business for so many years.

I've listened with great interest to the statements made on behalf of CATRALA, of which we are a member. I'd like to add my approval to what has been said.

I don't want to say that I have read S. 945 all the way through. As a practical businessman, I usually leave this task to others—to specialists more versed than I in the intricacies of legislation—particularly legislation dealing with such an arcane, complex subject as insurance. But I have read enough of this bill and have discussed it sufficiently with specialists in the area to know that it is bold in concept, broad in scope. And yet its central theme—swift compensation of auto accident victims for economic loss, regardless of fault, through first-party insurance covering everyone involved—is simple and readily understood. I think we are on the threshold of a new era in legal techniques for dealing with an old problem—much like the era that began a half century ago with the adoption of workmen's compensation laws in the various states.

I will return to S. 945 in a few moments to offer some concrete observations and one or two suggestions I hope you will consider. But first, Mr. Chairman, let me digress briefly to touch upon some facts about our business that will show why no-fault legislation is so important to us.

It all began with the automobile, of course—the marvelous machine that has given us 20th Century Americans fantastic mobility and freedom, as well as monumental problems. I won't venture to say whether our relationship with the automobile is a passionate love affair or a marriage of convenience. Whichever it is, we and the automobile are clearly stuck with each other, for better or worse.

The connection between renting someone a car and providing him with insurance goes back to the beginnings of the business. In the early days, people who rented cars often did not own one. And of those who did own cars, few carried liability insurance to cover injuries to third parties resulting from an accident with the rented vehicle. And so it came about that Hertz provided liability insurance for every customer as a part of its rental contract.

Over the years, this insurance has been greatly broadened and improved. Today, Hertz and other major national companies provide their vehicle rental customers with liability coverage which is primary with respect to all other insurance. That is, the insurance on the rented vehicle must be exhausted before the customer's own insurance is called upon. Our industry took genuine pride in these advances, and believed a kind of zenith had been achieved in the realm of car rental insurance. Little did we know what lay ahead.

Until publication of the Keeton-O'Connell Basic Protection Plan in 1965, scarcely anyone would have predicted that in so short a time the liability insurance system itself would be scrutinized and found wanting. With astonishing swiftness, government, the professions, and the insurance business have all mobilized to re-examine and question the very foundation of the entire structure. I refer, of course, to the tort doctrine, which makes recovery of damages entirely contingent upon the presence or absence of fault in the legal sense. In my opinion, Mr. Chairman, the far-reaching and intensive study of this question by your Committee, as reflected in S. 945, has removed all doubt that the no-fault concept, intelligently implemented, is socially desirable and possesses clear advantages over the present system.

As originally drafted, the bill contained one feature that we are adamantly opposed to—the section according different treatment to vehicles "larger than an ordinary passenger automobile". In our view, this would impose an unfair and discriminatory economic burden upon owners of trucks and other commercial vehicles. I hope that the Committee is considering the removal of that feature of the bill, and I strongly urge that you do so, as it is unwarranted and unnecessary. Commercial vehicles carry the goods and the finished products used by every man, woman and child in the country—the cost of their operation is

borne by everyone in the prices paid for the essentials of life. It would be unwise and unfair to use the no-fault concept as a device to shift to the general consuming public a disproportionate share of the costs of vehicular accidents. That commercial vehicles will bear *no less* than their fair share of the burden is assured by the bill's preservation of the right to sue for damages in cases of catastrophic harm. In that respect, I should point out that the House Subcommittee on Commerce and Finance, in considering the companion bill to this one, H.R. 4994, has agreed with contentions made for this position and in H.R. 7514 has corrected the departure from the no-fault principle which the discriminatory singling out of commercial vehicles entailed.

Before leaving the subject of costs, I offer two further observations. Cost, after all, is just as crucial to the success of the program embodied in S. 945 as it is to the survival of any private business.

My first point relates to costs in the aggregate. If I understand the bill, it places no limit on the hospital, medical, rehabilitative and related expenses that can be recovered, save only that they be "appropriate and reasonable expenses necessarily incurred". I am sure the use of this language presupposes a proper review of all claims to be sure the standards of appropriateness, reasonableness and necessity are met. However, the bill also mandates that all payments for net economic loss be made "as such loss is incurred", and imposes a penalty of 2% a month on payments delayed over 30 days after receipt of "reasonable proof of the fact and amount of loss realized". Considering the volume of claims the system will have to process, I would ask the Committee to consider whether there may be insufficient opportunity for scrutiny of excessive or unwarranted claims.

The uncertainty of recovery under the present tort system and the delay in recovery of payment inherent in it tended to keep such costs down, particularly in view of the fact that the claimant or his doctor was making the outlay. While that system unquestionably did injury in many cases, removal of all of the restraints may act to sharply increase the costs of what is regarded as appropriate or reasonable expenditures. Some constraint is required, as some of our recent experience with medicare indicates, to prevent the costs of what is otherwise a fine program, from overrunning what society is willing to pay. The principle of what I'm talking about is seen in this very bill in terms of the amount awarded for loss of earnings. The 85% of earnings limitation is just the sort of gentle compulsion on an individual that I have in mind as a principle to be applied with respect to medical costs. Many insurance policies handle this by way of an initial deduction or an overall limitation. I do not suggest that, since I fully appreciate the importance of assuring prompt reimbursement for medical and related expenses, as a primary goal of the entire no-fault approach. It occurs to me that our collective experience under state workmen's compensation laws may contain valuable clues to attainment of both objectives here—prompt payment *and* proper control. We now have, as I mentioned earlier, a 50-year accumulation of statutory and administrative precedent under these laws, which can be seen as the direct lineal ancestors of the automobile no-fault plan we are discussing today. Accordingly, I would urge the Committee to draw on our successful experience with workmen's compensation in the event it shares my uncertainty over the question of costs.

My second observation looks more to the future than to our immediate concern, and relates to the peculiar—perhaps unique—situation of vehicle lessors. As I mentioned earlier, the history of our business has ordained that our customers receive insurance coverage as a part of the total vehicle rental package. And as the owner of the vehicle, we would provide the first-party accident insurance called for by S. 945 presumably on the same basis. Unlike the insurer of the family car, however, there is no way in which our insurer can rate our customers as individual risks when we put them behind the wheel of our vehicle. The result is that in a rental vehicle, the best risk incurs the same cost for coverage as the poorest.

We think the time is not far off—it may be here already—when it will be practicable to require that every holder of a driver's license bear the responsibility of maintaining his own individually rated automobile accident insurance, both first party and liability. In other words, the American insurance system should insure the driver, not the car. This may be the only way by which we can avoid the problem of the uninsured motorist. Figures I've seen indicate that, even in the District, a large percentage of vehicle owners carry no insurance. The only way I would think of reducing if not eliminating the problem would be for each driver to show evidence of insurance at the time he got his driver's license.

The vehicle owner would still be required, of course, to carry excess or supplemental coverage so there would be no gaps, but the driver's own insurance would be primary regardless of whether the accident occurred while he was operating his own vehicle, a friend's, or one of ours. I urge the Committee to consider the merits of this proposal, for such an arrangement is truly more logical than the practice of relating the obligation to maintain insurance to ownership of a particular vehicle, instead of to possession of an operator's license.

I have saved for the last that feature of the bill which evokes my warmest enthusiasm and support—uniformity throughout the land. A fundamental change in automobile insurance such as that represented by the no-fault concept cannot, in my judgment, be rationally introduced except under pre-emptive federal law such as S. 945, or at least under standards requiring substantial uniformity from state to state. Consider, for example, the utter chaos we would face in our business if the traveler who drives his rental car through two or three states in the course of a single trip must be covered for no-fault in one, liability in another, and a combination of the two in a third. Even assuming we ourselves will understand what we are doing, I blanch at the thought of explaining to a harried customer the varying coverages required under conflicting or inconsistent state laws. The same will be true, although to a lesser degree, in the case of the private vehicle owner. In this respect, there is no analogy to workmen's compensation, for a job site is fixed, whereas an automobile represents the ultimate in mobility.

Mr. Chairman and Members of the Committee, I deeply appreciate having had this opportunity to present my views on this vital subject, and thank you for your attention. Once again, I salute you for your outstanding contribution to the reform of our automobile accident compensation system.

Senator HART. The committee stands adjourned to resume at 10 o'clock tomorrow in this room.

(Whereupon, at 4:40 p.m., the hearing was adjourned, to reconvene at 10 a.m., Tuesday, May 4, 1971.)

O

U.C. BERKELEY LIBRARY

U.C. BERKELEY LIBRARY

wise not available, legal avenues and obligations are continued or revived.

We estimate at least 80 percent of claims for personal injury will be closed completely on a no-fault basis—fast, fairly, efficiently. Many others will recover most of their losses this way and in installments, as losses are suffered, and at a time when help is most needed.

One benefit is gone—the restriction on an injured party's right to recover more than he actually lost, in the name of damage for pain and suffering. That, of course, is how cost is reduced.

Various deductibles are available, leaving coverage decision to the consumer, not the insurance company.

Trial lawyers claim denial of the right to pain and suffering recovery deprives the individual of due process. We believe people want cheaper auto insurance and are willing to give up certain rights to get it—rights like duplicate payments and pain and suffering awards.

No-fault is under court challenge this very week in Massachusetts. We believe it will be held constitutional. If it is not, we will not return to the old system: we will turn to a State fund for auto insurance, if we must.

We are going to provide better auto insurance in Massachusetts. We want to end sale of double and triple recoveries for some injuries and to end compulsory coverage for pain and suffering. Nothing in our law prevents drivers from such purchases. But our larger goal is to provide protection to those more concerned with low cost than with cashing in on the misfortune of accident.

We've made a good start in Massachusetts—but we have a distance to go, and we need much more help from the industry than we've had. We have evidence some companies have failed to inform consumers that optional deductibles are available to them to reduce their total cost. We even have evidence some companies have refused to sell such deductibles. We have evidence some companies have forced customers to buy more property damage insurance than they want—or go without any auto insurance.

Such policies profit the companies, of course. But they grievously penalize the motorist. Let me illustrate.

In money terms—a driver in Boston with a single car and a son under 25 have various options open to him:

Full coverage of \$25,000 and \$50,000 bodily injury and \$5,000 property damage at a cost of \$565 a year. Incidentally, last year, before no-fault, that cost was \$600, and this year, without no-fault, that cost would have been \$725 or more.

A \$1,000 deductible for himself and his family would cost \$491, a savings of \$75.

Add to that a \$200 deductible on property damage and the premium drops to \$432, saving \$134.

Add in the full deductibles available and the cost could drop to \$418—nearly \$150 in savings a year.

Finding companies that will explain such options to a customer let alone sell them to him is no small task today in Massachusetts—and we may need tougher laws to force the industry to offer methods of making good on the promise of lower costs that no-fault holds out. If the still-accumulating evidence shows that we do, I will file such legislation. And we are already looking at ways to improve our rate-

U. S. CONGRESS. SENATE.

# AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

## HEARINGS . . .

BEFORE THE

## COMMITTEE ON COMMERCE UNITED STATES SENATE

NINETY-SECOND CONGRESS

FIRST SESSION

ON

**S. 945**

UNIFORM MOTOR VEHICLE INSURANCE ACT

**S. 946**

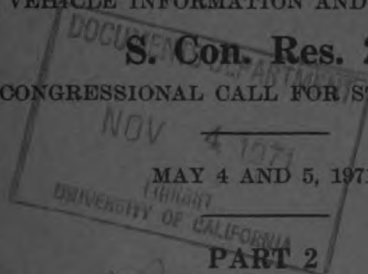

MOTOR VEHICLE GROUP INSURANCE ACT

**S. 976**

MOTOR VEHICLE INFORMATION AND COST SAVINGS ACT

**S. Con. Res. 23**

CONGRESSIONAL CALL FOR STATE ACTION

Serial No. 92-18

Printed for the use of the Committee on Commerce

U.S.S.D.

"Translated into possible future premium reductions that comes out to a further premium cost cut of 25 percent for bodily injury insurance, though not property damage and collision for in those years price inflation and the high cost of auto repair drive these costs steadily up," Gov. Sargent said. "But in bodily injury, the only area affected by no-fault, we can at least hope for further cost cuts if present experience continues."

Gov. Sargent said he would release a statistical summary next week on the first three months of the first in the nation no-fault system.

"The great irony of no-fault so far is that the industry that fought it so hard is now profiting the most from it," said the governor. Further, the industry, while it profits, blocks the consumer from the benefit of the new system, he said.

Gov. Sargent told the insurance men they were keeping the public ignorant about how to take advantage of savings on auto insurance premiums.

"Last year we provided options in auto insurance to let the buyer build his own insurance program through bodily injury deductibles for those with sufficient health insurance," he said, "and \$100 and \$200 deductibles in property damage insurance."

"We encouraged companies to provide further deductibles to cut cost of collision and comprehensive insurance," he said.

"I am told the industry in some cases has not only failed to inform customers of these options but has actually refused to allow their purchase," Gov. Sargent said. "Worst of all, I am told that many companies have forced customers to buy more insurance than they want in order to buy any at all."

Gov. Sargent said he would order a "step up in investigation of the abuses so far charged—and the industry had better be ready to reply."

Senator HART. Our next witness, and we welcome him, is the executive director of the American Association of Motor Vehicle Administrators, Mr. Louis Spitz. Mr. Spitz is accompanied I understand by their director of public information, Mr. Robert Brown.

**STATEMENT OF LOUIS P. SPITZ, EXECUTIVE DIRECTOR, AMERICAN ASSOCIATION OF MOTOR VEHICLE ADMINISTRATORS, WASHINGTON, D.C.; ACCOMPANIED BY ROBERT S. BROWN, JR., DIRECTOR OF PUBLIC INFORMATION**

Mr. Spitz. Thank you, Mr. Chairman.

I am very pleased to be afforded this opportunity to present to this distinguished committee the comments of the American Association of Motor Vehicle Administrators on S. 976—the Motor Vehicle Information and Cost Saving Act—jointly sponsored by Senator Hart, yourself, and your distinguished colleagues from Indiana, Maine, Wisconsin and Connecticut.

The apparent intent of S. 976 is well-aimed. A legislative measure which is designed to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage, indeed aspires to a popular cause—popular with the motorist and consumer. Such competition is one of the basic underlying factors of a free-enterprise system.

By way of introduction, I am Louis P. Spitz, executive director of the AAMVA—a post which I have occupied for the past 4 years. Prior to that I was a director of the Nevada Department of Motor Vehicles for 8 years; and with the Reno, Nev. Police Department for 18 years. Three decades of my life have been dedicated to protecting the safety and well-being of motorists on our Nation's highways; and protecting the interests of the motoring public.

Therefore, I am delighted to review and offer my comments on any measure seeking to save lives—whether it be by elimination of acci-

dents or by assuring that if accidents occur that passengers and property will be less likely to be injured, killed or damaged.

It is my understanding that, if enacted, this very broad legislation would amend the National Traffic and Motor Vehicle Safety Act of 1966 to do the following:

Require that all cars manufactured after July 1, 1974, have a bumper that can withstand a five-mile-per-hour collision into a solid barrier with no damage.

Require manufacturers to rate their cars by their relative susceptibility to damage in low speed collisions.

Provide for establishment of a nationwide system of diagnostic inspection systems, for inspection of cars before consumers buy them and after crash repairs are made.

Require a uniform titling standard which includes a history of ownership—a family history—of each car.

Furthermore, S. 976 would apparently broaden the National Highway Traffic Safety Administration's mandate—contained in the National Traffic and Motor Vehicle Safety Act of 1966—to include promulgation of property loss reduction standards in addition to motor vehicle safety standards.

The American Association of Motor Vehicle Administrators is the association of State and Provincial officials responsible for the administration and enforcement of motor vehicle and traffic laws in the United States and Canada. Our association, quite naturally, has an intense interest in safe motor vehicle travel on our highways.

The feature in S. 976 that would require front and rear bumpers on 1975 model autos that would withstand a 5-mile-per-hour, car-to-fixed-barrier collision with no body damage, obviously is addressed to the loss reduction concept.

This comparatively new concept seeks not merely the limited goal of highway crash prevention per se, but, in a departure from traditional highway safety rhetoric, the wider goal of highway loss prevention by whatever means seems to work best.

This highway loss reduction concept has been gaining increasing popularity among safety professionals since the release of results of tests by the Insurance Institute for Highway Safety which showed that when four popular sedans were crashed into a solid barrier at 5 miles per hour, they averaged about \$200 each in damage. I believe that these test results originally were announced by Dr. William Had-don, Jr., president of the Insurance Institute for Highway Safety, in testimony before Senator Hart's Judiciary Subcommittee on Antitrust and Monopoly Legislation, during the hearings on auto repair costs. I assume that this provision in S. 976 is as a result of those auto repair hearings; and probably that specific testimony.

Loss reduction has received increasing attention from AAMVA's member States. There currently are two States which have enacted bumper legislation—the State of Florida during 1970 and the State of Maryland during the recently completed 1971 legislative session. More than 30 States—33 if memory serves me correctly—have considered measures related to bumper stability at low-speed impact during the 1971 legislative year.

The Federal Department of Transportation also has already acted to a limited extent in this area. On November 24, 1970, the National

Highway Safety Bureau—now known as the National Highway Traffic Safety Administration—issued a notice of proposed rulemaking on exterior protection of passenger cars.

Subsequently, DOT has issued an exterior protection standard which will provide for protection against damage to a limited range of safety-related equipment in 5-mile-per-hour crashes of front ends of vehicles, beginning with 1973 model year production; but only in 2.5-mile-per-hour crashes of the rear ends.

There are some differences in specifications between the Federal and State enacted provisions. Also, there apparently is a disagreement between State legislative leaders and the Department of Transportation over the preemption provision of this new DOT standard.

It is my understanding that the DOT is of the opinion that, once its standard takes effect, the State laws will become null. However, I also understand that this is based on an in-house opinion.

As is the case with most of the other highway safety and motor vehicle standards, it appears to AAMVA and its member States that ultimate enforcement of this standard will be left up to the State. Therefore, it would seem to us that if we are to have a Federal law, or Federal standard, that it should be confined to broad general guidelines. If the Secretary of Transportation is to promulgate the specifics of such a standard, we feel strongly that it should be in close consultation with the States; and, taking into consideration already effective State regulations in this matter.

It is difficult for States to retain a high level of enthusiasm and commitment for highway safety programs when, after expending a great deal of time and in some instances a great deal of money, they discover that shortly after their action that it is preempted by a Federal act. It is particularly discouraging when they discover that implementation of the Federal provision will require a substantial cost; and that the Federal law, in some instances, is not as strong as the State-enacted measure.

The provision in S. 976 that would require cars to be related for their relative susceptibility to damage in low-speed collisions is not primarily a safety-oriented consideration; but appears it would be of substantial interest to the consumer.

Since the damage susceptibility rating would apparently be based on a cost consideration, this matter would be of the greatest interest to those charged with the administration of consumer affairs, although there would be at least some loss reduction interest in this type of information. It could, quite logically, have a substantial influence on a consumer's decision in selecting an automobile, if such information were available.

I have offered comments previously, before Senator Hart's Judiciary Subcommittee on Antitrust and Monopoly Legislation, regarding diagnostic inspection of motor vehicles. My comments are contained in part 4 of the hearings on the automotive repair industry, held March 17-19, 1970, beginning on page 1774.

AAMVA still, Mr. Chairman, has reservations—such as expressed in the 1970 hearings before Senator Hart's subcommittee—about the probable high cost factor connected to installation of a State diagnostic system in any jurisdiction except Delaware, the District of Columbia, and New Jersey—the three with State-owned inspection sta-

tions. It very possibly could have the effect of pricing out of operation the 23 States which currently have programs with State-appointed inspection stations.

Another inspection-related provision in title 5 of S. 976 causes AAMVA some concern. It is the provision which states:

"No motor vehicle inspector may be certified by any state if he owns or receives any benefit in or from a business, or enterprise engaged in the repair or sale of motor vehicles, automotive repair parts, or accessories \* \* \*."

From a philosophical standpoint, such a proposal is sound. However, from a practical standpoint, we feel that such a standard in inspection would seriously jeopardize the programs in all 23 States where there is a State-appointed inspection system. We realize that there is a provision for areas of low population density; but we still feel that this provision would cause an adverse effect on a substantial number of inspection programs.

One other thing which I would like to note in passing is an apparent change in the thinking of the distinguished Senator from Michigan on the matters which we are addressing today. In a Detroit speech to the Society of Plastics Engineers on January 19, 1970, when this particular legislative program was outlined, Senator Hart stated that he felt that most of his plan could be accomplished without new Federal legislation.

Well, in view of the five bills connected with this package—including the broad proposals in S. 976; the national no-fault insurance proposal in the Uniform Motor Vehicle Insurance Act, S. 945; and the safety and consumer-related features of S. 946, S. 947, and S. 948; we at the AAMVA are certainly relieved that this was not a matter that would have required a substantial amount of Federal legislation.

However, there are several features in title 5 of S. 976 which appear to AAMVA to have considerable merit.

One in particular is the provision in section 502, paragraph B, which will enable the Secretary of Transportation to provide the States with financial incentive programs for establishing—if this bill is enacted—the inspection and tilting standards' provisions prescribed.

AAMVA feels that this discretionary 10 to 50 percent financial incentive, to assist States in underwriting the annual costs of such programs, is a far superior approach to the somewhat distasteful 10-percent-penalty provision for State noncompliance with the original 16 highway safety program standards.

(The following press release explains progress today by the States in implementing highway safety standards:)

Secretary of Transportation John A. Volpe has sent letters to the Nation's Governors telling them how their States rank and compare with all other States in their compliance with 16 Highway Safety Program Standards.

Under the Highway Safety Act of 1966, the States are responsible for carrying out highway safety programs to implement Federal Standards developed by the National Highway Traffic Safety Administration, and issued by the Secretary of Transportation.

In issuing a report card to the States, Secretary Volpe said:

"Ideally, all States should be fully implementing the highway safety standards . . . In my continuing review of the status of highway safety around the country, I find some advances and unhappily, some retrogression.

"As a former governor, I am of course fully appreciative of the problems in enacting your legislative programs and implementing and financing them. But the attack on highway deaths and accidents must be pressed without pause.

# AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

TUESDAY, MAY 4, 1971

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
*Washington, D.C.*

The committee met at 10 a.m., pursuant to recess, in room 5110, New Senate Office Building, Hon. Philip A. Hart, presiding.

Present: Senators Hart, Moss, Cook, and Stevens.

Senator HART. The committee will be in order.

We are resuming hearings this morning on S. 945, S. 946, S. 976, and the Senate Concurrent Resolution 23.

Yesterday the testimony that we received supported generally a national no-fault approach. From Puerto Rico we heard from Mr. Fournier. He explained how the no-fault approach there had performed successfully. From Consumers Union we heard Mr. Klein testifying for that organization, and the Consumer Federation of America, both support S. 945, S. 946, and 976. And representatives of the Car and Truck Rental and Leasing Association expressed their general support of a national no-fault approach.

Today's testimony promises to offer a different perspective. Unfortunately the distinguished Governor of Massachusetts, Governor Sargent, called late yesterday afternoon—actually early last night. He described circumstances which had developed in Massachusetts which compelled his staying there. But Mr. Jackson will present the Governor's statement.

In view of Governor Sargent's absence, I would suggest that any questions we would want to address to the Governor be submitted in writing.

Senator COOK. I agree, Mr. Chairman.

Senator HART. Mr. Jackson, good morning.

## STATEMENT OF JOHN JACKSON, WASHINGTON REPRESENTATIVE FOR THE COMMONWEALTH OF MASSACHUSETTS, ON BEHALF OF HON. FRANCIS SARGENT, GOVERNOR OF MASSACHUSETTS

Mr. JACKSON. I am John Jackson, Washington representative for the Commonwealth of Massachusetts. I apologize for my Governor not being here this morning. He has agreed if you submit questions he will answer them for the record.

I will read his statement:

I am here today in two capacities—and both pleased and honored to be.

I am here on behalf of the National Governors' Conference, and in that capacity—and at the outset—I would like to report that body's

Staff member assigned to these hearings: S. Lynn Sutcliffe.

point of view. The conference has endorsed the concept of stated regulation rather than Federal regulation of auto insurance. It has taken no position on the question of the no-fault approach to auto insurance. For my own part, I share the view that it is desirable to permit the several States to design, test and evaluate various approaches to insurance reform. I believe that evaluation will result in adoption of the no-fault concept and that from the varied experience of many States will come solid ideas that will benefit all of us, perhaps more than single Federal program would.

In my capacity as Governor of Massachusetts, the first American State to put a no-fault plan into effect, I would like to share with the committee the Massachusetts experience to date. To do so will require a look backward and a look ahead, for both perspectives are part of that experience.

No-fault came hard to Massachusetts. The ideas were debated 4 years—and trial lawyers and insurance companies blocked insurance reform throughout that period. Today, the trial lawyers remain opposed, but some of the insurance companies favor the plan.

The final bill, as I received it, was a piece of goods damaged in transit through the legislative process. Those no longer able to defeat the bill, did manage to cripple and distort it.

But after 40 years of a bad system, I had the chance to sign at least the basis for a good one—and I did so. However, those insurance companies that had come to support the no-fault concept, threatened to quit Massachusetts because of defects in the legislation. We corrected those defects with additional legislation, the companies remained to do business—and the first-quarter results are now in.

They are striking.

Costs have been cut to the consumer. Instead of rate increases of 20-30 percent that would have gone into effect, we cut bodily injury by 15 percent for both compulsory and noncompulsory coverage. Further, motorists had the choice of deductibles to reduce their costs from 6 to 30 percent more. Finally, rather than increases that were asked in medical payments insurance, we were able to make it an excess coverage and cut its rate by 25 percent over last year.

Our insurance commissioner had to approve increases in property damage rates for this year—but the no-fault bill was not involved. And in this area, we directed companies to offer options of \$100 and \$200 deductibles for property damage insurance. More, I am backing the triple option approach to property damage this year to provide more choice for those insuring their vehicles.

So, we have succeeded in first stopping and the reducing the previously steady annual rise in auto insurance costs.

And a 3-month statistical study of no-fault results show the future cost of auto insurance can be slashed further.

The actual number of claims for injuries made to insurance companies in Massachusetts during the first 3 months of no-fault operation has dropped a startling 60 percent. Field examination of those claims—14,218 of them—show that the average amount paid out for injuries has also dropped—in this case 36 percent. Plainly those facts mean future insurance cost cutting.

The study also shows a speedup in the rate of claim payments. For it indicates that payments have been made on some 12 percent of the

claims reported in these 3 months compared to a payment rate of under 5 percent in the same period a year ago. And, our study shows no-fault is paying more of the injured reporting claims in that a higher number of the accidents have produced more than one no-fault claim.

All this information comes from actual examinations of the claims reports made to companies in these 3 months.

Other data from our registry of motor vehicles first of all shows that the number of accidents are up this year over last. But nearly 33 percent fewer people involved in them are reporting bodily injury while some 47 percent more are indicating to the registry that the accident resulted in damage to property of \$200 or more.

It's too soon to tell what these figures mean. It has been said that the best way to get fast settlement for car damage is to claim bodily injury. Maybe, now that a bodily injury claim is made to one's own company, people have stopped making injury claims to speed repair of a damaged vehicle. If insurance companies settled property damage claims as they should, that would be one thing. I'm dubious—and, as I did last year, I'll try to reform our property damage system too.

Another possibility is that people don't understand their right to quick medical expense payment under no-fault. The industry hasn't helped much in that regard. Along with threats to leave the State, a barrage of press releases, the mailing of cancellation notices, the industry, despite pious claims to the contrary, did not break its neck to educate the public to a new system. We need a better education program on the new plan.

Claim costs are down 36 percent so far over last year's first quarter, and we have reason to hope for premium cuts next year. But there's more to no-fault than that.

Auto accidents killed 56,000 people in 1969, injured 4½ million more and cost \$16.5 million dollars. Our legal system leaves to tort or fault law the decision as to which of the injured shall be compensated. Finding someone who was at fault is crucial to the decision.

The question is not—who was hurt—but, rather, who was in the wrong. Auto insurance has been designed to provide financial protection to a driver who may wind up at fault, and, therefore, financially liable. Our premise, and it has been so for 43 years in Massachusetts, has been that auto insurance should help the injured by guaranteeing the possibility of compensation, though requiring establishment of who was at fault.

No-fault eliminated the need to find a villain. It does not require someone be found who is to blame in order to permit the injured to obtain compensation.

Let me highlight the Massachusetts plan for you. First, all coverage and protection provided by the old plan is still provided. Simply, we've added a wider medical payments type of coverage on top of compulsory liability insurance. Then, through a tort exemption we've made that coverage the primary and sole source of recovery for the first \$2,000 of loss sustained by injured accident victims.

The injured will look first to the no-fault coverage on the car they are occupying for hospital, medical, and lost wages (or its equivalent) expenses. Where such coverage is open to them they will have no right to litigate for loss recoverable on a no-fault basis. But where loss exceeds the \$2,000 per person limit, includes other losses, or are other-

wise not available, legal avenues and obligations are continued or revived.

We estimate at least 80 percent of claims for personal injury will be closed completely on a no-fault basis—fast, fairly, efficiently. Many others will recover most of their losses this way and in installments, as losses are suffered, and at a time when help is most needed.

One benefit is gone—the restriction on an injured party's right to recover more than he actually lost, in the name of damage for pain and suffering. That, of course, is how cost is reduced.

Various deductibles are available, leaving coverage decision to the consumer, not the insurance company.

Trial lawyers claim denial of the right to pain and suffering recovery deprives the individual of due process. We believe people want cheaper auto insurance and are willing to give up certain rights to get it—rights like duplicate payments and pain and suffering awards.

No-fault is under court challenge this very week in Massachusetts. We believe it will be held constitutional. If it is not, we will not return to the old system: we will turn to a State fund for auto insurance, if we must.

We are going to provide better auto insurance in Massachusetts. We want to end sale of double and triple recoveries for some injuries and to end compulsory coverage for pain and suffering. Nothing in our law prevents drivers from such purchases. But our larger goal is to provide protection to those more concerned with low cost than with cashing in on the misfortune of accident.

We've made a good start in Massachusetts—but we have a distance to go, and we need much more help from the industry than we've had. We have evidence some companies have failed to inform consumers that optional deductibles are available to them to reduce their total cost. We even have evidence some companies have refused to sell such deductibles. We have evidence some companies have forced customers to buy more property damage insurance than they want—or go without any auto insurance.

Such policies profit the companies, of course. But they grievously penalize the motorist. Let me illustrate.

In money terms—a driver in Boston with a single car and a son under 25 have various options open to him:

Full coverage of \$25,000 and \$50,000 bodily injury and \$5,000 property damage at a cost of \$565 a year. Incidentally, last year, before no-fault, that cost was \$600, and this year, without no-fault, that cost would have been \$725 or more.

A \$1,000 deductible for himself and his family would cost \$491, a savings of \$75.

Add to that a \$200 deductible on property damage and the premium drops to \$432, saving \$134.

Add in the full deductibles available and the cost could drop to \$418—nearly \$150 in savings a year.

Finding companies that will explain such options to a customer let alone sell them to him is no small task today in Massachusetts—and we may need tougher laws to force the industry to offer methods of making good on the promise of lower costs that no-fault holds out. If the still-accumulating evidence shows that we do, I will file such legislation. And we are already looking at ways to improve our rate-

setting process. It does not today result in fair and reasonable rates and it lacks a consumer voice in its deliberations.

I hope the experience I have summarized for you today is helpful in your consideration of the legislation and the ideas before you. We have not found all the answers in Massachusetts, but we have asked the right questions and found, we think at least some of the correct answers.

Auto insurance is as complex a subject as any your committee and this Congress will confront. We think we've blazed a trail through a kind of wilderness—and we hope our history will help you and, through you, the Nation.

Again, on behalf of the National Governors Conference, and for myself, my thanks for the opportunity to be here today.

Senator HART. Mr. Jackson, thank you for presenting to us Governor Sargent's view and the views, as he indicates, of the Governors' conference.

Senator Moss and Senator Stevens arrived since you started. The Governor suggested that questions we intended to address to him be submitted to him in writing.

Governor Sargent has not been silent with respect to some of the concerns he voiced in the testimony you have given us. I think we should add to the record the story out of the Journal of Commerce of April 26 where, among other things the Governor said as reported by the Journal of Commerce:

The auto insurance industry was bitterly criticized here today by the Commonwealth's Governor for failing to pass onto consumers the substantial savings the companies incurred from the Bay State's 3-month old no-fault auto insurance system. Governor Francis W. Sargent said that during the first 3 months of this year, the underwriters have seen their claim costs drop by over 35 percent and have not come forward with plans to lower premiums.

At another point in this same Journal of Commerce report with respect to the several insurance programs that are available now under Massachusetts law, but about which the consumer is in ignorance, the Governor's statement was:

"I am told the industry in some cases has not only failed to inform the customers of these options but has actually refused to allow their purchase," Governor Sargent said. "Worst of all, I am told that many companies have forced customers to buy more insurance than they want in order to buy any at all."

The auto insurance industry was bitterly criticized here today by the Commonwealth's governor for failing to pass onto consumers the substantial savings the companies have incurred from the Bay State's 3-month old no-fault auto insurance system.

Gov. Francis W. Sargent said that during the first three months of this year, the underwriters have seen their claim costs drop by over 35 percent but have not come forward with plans to lower premiums.

The governor also alleged that many insurers have tried to obscure the options in the no-fault program which would lower their auto insurance rates.

"The average paid claim cost in the first quarter of last year was \$205," Gov. Sargent said. "The average paid claim cost in the first quarter of this year is \$131. The total amount of paid losses in the first quarter of last year were \$359,590—this year they are \$229,479."

#### 36 PC REDUCTION

"That is a 36 percent reduction (in claim costs) this year over last," the governor said in an address before the Massachusetts Association of Independent Insurance Agents and Brokers.

The governor said if the average paid claim costs for 1971 hold at the present rate through June they will be 69 percent lower than the first six months of 1970.

"Translated into possible future premium reductions that comes out to a further premium cost cut of 25 percent for bodily injury insurance, though not property damage and collision for in those years price inflation and the high cost of auto repair drive these costs steadily up," Gov. Sargent said. "But in bodily injury, the only area affected by no-fault, we can at least hope for further cost cuts if present experience continues."

Gov. Sargent said he would release a statistical summary next week on the first three months of the first in the nation no-fault system.

"The great irony of no-fault so far is that the industry that fought it so hard is now profiting the most from it," said the governor. Further, the industry, while it profits, blocks the consumer from the benefit of the new system, he said.

Gov. Sargent told the insurance men they were keeping the public ignorant about how to take advantage of savings on auto insurance premiums.

"Last year we provided options in auto insurance to let the buyer build his own insurance program through bodily injury deductibles for those with sufficient health insurance," he said, "and \$100 and \$200 deductibles in property damage insurance."

"We encouraged companies to provide further deductibles to cut cost of collision and comprehensive insurance," he said.

"I am told the industry in some cases has not only failed to inform customers of these options but has actually refused to allow their purchase," Gov. Sargent said. "Worst of all, I am told that many companies have forced customers to buy more insurance than they want in order to buy any at all."

Gov. Sargent said he would order a "step up in investigation of the abuses so far charged—and the industry had better be ready to reply."

Senator HART. Our next witness, and we welcome him, is the executive director of the American Association of Motor Vehicle Administrators, Mr. Louis Spitz. Mr. Spitz is accompanied I understand by their director of public information, Mr. Robert Brown.

**STATEMENT OF LOUIS P. SPITZ, EXECUTIVE DIRECTOR, AMERICAN ASSOCIATION OF MOTOR VEHICLE ADMINISTRATORS, WASHINGTON, D.C.; ACCOMPANIED BY ROBERT S. BROWN, JR., DIRECTOR OF PUBLIC INFORMATION**

Mr. SPITZ. Thank you, Mr. Chairman.

I am very pleased to be afforded this opportunity to present to this distinguished committee the comments of the American Association of Motor Vehicle Administrators on S. 976—the Motor Vehicle Information and Cost Saving Act—jointly sponsored by Senator Hart, yourself, and your distinguished colleagues from Indiana, Maine, Wisconsin and Connecticut.

The apparent intent of S. 976 is well-aimed. A legislative measure which is designed to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage, indeed aspires to a popular cause—popular with the motorist and consumer. Such competition is one of the basic underlying factors of a free-enterprise system.

By way of introduction, I am Louis P. Spitz, executive director of the AAMVA—a post which I have occupied for the past 4 years. Prior to that I was a director of the Nevada Department of Motor Vehicles for 8 years; and with the Reno, Nev. Police Department for 18 years. Three decades of my life have been dedicated to protecting the safety and well-being of motorists on our Nation's highways; and protecting the interests of the motoring public.

Therefore, I am delighted to review and offer my comments on any measure seeking to save lives—whether it be by elimination of acci-

dents or by assuring that if accidents occur that passengers and property will be less likely to be injured, killed or damaged.

It is my understanding that, if enacted, this very broad legislation would amend the National Traffic and Motor Vehicle Safety Act of 1966 to do the following:

Require that all cars manufactured after July 1, 1974, have a bumper that can withstand a five-mile-per-hour collision into a solid barrier with no damage.

Require manufacturers to rate their cars by their relative susceptibility to damage in low speed collisions.

Provide for establishment of a nationwide system of diagnostic inspection systems, for inspection of cars before consumers buy them and after crash repairs are made.

Require a uniform titling standard which includes a history of ownership—a family history—of each car.

Furthermore, S. 976 would apparently broaden the National Highway Traffic Safety Administration's mandate—contained in the National Traffic and Motor Vehicle Safety Act of 1966—to include promulgation of property loss reduction standards in addition to motor vehicle safety standards.

The American Association of Motor Vehicle Administrators is the association of State and Provincial officials responsible for the administration and enforcement of motor vehicle and traffic laws in the United States and Canada. Our association, quite naturally, has an intense interest in safe motor vehicle travel on our highways.

The feature in S. 976 that would require front and rear bumpers on 1975 model autos that would withstand a 5-mile-per-hour, car-to-fixed-barrier collision with no body damage, obviously is addressed to the loss reduction concept.

This comparatively new concept seeks not merely the limited goal of highway crash prevention per se, but, in a departure from traditional highway safety rhetoric, the wider goal of highway loss prevention by whatever means seems to work best.

This highway loss reduction concept has been gaining increasing popularity among safety professionals since the release of results of tests by the Insurance Institute for Highway Safety which showed that when four popular sedans were crashed into a solid barrier at 5 miles per hour, they averaged about \$200 each in damage. I believe that these test results originally were announced by Dr. William Haddon, Jr., president of the Insurance Institute for Highway Safety, in testimony before Senator Hart's Judiciary Subcommittee on Antitrust and Monopoly Legislation, during the hearings on auto repair costs. I assume that this provision in S. 976 is as a result of those auto repair hearings; and probably that specific testimony.

Loss reduction has received increasing attention from AAMVA's member States. There currently are two States which have enacted bumper legislation—the State of Florida during 1970 and the State of Maryland during the recently completed 1971 legislative session. More than 30 States—33 if memory serves me correctly—have considered measures related to bumper stability at low-speed impact during the 1971 legislative year.

The Federal Department of Transportation also has already acted to a limited extent in this area. On November 24, 1970, the National

Highway Safety Bureau—now known as the National Highway Traffic Safety Administration—issued a notice of proposed rulemaking on exterior protection of passenger cars.

Subsequently, DOT has issued an exterior protection standard which will provide for protection against damage to a limited range of safety-related equipment in 5-mile-per-hour crashes of front ends of vehicles, beginning with 1973 model year production; but only in 2.5-mile-per-hour crashes of the rear ends.

There are some differences in specifications between the Federal and State enacted provisions. Also, there apparently is a disagreement between State legislative leaders and the Department of Transportation over the preemption provision of this new DOT standard.

It is my understanding that the DOT is of the opinion that, once its standard takes effect, the State laws will become null. However, I also understand that this is based on an in-house opinion.

As is the case with most of the other highway safety and motor vehicle standards, it appears to AAMVA and its member States that ultimate enforcement of this standard will be left up to the State. Therefore, it would seem to us that if we are to have a Federal law, or Federal standard, that it should be confined to broad general guidelines. If the Secretary of Transportation is to promulgate the specifics of such a standard, we feel strongly that it should be in close consultation with the States; and, taking into consideration already effective State regulations in this matter.

It is difficult for States to retain a high level of enthusiasm and commitment for highway safety programs when, after expending a great deal of time and in some instances a great deal of money, they discover that shortly after their action that it is preempted by a Federal act. It is particularly discouraging when they discover that implementation of the Federal provision will require a substantial cost; and that the Federal law, in some instances, is not as strong as the State-enacted measure.

The provision in S. 976 that would require cars to be related for their relative susceptibility to damage in low-speed collisions is not primarily a safety-oriented consideration; but appears it would be of substantial interest to the consumer.

Since the damage susceptibility rating would apparently be based on a cost consideration, this matter would be of the greatest interest to those charged with the administration of consumer affairs, although there would be at least some loss reduction interest in this type of information. It could, quite logically, have a substantial influence on a consumer's decision in selecting an automobile, if such information were available.

I have offered comments previously, before Senator Hart's Judiciary Subcommittee on Antitrust and Monopoly Legislation, regarding diagnostic inspection of motor vehicles. My comments are contained in part 4 of the hearings on the automotive repair industry, held March 17-19, 1970, beginning on page 1774.

AAMVA still, Mr. Chairman, has reservations—such as expressed in the 1970 hearings before Senator Hart's subcommittee—about the probable high cost factor connected to installation of a State diagnostic system in any jurisdiction except Delaware, the District of Columbia, and New Jersey—the three with State-owned inspection sta-

tions. It very possibly could have the effect of pricing out of operation the 23 States which currently have programs with State-appointed inspection stations.

Another inspection-related provision in title 5 of S. 976 causes AAMVA some concern. It is the provision which states:

"No motor vehicle inspector may be certified by any state if he owns or receives any benefit in or from a business, or enterprise engaged in the repair or sale of motor vehicles, automotive repair parts, or accessories \* \* \*."

From a philosophical standpoint, such a proposal is sound. However, from a practical standpoint, we feel that such a standard in inspection would seriously jeopardize the programs in all 23 States where there is a State-appointed inspection system. We realize that there is a provision for areas of low population density; but we still feel that this provision would cause an adverse effect on a substantial number of inspection programs.

One other thing which I would like to note in passing is an apparent change in the thinking of the distinguished Senator from Michigan on the matters which we are addressing today. In a Detroit speech to the Society of Plastics Engineers on January 19, 1970, when this particular legislative program was outlined, Senator Hart stated that he felt that most of his plan could be accomplished without new Federal legislation.

Well, in view of the five bills connected with this package—including the broad proposals in S. 976; the national no-fault insurance proposal in the Uniform Motor Vehicle Insurance Act, S. 945; and the safety and consumer-related features of S. 946, S. 947, and S. 948; we at the AAMVA are certainly relieved that this was not a matter that would have required a substantial amount of Federal legislation.

However, there are several features in title 5 of S. 976 which appear to AAMVA to have considerable merit.

One in particular is the provision in section 502, paragraph B, which will enable the Secretary of Transportation to provide the States with financial incentive programs for establishing—if this bill is enacted—the inspection and tilting standards' provisions prescribed.

AAMVA feels that this discretionary 10 to 50 percent financial incentive, to assist States in underwriting the annual costs of such programs, is a far superior approach to the somewhat distasteful 10-percent-penalty provision for State noncompliance with the original 16 highway safety program standards.

(The following press release explains progress today by the States in implementing highway safety standards:)

Secretary of Transportation John A. Volpe has sent letters to the Nation's Governors telling them how their States rank and compare with all other States in their compliance with 16 Highway Safety Program Standards.

Under the Highway Safety Act of 1966, the States are responsible for carrying out highway safety programs to implement Federal Standards developed by the National Highway Traffic Safety Administration, and issued by the Secretary of Transportation.

In issuing a report card to the States, Secretary Volpe said:

"Ideally, all States should be fully implementing the highway safety standards . . . In my continuing review of the status of highway safety around the country, I find some advances and unhappily, some retrogression.

"As a former governor, I am of course fully appreciative of the problems in enacting your legislative programs and implementing and financing them. But the attack on highway deaths and accidents must be pressed without pause.

With nearly all legislative bodies now in session, it is most timely that as a first step, you seek passage of the traffic safety laws your State needs and put them into effect as soon as possible."

The letters also included a list for each State of specific legislative and administrative steps which it has not taken. The rating grade takes into consideration the State's announced plan as well as its current program level.

The National Highway Safety Advisory Committee, appointed by the President, recommended that Secretary Volpe send the letters to the Governors.

The Secretary sent the Governors a chart showing a fundamental grading system ranging from A to D. This grading system was developed so that each State, the District of Columbia, and Puerto Rico could readily compare its progress or lack of progress with the record of other States in relation to each of the Federal Standards.

The letter code indicates:

- (A)—The State is currently fully implementing the requirements of the Standards.
- (B)—The State's program, when implemented, will conform substantially to the requirements of the Standards.
- (C)—The program when implemented will demonstrate acceptable progress toward implementation of the elements of the Standards.
- (D)—The program does not demonstrate acceptable progress toward implementation of elements of the Standards.

The 16 Highway Safety Program Standards issued by the Secretary of Transportation include: Periodic Motor Vehicle Inspection; Motor Vehicle Registration; Motorcycle Safety; Driver Education; Driver Licensing; Codes and Laws; Traffic Courts; Alcohol in Relation to Highway Safety; Identification and Surveillance of Accident Locations; Traffic Records; Emergency Medical Services; Highway Design, Construction, and Maintenance; Traffic Lighting and Control Devices; Pedestrian Safety; Police Traffic Services, and Debris Hazard Control and Cleanup.

The States ranked in the top 10 in compliance are New York, Virginia, California, Louisiana, South Carolina, Delaware, Pennsylvania, Rhode Island, Utah, and Washington. Out of a total of 832 possible grades, there were 29 A's, 775 B's and C's, and 28 D's. Almost 94 percent of the grades were in the B and C category.

Acting Traffic Safety Administrator Douglas Toms said effective State highway safety programs will help achieve the goal of reducing highway crashes and resulting casualties.

"We are faced with 150 highway deaths a day in this country—a dismal toll. But we are making progress. Highway fatalities in 1970 totaled 55,300, but significantly, there were 1,100 fewer deaths than in 1969," Toms said.

"We are charged by law to look at the total State program and its effectiveness. Therefore, in reviewing the programs and working with the States from a technical point of view, we are together improving the quality and effectiveness of the program."

Failure to implement an approved program could result in the loss of Federal funds available for grants to the States and local communities under the Highway Safety Act of 1966. It could also lead to loss of 10 percent of the State's Federal-aid highway construction funds.

U.C. BERKELEY LIBRARY

Our association has long been opposed to this "10 percent penalty" feature, feeling that to penalize a State of its safety and highway construction moneys for noncompliance with another safety feature was a "rob Peter to pay Paul" concept at best.

The 35th Annual International Conference of AAMVA, held at the Statler Hilton Hotel in Washington, D.C., in December of 1967, adopted a resolution opposing this obnoxious feature of the 1966 Federal safety legislation. This conference was the AAMVA's first conference following the implementation of the 1966 Federal safety provisions. However, opposition to the 10-percent penalty provision has been reiterated by the AAMVA executive committee and by regional conferences annually since its initial passage and implementation.

We note that another provision under title 5 of S. 976 would require the Secretary of Transportation—not later than January 1, 1973—to amend highway safety program standard No. 2 to include requirement for a State motor vehicle registration and uniform certificate of title program similar to the registration program contemplated by the Uniform Vehicle Code, chapter 3.

The AAMVA has long been a supporter of uniform State-level systems of registration and certificate of title. Statements supporting these concepts are contained in chapter J of the AAMVA policies and position statements.

Our association also is a strong supporter of the concepts and model provisions contained in the Uniform Vehicle Code. In addition to being executive director of the AAMVA, I also currently am a member of the 5-man administrative committee of the National Committee on Uniform Traffic Laws and Ordinances, the policymaking body for the committee which publishes the Uniform Vehicle Code.

Mr. Chairman, AAMVA currently is working on a program in its vehicle services division which we feel will provide the procedures necessary to fully implement the titling provision envisioned in S. 976. I would like to, in closing, explain it briefly.

If S. 976 is enacted, Mr. Chairman, there still will be required specific procedures to implement the standards provisions—if a uniform system is to be the result. This is how AAMVA can help in making an effective system—and making it workable. AAMVA is not seeking merely a uniform registration and certificate of ownership procedures; but a system which will provide a family history on all vehicles—from the day they roll off the assembly line until the day that they are junked.

Action on this program has been underway for about a year; and we hope that the full program will be a reality before the end of 1971.

AAMVA's national registration and title workshop was held in mid-April in Dallas, Tex. At this national workshop, a resolution was enacted calling for the American National Standards Institute to develop a model uniform vehicle registration and certificate of ownership procedure.

This matter will be submitted to our AAMVA regional and national conferences in the next few months for what we feel will be routine adoption. Concurrently, we have gone to work on development of the system.

The American Trucking Associations, Inc., has agreed to joining AAMVA as a cosponsor of the American national standards com-

mittee. ATA also will be the secretariat. The procedures which we envision developing will be capable of implementing the systems outlined and prescribed in chapter 3 of the Uniform Vehicle Code.

Development of this model registration and certificate of ownership system will be closely related to development of a universal vehicle identification number. The uniform terminology necessary for development of the vehicle identification number has already been developed by a special subcommittee of the Society of Automotive Engineers (SAE), sponsored by AAMVA. Foremat for this terminology was recently issued as SAE standard J218. Once fully developed, the vehicle identification number—or VIN as it is popularly referred to—will be included on all automobiles, trucks, trailers, and recreational vehicles.

From the VIN and the uniform procedures for registration and certificate of ownership, we envision development of a uniform information system. It will tie together the various motor vehicle departments in the Nation. It will be a data net, utilizing a common data base so that the systems of the various jurisdictions can successfully be interfaced, for expeditious flow and exchange of information.

In addition, AAMVA contemplates development of a vehicle information record—or VIR. This VIR will contain information on the vehicle from the date of manufacture to the date of junking. It will be a "family history"—probably similar to that contemplated in S. 976.

Actually, Mr. Chairman, it appears that this could be—in essence—a master plan for implementation of the titling provision contemplated in this proposed legislation. And, I might add, there already has been great interest expressed by the National Highway Traffic Safety Administration for the development and implementation of this program.

A year ago, AAMVA hosted a workshop on the classification of vehicles for driver licensing purposes. The system developed by the State-level licensing administrators was adopted by the association's national conference and subsequently has been incorporated into the Federal highway safety program standard on driver licensing.

This, Mr. Chairman, we feel is the type of Federal-State relationship which you—the Members of the Congress—envisioned when you enacted the landmark highway and motor vehicle safety acts of 1966. Mr. Chairman, we contemplate this project in development of a model registration and certificate of ownership system as a similar project.

You probably are wondering when all this could come about; since I am aware that you, Senator Hart, have been critical of the pace of State safety action. Those working on the project have assured me that it can become a reality by the end of the this year.

Mr. Chairman, I thank you for this opportunity to comment on these proposals.

Good day.

Senator HART. Thanks, Mr. Spitz.

Admittedly we were considering several bills. It is hard in these hearings to question a witness on every issue raised about the several bills. Let me address a few questions to you at this point.

Let me focus first on this business of inspection. You questioned that feature of one of the bills we are considering which would separate the inspection activity from any repair or sale agency. Yet, I know that you and those associated with you in highway safety feel strongly

that there can be savings in both property and personal injury by a sound, effective inspection system.

We are in agreement on that. You caution also that there is a cost element if you go too far in trying to establish an independent, unrelated to repair business, kind of inspection center.

A couple of weeks ago, some of us went over not very many blocks away from here to the District of Columbia Diagnostic Clinic Inspection Center, and the identification of defects in a vehicle that they can achieve over there is very significant.

Now, I understand that the cost to them for the kind of diagnostic inspection that they make there runs \$2.87 a vehicle, and the technological advances in diagnostic systems continue appreciably. So I would anticipate the cost would go down rather than go up in the future.

If you measure that against what people have suggested is a \$7 billion annual savings in operating cost that can result in the elimination of the type of defects that they say diagnostic systems pick up, wouldn't you agree that if we could achieve that kind of consumer cost reduction at the cost of about \$3 a vehicle we should do it?

Mr. SPITZ. Yes, I would, if you could do it at \$3. It would depend upon the area of the country in which you are.

Senator HART. They do it for less than \$3. Isn't that exactly what we should be seeking?

Mr. SPITZ. Yes, I agree with you that we would seek this, if we can accomplish it at a reasonable cost. Money is the name of the game, let's face it.

Senator HART. Well, the District of Columbia generally is not heralded as the most imaginative or efficient governmental unit, but they have done it. So, let's crank up elsewhere. I think this legislation will help.

Now, another point you make, and it is a concern—you discussed it with us in the Antitrust Committee—is the business of preemption of standards. If the department fixes a standard, what does it do to the State that has tried to develop its own standard.

I am talking now about the standards that relate to property cost reduction. You counsel against a total Federal preemption. How would you react to a procedure under which a State could apply for a waiver comparable to the way we handle the vehicle emission standards in the case of California, showing why circumstances in that particular jurisdiction warrant still higher standards?

Senator COOK. May I interject?

Senator HART. Senator Cook?

Senator COOK. May I interject here, Mr. Spitz? If you could, would you, to the best of your ability answer at the same time how would you react to making these the basic standards, and anything greater on the part of any State would prevail rather than a waiver? In other words, these would represent the minimum standards and anything greater than these minimum standards would not be preempted, as you put it.

Mr. BROWN. Both Senator Hart and Senator Cook, yes, I believe the States would react very enthusiastically to such a provision. The point specifically that we were speaking to was the Maryland bill which I understand is a 5 miles per hour, front and rear, on the bumper, as

opposed to 5 and 2½ which the Federal standard envisions. The State of Maryland naturally is discourage. If they go to all the time and effort to formulate a standard on bumpers and then find out that they are preempted by something which is lesser by the Federal Department of Transportation, and I think a waiver such as you mentioned, Senator Hart, would be very acceptable.

Senator STEVENS. May I interrupt?

Senator HART. Senator Stevens?

Senator STEVENS. What are your thoughts on the producers? We seem to focus most of our attention on the consumer, but what of the producer who is trying to build a car that operates in 50 States then one State changes their standards contrary to the national standards?

For example, should we permit Maryland to bar the cars of Alaskans who come here because the State regulators feel that they need 5 and 5, when at the same time the national standards are set at 5 and 2½?

Mr. BROWN. Senator Stevens, you pose a very interesting observation there. But we at the American Association of Motor Vehicle Administrators have what we feel is an excellent rapport with the automobile manufacturers as well as with the Federal Government, people in highway safety, and we are confident that our administrators won't sell the auto industry down the drain as they won't sell the consumer down the drain who is entitled to a certain amount of highway safety, and that is as much as possible to save lives on the highway.

Senator STEVENS. I agree.

In my State, there is no antispin differential. You can be killed awfully quick on an icy road. We are likely to pass a bill to require that every car which comes into our State have antispin differentials. Yet, if you reside in Arizona and must pay for an antispin differential, it would be foolish. Somehow national standards must be differentiated from local guidelines.

From my understanding or your recommendations, I feel we are approaching the point of allowing the States to add to the burden, whereby the cost of vehicles imposed upon Alaskans, for example, to meet Maryland standards is going to be preposterous, and vice versa.

Mr. BROWN. I don't believe there is going to be a sufficient amount of vehicles registered in the State of Alaska coming into Maryland in the first place.

Senator HART. We skid in Michigan, too. I appreciate the exchange and I think it has helped us all. But admitting my prejudice, it seems to me to suggest that the middle ground is the prudent one, waiver, not preemption and not minimum.

Mr. BROWN. I think the waiver provision would probably be the most acceptable one to the AAMVA, Senator Hart.

Senator HART. I should compliment your association on the efforts that you are making that I was aware of and which I am glad you put on the record in pursuit of a uniform titling and car history pattern. It will serve the best interest of everybody.

Senator Cook?

Senator COOK. Mr. Spitz, I am interested in your remarks, because the State of Kentucky has an auto inspection program, as you know. It requires that the automobile be inspected on a yearly basis. It is charging, if my memory serves me, \$2. The law provides that no repairs could be made on a vehicle at the place it is inspected.

Now, doesn't that go a long way to close this loophole of a provision that no motor vehicle inspector may be certified by any State if he owns or receives any benefit in or from a business or enterprise engaged in the repair of motor vehicles, repair parts of accessories

I think just as much chicanery could ensue from a State inspector telling somebody where to have his car fixed, as from an inspector in private business telling someone where to go to have it fixed.

I am concerned about that because the automobile driver in Kentucky pays a rather substantial tax, a personal property tax, on his automobile. His license plates just increased considerably in price at the last legislature. He now pays an inspection fee. Obviously, the State legislature and the State government are going to attempt to pass the cost of a totally State-owned inspection system on to the automobile owner.

I am sure that this will come in the form of an increase in personal property tax to cover this cost, because unlike the District of Columbia, where it can be concentrated in a highly urban area, there are about four major areas in the State of Kentucky, and out of 120 counties there are about seven counties that should be classified as being urban, and there are about 113 counties that are extremely rural.

Even though there may be a provision by which this could be waived, I have a notion in some States in the Union there would be more waivers than there would be State-controlled inspection systems.

I would like to address myself to the fact that somehow or other I have a little problem saying that every inspector who inspects cannot repair the automobile, that somehow or other, he is a dishonest inspector because he has something to do with the repair business, and that as a result of our built-in attitude that he is dishonest, we are going to see to it that the State has to finance the entire inspection system.

I might say, I am on your side in this argument, and I want you to know it. I am just wondering why all of a sudden legislatively we should say that because there have been extensive hearings on the high cost of the repair of automobiles, that that should indicate that everybody who is in the business is dishonest.

There are some newspapers that I don't like, but I can't sit here and say every one of them in the United States is dishonest. I am just wondering if you would address yourself to this, because I think in essence what we are saying is we are building in a provision whereby we say there is nobody honest enough in the automobile business to inspect your automobile, even though he can't make the repairs under our law.

Mr. SPITZ. You are so right in your remarks, Senator Cook. Because over the years where some States have had an inspection program, then some citizen, concerned citizen, made an issue out of it because he was supposedly "taken"—well, given a bum deal instead of a \$10 repair he ended up paying \$100.

After a couple of years without inspection, they decided to go back to the inspection program and allow that man at that service station or that vendor to make the inspection and then also make the repair.

The people at the State level, though, are thinking as you are, Senator Cook. The small businessman is not all crook. Because of the small business we have a great Nation today and they are giving it

back to him. You might have one bad apple in the barrel as you may have one bad policeman, which doesn't make all policemen bad.

I must agree with you and my association agrees with you, that most of these vendors make a good inspection, they make a good repair and in most instances they are not overcharging.

Senator COOK. Would you have any objection provided that the inspection station making the inspection could not make the repairs?

Mr. SPITZ. Would I have an objection?

Senator COOK. If we could not see our way, for instance, in marking up a bill, if we could not see our bill compelling every State to set up a State inspection system, providing that an inspector at a particular location who made the inspection and who made a notification that repairs had to be made, would not be eligible to make those repairs, that they would have to be made at another location?

Mr. SPITZ. We would have no objection to that if the bill were to read that way.

Senator HART. I think the question is would you object if it was prohibited at the point of inspection.

Mr. BROWN. Would you repeat that, please?

Senator HART. I think I am trying to repeat Senator Cook's question.

Senator COOK. I will phrase it as easily as I can. Would you object if there was a prohibition against an inspector making the repairs if you did not have a totally, State-administered inspection system?

Mr. SPITZ. No.

Mr. BROWN. I don't believe that we would, sir.

Mr. SPITZ. Absolutely not. No, sir. We would not object.

Senator HART. That raises the same implication which I think it would be unfair for me to accuse Senator Cook of entertaining. It suggests that you can't trust a man to do both.

Senator COOK. Mr. Chairman, I hate to be caught in a double negative.

Senator HART. That is what the implication was with respect to my proposal.

Senator COOK. I hate to be caught in a double negative, but certainly the language of the bill says in effect that this cannot be done by anybody who is in the business, it cannot be done by anybody engaged in the repair or sale of motor vehicles, repair parts or accessories, which in effect says we don't trust you to do it.

Senator HART. Why don't you trust him to do this repair?

Senator COOK. I do, but also know the reality of trying to get a bill out of here and get it out of the majority side of the committee in this regard, and I am being honest enough to say that there will be some States that may find it rather difficult. Mine has tremendous rural sections and I am afraid we would be asking for more waivers than we would be asking for the establishment of the State system.

I will go a little farther. We would find it very difficult, I think, to finance a State inspection station in many parts of the State without requiring people from at least five, six, or seven adjoining counties to use the same location.

In some rural counties in Kentucky, as a matter of fact, when you live in the county, you have to go through two other counties to get back to the county seat in the county where you live.

This is just a reality. This is a reality of rural America. If you want to say that he has to go to a State inspection place which is

located in Hazard, Ky., and you live in Perry County, and you have got to go down through three other counties to get there, you are not talking about \$2. You are talking about a good half day off or better, and you are talking in some instances of traveling 40 and 50 miles to get there. This is increasing that cost a lot more than \$2.

Senator HART. Does anybody want to suggest, because the purpose of this hearing is to find out how to protect the consumer in this area, the appropriateness of mobile inspection stations for thinly populated areas?

Senator Cook. I have no objection to this as long as there is enough time lag between the time the mobile station gets there and the expiration date on the fellow's car—that he is not going to get tagged on the highway by a State policeman because the mobile facility hadn't gotten there.

Mr. BROWN. Senator Hart, you asked about the possibility of mobile inspection vans and things such as this.

To give you something parallel, most everybody that operates a motor vehicle has a driver's license, and we have been successful in developing some of our States that have rural areas such as Senator Cook has, such as Senator Stevens, Senator Moss, mobile driver licensing facilities, and I think this concept could very easily be adapted to the vehicle inspection.

But getting back to the original point, this is one of the reasons we raised a cost provision in the diagnostic inspection, because of remote areas like this and because in 23 of the States that have inspection programs at the present, they are State appointed inspectors, and we have got to rely on those people, and we have got to rely upon those people to make our inspection program workable, otherwise it is going to become so costly we might find some severe financing problem and the financing might in turn be passed along to the motorists, and if it is, this in turn would probably push the cost of the inspection up.

As you mentioned, it is \$2.87 in the District of Columbia, but with the possible exception of the State of Rhode Island, the District of Columbia is a unique place and one of three States that currently have State-owned inspection facilities.

Senator HART. I wouldn't burden the record, but it is my hope—belief actually—that this is an area where “better-late-than-never” a concentrated effort is being made to use the incredible technology that runs around loose to make much more effective inspections thereby reducing cost. Such technological advance begins, I guess, in Detroit, by designing cars in a fashion that makes the diagnostic inspection system easily applied and the readings easily made.

What we are trying to do is insure the automobile owner that he will be free of the chicanery that all of us understand is possible and be safe on the roads.

I don't know what other Senate offices have experienced, maybe mine is not typical because of the State from which I come and some of the hearings in which I have engaged, but consumer complaints about automobile repairs, top my complaint mail.

Mrs. Knauer of the White House staff I believe says the same thing about her mail, and you ought to check at the Federal Trade Commission. Without charging anybody with doing other than trying to

make an honest living effectively repairing cars, a lot of people aren't getting the product, and it is having negative effects upon our auto safety too.

So, these hearings are intended to develop a forum that will improve on that track record, and it is such a wretched record that even we should be able to help improve it.

Senator COOK. Mr. Chairman, may I just add to that, that I have no objection to the Commonwealth of Kentucky establishing a State-operated inspection system, but I would hope the chairman would also understand that not by the farthest stretch of the imagination, even if we have a complete and absolute State inspection system, that after the State inspector gets through and tells the individual what work is required on his automobile, that that individual still isn't subject to the consumer problems that are presented now, and have been presented to the chairman and to Mrs. Knauer and to the FTC, that when he goes to the individual repairman to have it repaired, he can still be gouged.

This paragraph in the bill is not going to stop that by any stretch of the imagination.

Senator HART. Nor is it advertised to, but it sure would help. That is one man's opinion.

Senator COOK. I would like to sit down with the Senator some day—

Senator HART. Next week, join us, we will have more explanations about the advantages and the safeguards that are built in by the kind of diagnostic inspection to which very few Americans have ever been exposed but which increasingly all of us should be.

Senator COOK. This is a good time for me to publicly say that I will be delighted to be here next week. It was my understanding that the Commerce Committee decided that all of these hearings would be held as a committee of the whole, and we find ourselves with so many other Commerce Committee subcommittee hearings simultaneously that have been scheduled by the staff, that it is very difficult to be able to be here all the time and try to play some part in these other responsibilities.

Senator HART. I share the problem, and it is not unique to you or me or this committee. It is one of the reasons the kids wonder if the system would work.

Senator Stevens.

Senator STEVENS. Do I understand that your VIN and VIR system can be established without the necessity of Federal legislation?

Mr. BROWN. Yes, sir, Senator. We anticipate that it will be established on the basis of a uniform vehicle identification number. Yes, we are anticipating it within the year.

Senator STEVENS. Will that cover merely new vehicles constructed after this year, or will it dateback and include the history of existing vehicles? What is going to be the scope of it? From your statement, I can't quite grasp its scope.

Mr. BROWN. I believe, if I understand it correctly, that it will be initiated with new vehicles. However, I will consult with the people on our staff who are responsible for this program and submit an answer for the record.

(The following information was subsequently received for the record:)

The vehicle identification number (VIN) and vehicle identification record (VIR) programs will be applied only to new vehicles.

Senator STEVENS. You say :

It will be a data net, utilizing a common data basis so that the systems of the various jurisdictions can successively be interfaced for expeditious flow and exchange of information.

By this, do I understand you are going to establish a system whereby all new vehicles would have the same data. In order to transfer those vehicles, additional new data of the new purchaser would be added to the base. Therefore, there will always be a continuous registration, you might say, showing a family history of the two vehicles after this year?

Mr. BROWN. Well, everything will be based on this uniform vehicle identification number, and this will be the basis of the system, sir.

Senator STEVENS. I think the chairman has indicated his desire to establish this family-ownership concept so that a purchaser is aware of its previous owner. For example, if some salesman says that a sweet little old lady whose husband has been in jail owned the car that nobody has abused it—the purchaser could check up on that. Is this going to be possible under your system?

Mr. BROWN. Yes, sir. That is the vehicle identification record, Senator Stevens. The vehicle identification number will be the basis for identifying each vehicle in this model registration and certificate of ownership system as we envision it, and this will go to make up this vehicle identification record which will have track of the automobile based on its vehicle identification number from the day it rolls off the assembly line in Detroit or wherever it rolls off to the date it is ultimately junked.

Yes, we will know if a little old lady or who specifically has owned the vehicle, if it has been in an accident, and any information such as this. And if all of our systems can be successfully interfaced we can find out in a hurry. If you are in your home State of Alaska and the vehicle comes from Senator Hart's or Senator Cook's home State of Michigan or Kentucky, we can communicate with this data as we envision it.

Senator STEVENS. Do you foresee that motor vehicle registrars will keep this information and share it on request or will it be listed? In other words, if one of Senator Hart's constituents sells a car to one of my constituents and it is then registered for the first time in Alaska, will the Alaska registration indicate previous ownership or will this data be available upon request?

Mr. BROWN. I believe it will be available if you ask for it. I don't believe it would show. However, once again I am not that specifically familiar with the system.

Senator STEVENS. Thank you. Thank you very much, Mr. Chairman.

Senator HART. Senator Cook.

Senator COOK. You really will have to have two identification numbers, won't you? You will have to have car identification and you will also have the license identification? For instance, in the Commonwealth if you sell your automobile, your license plate stays with the automobile. In several States your license plates are yours for the year. You are going to have to make a distinction between an automobile number and a license number for the purpose of police identification, et cetera, aren't you?

Mr. SPITZ. Yes.

Mr. BROWN. Yes, sir. The license number would be a part of the record, but the one common thing throughout the whole system will be this vehicle identification number which identifies that particular vehicle.

Senator STEVENS. In real estate, for instance, you always have a back reference. Is this part of your vehicle identification, or is this merely in the master records and not in the records that go with the title itself?

Mr. SPITZ. This would be in the master records, Senator.

Senator COOK. I might add we have another statute in the Commonwealth which provides that any problem that occurs to an automobile that was previously a cab and the buyer has not been specifically notified that this was a cab, that all of those repairs will frankly suffer to the benefit of the guy who sold an automobile and didn't give written notice. I think this is something that should be given consideration.

Here you have a group of vehicles that get out on the road after a year or a year and a half with 80,000 to 90,000 miles, and when you get through with them you think they have come from the little old lady with tennis shoes. I wonder if you have given any consideration to specific identification of the separate types of vehicles that I would say have been ridden hard and hung out wet? Do you have any of this in your vehicle identification program?

Mr. SPITZ. I believe this is part of the program that the committee is now working on. They are considering all these things that you are mentioning here, Senator.

Senator COOK. Thank you, Mr. Chairman.

Senator HART. Senator Moss.

Senator MOSS. I have enjoyed listening to the exchange and I haven't any specific questions. I just wanted to volunteer one observation. Whenever we have to set up a regulation of any sort, it doesn't mean we are accusing everybody of being a crook. Otherwise, we wouldn't have any larceny lawyers or anything else. So a regulation to catch those who do transgress the proprieties, of course, you can say affects the others, but that is one thing we have to suffer in order to give protection to the consumer.

So this idea that Senator Cook's State has is not a bad idea, that the fellow who makes the inspection doesn't also get to do the repair on the car, because there is where we have had a lot of abuse. Maybe the State system isn't the way to go, but we need some kind of protection there, and what we are looking out for is the consumer, the fellow on the end who doesn't know about his car. We are completely helpless, 90 percent of us, 95 percent of us maybe, with a car. If the thing isn't running well, we go in, and we don't know. We are just in the hands of the fellow who makes the inspection and says you need so-and-so. Pretty soon he has put a lot of things on there that we find out later in some other way that we didn't need at all.

Mr. SPITZ. You may be assured, Senator Moss, we appreciate your thoughts and we shall continue to work with Senator Hart's staff in this respect.

Senator MOSS. Thank you.

Senator HART. Gentlemen, thank you.

Next we are going to hear from spokesmen for large insurance buyers who are members of the American Society of Insurance Man-

agement, and we welcome the counsel for the American Society, Mr. James E. Bailey, and Mr. William Mortimer, of Norton Simon, of New York, and Robert Frederickson, of United Airlines.

Particularly, I welcome Mr. Bailey, with whom I labored on another committee for a long time now. It is a pleasure.

**STATEMENT OF JAMES E. BAILEY, COUNSEL, AMERICAN SOCIETY OF INSURANCE MANAGEMENT, INC.; ACCOMPANIED BY WILLIAM MORTIMER, DIRECTOR OF INSURANCE, NORTON SIMON, INC.; AND ROBERT M. FREDERICKSON, MANAGER OF CLAIMS, UNITED AIRLINES**

Mr. BAILEY. Mr. Chairman, it is a privilege and a pleasure to be here. I have been a staff member of both committees for a number of years.

This morning I have with me two distinguished insurance buyers who are representatives of our group. One is a former national president, Mr. William Mortimer, who is on my left, who is now with Norton Simon of New York. He will have a short statement to present on his own, not as a representative of our organization, however.

The other gentleman, Mr. Frederickson, represents United Airlines in Chicago. Both these gentlemen are responsible for the expenditure of premium dollars running into the many millions in the case of United and Norton Simon.

I have a very short statement. It consists of three things. For the committee members, a roster of our membership is attached. I would call attention to the chairman of the fact that he will find our Detroit chapter members listed alphabetically in this brochure. We do not have members in Kentucky, Alaska, or in Utah in sufficient number to have a chapter designation. Some are at-large members and others are members that have plant facilities within the State but have their membership in another location.

The second part of the statement is a reprint from our magazine called Risk Management of an attitude survey which was taken on no-fault and published at our conference in February.

I think that the survey will be of interest to the committee. However, it should be pointed out that of the 1,910 questionnaires that we sent out, only 299 were returned, and, as a result, we consider that was not definitive of our total membership but that the responses would speak for themselves as the attitudes of the members who returned the questionnaire.

Now, Mr. Chairman, I will turn to my prepared statement.

Mr. Chairman, members of the committee, my name is James E. Bailey. I am a member of the District of Columbia Bar with offices at 1030 15th Street NW., Washington, D.C. I make this statement as the retained counsel, representing the American Society of Insurance Management, Inc., 500 Fifth Avenue, New York, N.Y.

The American Society of Insurance Management—known as ASIM—is the largest nationally organized group of insurance consumers in the United States. ASIM's current membership consists of more than 1,860 corporate consumers, with more than 2,800 risk management personnel, who are divided among 43 chapters in the United States and Canada.

In total aggregate premium dollars, for all types of insurance, including workmen's compensation, our members spend in excess of \$8.5 billion annually to cover the insurance needs of American industry.

My appearance today was authorized by the executive committee of ASIM and its vice president-legislation, Edward P. Lalley, insurance manager, Kraftco Corp., New York City.

Our membership has been very much concerned over the entire question of no-fault. Our members have carefully noted the developments over recent years. Our two Massachusetts chapters did not oppose the no-fault legislation which was enacted last year in their State.

The subject has been of such importance that 1,910 questionnaires were prepared and sent out to our corporate members to obtain the attitude of our managers toward this important automobile insurance problem. A total of 299 questionnaires were returned expressing their personal opinions—that was a 15 percent response.

Of those answering, the responses favored supporting the principle of no-fault insurance in general, but did not favor this as a complete substitute for tort law liability. Rather, those answering thought ASIM should support legislation substituting no-fault for certain types of loss up to certain monetary limits with tort law concepts beyond that.

I have commented earlier on the insufficient number of questionnaire results to constitute a firm position either for or against no-fault, and I do not represent that we are in favor of or necessarily opposed to no-fault.

Our members were in close agreement in opposing the concept of absolute liability for commercial vehicles, such as the Stewart proposal in New York, and they were also opposed to having a percentage of responsibility assigned to commercial vehicles for economic loss on either the vehicles, the number of axles or any other such basis that may be desired.

Our membership is strongly opposed to discriminatory treatment affecting operators of commercial vehicles. Testimony to that effect has been offered in several States prior to my appearance here today.

It is our considered opinion that when the Senate Committee on Commerce considers this legislation, it should delete any provision imposing absolute liability on commercial vehicles on any basis.

None of the information used to substantiate the Stewart proposals and that of the Department of Transportation is persuasive to us. It is at best speculation and is not grounded on fact. In our opinion the legislation should not attempt to make such a classification because we feel it would be subject to attack on the ground that it is unconstitutional because it fails the test of the equal protection of the laws provisions contained in the Constitution.

The reasons which have been suggested for such discriminatory action present an illogical situation. It leaves a large segment of the area which the change seeks to reform. We do not believe that it is adequate to reform part of the situation and leave part of it unreformed.

I should like to comment briefly on the situation respecting the integration of benefits from two or more insurance coverages. With the adoption of a no-fault system, auto insurance would become mandatory coverage on a first-party basis. There should be an intelligent integra-

tion of benefits of this coverage and all other coverages which would also respond to provide reimbursement for the economic loss so suffered. It is being given careful and serious consideration by the House Committee on Interstate and Foreign Commerce.

Recently Representative Moss submitted a bill which excluded the provisions for absolute liability, and we are presently submitting that to our membership and it may be that in the future we will be able to take a more definitive position on this question of no-fault legislation.

Considerable discussion is also heard on the question of a Federal presence in this particular problem area. Secretary of Transportation John Volpe and other witnesses have indicated they have no objection to Federal standards being imposed upon the States which must be complied with.

ASIM would prefer the continued regulation of insurance under State jurisdiction, but we do not find it inconsistent to suggest minimum Federal standards to assist in a solution of the chaotic conditions which would affect interstate operators and vehicle owners in attempting to comply with different versions of no-fault legislation in adjacent or other States in which they must operate. It is ASIM's position that such Federal standards would be helpful as guidelines for the States and that regulation under such guidelines would continue to be a State function.

Under present no-fault proposals very little consideration is given to including claims for property damage. Again, we would like to suggest to the committee that there appears to be no logical reason for covering bodily injury claims under the no-fault concept and excluding claims for property damage.

We know of no logical reason for this difference of treatment. We respectfully suggest that if the principle of no-fault is appropriate and proper for bodily injury claims, it should also be proper for claims for property damage.

With reference to the legislation pending before the committee affecting the mass marketing of personal lines insurance, including automobile, it has long been a policy position of our legislative committee that it favors having access to all markets and being able to buy whatever type of insurance is desired freely and without restrictions.

We have consistently opposed restrictions imposed by some States in the sale of so-called mass merchandising plans.

ASIM risk managers are always concerned with the prevention of losses. It has generally considered that constructive efforts in this area could include its application to so-called design standards or safety standards for vehicles. It should be noted, however, that we have not affirmatively adopted that policy.

In summary, the American Society of Insurance Management is strongly opposed to any type of discriminatory treatment imposing additional liability upon commercial vehicles, adopts needed minimum Federal standards to obtain some degree of uniformity throughout the States which would aid the operations of our interstate companies, believes in a system of intelligent integration of benefits under no-fault auto insurance and all coverages which would also respond to provide reimbursement for the economic loss so suffered, and urges the com-

mittee to give equal treatment under no-fault for bodily injury claims and claims for property damage.

Mr. Chairman, I thank the committee for the privilege of appearing here today.

Senator HART. Before hearing from Mr. Mortimer, I read your testimony as urging that the States continue to play the role of the regulator of insurance but you see no inconsistency with that objective if the Congress was to establish with respect to no-fault legislation Federal standards; do I interpret correctly your position?

Mr. BAILEY. Yes, Mr. Chairman, you do. We testified here previously on the Federal Guarantee Bill, as you recall, before Senator Moss, and our position was consistent with what was stated today as far as State regulation is concerned. We think that Federal standards will aid our operators, we think it will provide a degree of uniformity where it left to the States to pass many different conflicting no-fault plans we may be at a serious disadvantage for those companies which operate in a multiplicity of States.

Senator HART. I am delighted that Mr. Mortimer intends to give us a statement of his own. I would like to say for the record that Mr. Mortimer has indicated in his role as a national leader in the field an intense desire to separate the myths from the realities with respect to this volatile subject matter and has given very constructive leadership. I am delighted that you are here.

Mr. MORTIMER. Thank you very much, Senator.

Mr. Chairman, members of the committee, my name is William S. Mortimer. I am making this statement as a concerned citizen who has been involved in the automobile insurance industry for almost 25 years, 18 years of which have been working on the side of the consumer. I have worked as a consultant and as an insurance or risk manager for two large U.S. corporations. I have also been active in the American Society of Insurance Management for a number of years and was national president in 1969 and 1970.

Twelve years ago I reached the conclusion that the tort system was not solving what I considered to be the major problems arising out of serious automobile accidents, which is the prompt and adequate payment to the accident victim. I consider the tort system a slow, expensive, wasteful, and unfair system. The automobile insurance consumer can no longer afford a system which requires \$2.50 to pay a dollar in benefits, particularly when these benefits themselves are increasing in cost so rapidly; nor can he afford to wait months for this capricious system to pay him inadequately or if at all when he has a serious problem.

Society itself can no longer afford the misdirection of automobile insurance payments so that the most seriously injured are so inadequately indemnified for their loss that a majority of them become partly or wholly dependent upon society to care for them and their families after they have been involved in an accident.

The insurance industry, whether they realize it or not, can no longer afford to provide insurance to cover the tort system because they are pricing their product out of the reach of a rapidly growing number of their customers. These, their customers, are rebelling against increases.

Further, the insurance industry has many problems, but without a doubt the automobile insurance problem is the greatest one. It is of

such magnitude that they must solve it or they will not be able to solve their other problems. And it cannot be solved by continuation of the tort system. Even the large corporations can no longer afford the tort system.

We need a strong, viable insurance industry to provide insurance and service to us. We do not have one primarily because the insurance industry is now directing most of its managerial talents to try and solve the automobile insurance dilemma while it continues to waste its assets providing insurance to cover the tort system. Who can afford such a system? Only those few who are profiting greatly from its inherent waste and inefficiencies and who are now speaking loudest for its continuation.

What is the solution? Even those who favor its continuation agree that it is not working well. They suggest a streamlining, but they still end up with a system where most of those who suffer serious injuries will be inadequately protected. The only way to protect the seriously injured is the purchase by each individual of a complete insurance program to cover their own economic loss. Their solution is for the consumer to spend even more for insurance than he is presently paying. The people will not favor any change which only requires increases in their insurance cost. This cannot be the answer to the problem.

There has to be a change, and Senator Hart's bill will provide the needed change. I also wish to say that I strongly favor a Federal bill because I think that it will be impossible to have a workable no-fault program if each State sets up its own bill. It will work a tremendous handicap on not only the large corporations but the individual as well if they have to comply with 50 different laws.

I believe that the opponents will be able to find a rearguard action in each and every State so that meaningful change would be many years away. I favor State administration of the necessary insurance that each car owner would need to comply with the Federal bill because it can be effectively administered at the State level.

My position on discrimination against the operator of the large vehicle has been well stated by Mr. Bailey. I also favor the inclusion of property damage under the proposed bill as much of the same waste is present in trying to get the courts to determine fault in a property damage case as it is in a bodily injury case.

In conclusion, I wish to make these six points.

(1) Society, individually and collectively, cannot afford to continue the tort system.

(2) The only ones who understand the problem and still favor it are those with a special interest to protect. Their position should be largely discounted.

(3) There is no way to continue the tort system in automobile insurance and solve the problem of properly paying the injured victim without a doubling up in cost.

(4) The Hart bill is by far the most comprehensive and workable that has been suggested and should be vigorously supported by all people.

(5) A Federal bill with State administration of the necessary insurance would be the most effective way to make this badly needed change work properly.

(6) The law should not discriminate against any individual or group.

I thank the committee for the opportunity of making my thoughts today on this very important subject.

Senator HART. Mr. Mortimer, for the record and for the benefit of all of us who will study that record and at the risk of forcing you to be immodest, will you state your background more fully than you did at the outset?

Mr. MORTIMER. I started in the insurance industry as an agent for a large company. I was involved in insurance agencies for about 4 years in that period of time. I was fortunate to be able to go back in the Navy during the Korean war but more fortunately ended up as an insurance specialist for the Office of Insurance and Navy Materiel in Washington.

After that I spent time as an insurance consultant to the Chief of Army Ordinance. Then, I joined a consulting firm which had approximately 600 clients throughout the country acting as more or less the insurance expert in their insurance problems.

I spent a year and a half with a large insurance brokerage firm. After that I spent 3 years with Douglas Aircraft, and have been with my present employer since 1961.

Senator HART. And briefly describe your present employer, Norton Simon.

Mr. MORTIMER. First, I would like to make clear I am not speaking for my present employer. I am speaking only for myself and a substantial number of my counterparts who would like to have something that approximates what I said put in the record.

My responsibility with my present company is the avoidance whenever possible of loss by effective safety provisions, safety programs, property conservation techniques, the development whenever possible of means of avoiding to buy insurance where we can obtain the service elsewhere. This does not mean I am against the function of insurance, because it is a very vital one to my company and to myself in carrying out my job.

And lastly, I am responsible for the purchase of such insurance as we need to protect our assets, our earning power or to provide service for us in conducting our business.

Senator HART. Before asking questions, I suggest we inquire whether Mr. Frederickson has a statement to make.

Mr. FREDERICKSON. Mr. Chairman, I have no statement. I am here with Mr. Bailey and as a member of the American Society of Insurance Management.

I do wish to state we are in entire agreement with his argument and we support this no-fault principle.

Senator HART. Are we to assume that United Air Lines has automobiles as well as airplanes?

Mr. FREDERICKSON. They have. Not as many, but they do.

Senator HART. Senator Cook?

Senator COOK. Mr. Bailey, I noticed from the attached ASIM survey that your organization, at least under my interpretation, favors the no-fault concept with monetary limits, and that a majority of your members that answered the survey showed a preference for those monetary limits somewhere in the vicinity of \$5,000.

Mr. BAILEY. That is right.

Senator COOK. They felt the no-fault concept monetary unit should apply to hospital costs, vehicle loss and damage, other property damage, which you discussed this morning, loss of wages and other miscellaneous expenses, but as to applying the concepts to pain and suffering, and death and dismemberment, that they were kind of even.

Mr. BAILEY. That is true.

Senator COOK. Mr. Mortimer talked to this point. I am sorry, I can't get all my names in line and I apologize.

I am interested, and I think I rather agree, that your association takes a strong stand against absolute liability for commercial carriers and not only do you take this probably from a very selfish standpoint but also from a constitutional standpoint.

Mr. BAILEY. That is right.

Senator COOK. I might say to you that I think there is merit to your constitutional standpoint.

Mr. BAILEY. Thank you, Senator Cook.

Senator COOK. So, not only do I think they disagree on the merit of their own position but I think they have a good point in disagreeing on the standpoint of being discriminated against in regard to their constitutional rights.

Mr. Chairman, I have no other questions. I didn't even ask a question. I think I kind of summed up part of it from the ASIM and find this very interesting.

I am wondering if it would be possible, Mr. Chairman, for this association with its tremendous impact on the industry, if there is some way that we could conceivably consider, with the publicity that obviously these hearings will engender, polling your organization again.

Mr. BAILEY. We would be very glad to appear at any time and render any assistance that we can or get additional information if the committee so desires.

Senator COOK. I notice that you present something that is not presented in the bill in any way, and that is your organization was not in conclusive agreement about the limit on loss of wages, that they had a preference of a thousand dollars, but they also suggested that it should be a percentage of wages such as two-thirds or 70 percent.

Now, this could get well above a thousand dollars if the results of the poll were not that there should be a cutoff of loss of wages up to a thousand dollars a month but that it be a percentage such as I indicated just now.

I know it would be a lot of work to your organization, but it might be helpful to make some type of determination as to how they might feel after these hearings, and a summation of what these hearings have deduced which I am sure your organization will present to your membership.

Mr. BAILEY. We will do that. I feel certain if the committee wants some more results to the question, we will be able to cooperate with you.

Senator HART. You were nice enough not to ask us to fund the mailing cost.

Mr. BAILEY. The mailing cost isn't that great, actually.

Senator HART. Senator Stevens?

Senator STEVENS. I have no questions, Mr. Chairman.

Senator HART. Gentlemen, thank you very much.

Now, we welcome the president of the National Association of Mutual Insurance Agents, Mr. Robert V. McGowan.

Mr. McGowan is accompanied by the chairman of the association's Federal Legislative Steering Committee, Mr. Lee E. Walton, and its director of government affairs, Mr. George Potts.

**STATEMENT OF ROBERT V. MCGOWAN, PRESIDENT OF NATIONAL ASSOCIATION OF MUTUAL INSURANCE AGENTS, INVESTMENT BUILDING, WASHINGTON, D.C.; ACCOMPANIED BY LEE E. WALTON, CHAIRMAN, FEDERAL LEGISLATIVE STEERING COMMITTEE; AND GEORGE G. POTTS, DIRECTOR OF GOVERNMENT AFFAIRS**

Mr. MCGOWAN. Thank you, Senator.

Mr. Chairman and gentlemen of the committee, my name is Robert V. McGowan of North Attleboro, Mass. I am the owner of the R. V. McGowan Insurance Agency, Inc., in North Attleboro, which I founded and have operated since 1954. I am also the current president of the National Association of Mutual Insurance Agents, an organization of more than 18,000 independent property and casualty insurance agents with members in nearly all 50 States, and with headquarters in Washington, D.C.

Accompanying me here today are Lee E. Walton, the immediate past president of our association, of Jackson, Mich., and chairman of our Federal Legislative Steering Committee, and George G. Potts of Washington, D.C., our director of government affairs.

Mr. Chairman, I would like to summarize my statement, and I would also request that our complete statement, which has been given to you be entered in the record.

Senator HART. Mr. McGowan, without objection it will be printed in the record in full.

Mr. MCGOWAN. It has been reported that nearly 70 percent of the property and casualty insurance written in the United States is handled by independent insurance agents. That figure suggests at least two important and related ideas: That we have almost constant contact with a large majority of the insurance-buying public; and also that we have firsthand feedback of their views on what is good and what is bad about our business.

I cannot overemphasize the influence that this knowledge has had in defining the position of our association on the matter of automobile insurance reform legislation which is before this committee, and which I am privileged to bring to your attention at this time.

On previous occasions at House and Senate hearings there have been implications, as well as testimony, challenging the need for implications, as well as testimony, challenging the need for the services of the agent in the marketing of automobile insurance. This proposition is completely unknowing and irresponsible.

The independent agent is deeply concerned with seeking meaningful solutions to automobile insurance problems. In the final analysis, the insurance business is a business of trust, principally because of the intangible nature of the insurance contract, and the independent agent who sells and services that contract indeed becomes the contract himself.

On that basis, I hope I am not being too presumptuous when I say there is probably no one in this room today who recognizes the need for change in our present system of compensating auto accident victims more than the independent insurance agent. However, it is just as true that there are widely differing views in this room as to the degree and the means of bringing about that change.

For example, S. 945 calls for the complete abolition of our present tort liability system in favor of a "pure" no-fault system. Moreover, this proposal in effect would turn over regulation of the automobile insurance business to the Federal Government. The National Association of Mutual Insurance Agents unalterably opposes these concepts.

It seems to us that to do away with the tort liability system and replace it with a completely different and untested concept which all the States must adopt almost immediately is to invite chaos. A more prudent approach we think would be to begin on a limited basis and permit the system to change in an evolutionary manner.

I would like to propose to you a program which our association earnestly believes can go a long way toward solving the present automobile insurance problems. Entitled "motorists insurance—protection plan," we recommend it be given careful consideration by this committee.

This plan is a comprehensive package of legislative proposals to be enacted at the State level. It is designed to provide speedy, automatic basic injury compensation for all auto accident victims, and to afford the greatest possible protection for the Nation's motorists by implementing stringent driver and highway safety measures and improving the present legal system.

I would like now, Mr. Chairman, to concentrate on section III since it is perhaps the real heart of our proposed program. It provides for some significant changes in our present system for compensating auto accident victims, but with a minimal disruption of the important tort liability concept.

Under the plan, every automobile liability insurance policy covering any nonfleet private passenger motor vehicle would include the following minimum benefits, payable immediately regardless of fault:

- (1) Medical and hospital expense coverage up to \$2,000, subject to an optional \$250 deductible;
- (2) Disability coverage of 85 percent of gross income lost, commencing 30 days after the accident and continuing for 52 weeks and subject to a \$500 per month maximum or a total of \$6,000;
- (3) Uninsured motorist coverage of at least \$10,000 per person and \$20,000 per accident; and
- (4) Accidental death benefits of at least \$5,000 when the death is a direct result of the accident.

However, the policyholder would have the right to reject the automatic coverages listed above for himself and members of his family. Where a guest passenger is concerned, these coverages would not apply if they were provided under his own auto insurance policy.

As independent agents who come into daily personal contact with insureds who are victims of automobile accidents, we are well aware of the value of a system, which would provide for immediate and automatic payment of basic personal injury benefits, regardless of fault.

Again, however, we do not propose that the purchase of such cover-

age by the policyholder be mandatory. Many of the proposals which are now, or will be, before this committee seek to force all motorists to purchase these first-party coverages as a condition to being permitted to operate a motor vehicle.

By offering our limited no-fault plan on an either-or basis, we feel we are preserving the individual's freedom of choice. He is free to buy either an auto insurance policy with no-fault provisions, or he can reject the no-fault coverages and purchase the automobile insurance policy he has always had.

The entire area of damages for pain, suffering, and inconvenience has been a major subject of debate for years, Mr. Chairman. Critics of such awards claim that there is a tendency to overdramatize and exaggerate automobile accident injuries in order to collect the largest sums possible.

While we agree that automobile insurance costs could be lowered if the recoverable damages for pain, suffering, and inconvenience were in some way reduced, we cannot go along with those who would abolish such recoveries altogether. On the contrary, we believe that pain, suffering, and inconvenience are a very real and important part of the determination of damages in personal injury cases and should continue to be compensable for all such victims.

A person who suffers such injuries as the result of the carelessness or intentional conduct of another, sustains a loss as real as the hospital and medical expenses he incurred. Money cannot replace a lost limb or eye but there is simply no other measure yet devised.

Accordingly, we feel that some objective criteria should be established in determining this issue and it should be subject to reasonable limitations, especially in the less serious cases. Thus, our proposal suggests the following standards for pain, suffering, and inconvenience be adopted for all motor vehicle accident cases:

Up to 50 percent additional damages when medical and hospital expenses amount to \$500 or less;

Up to 100 percent additional damages when medical and hospital expenses exceed \$500.

In cases of death, permanent disfigurement, loss of limb, permanent loss of a bodily function and other exceptional circumstances, these standards may be raised by the court.

Until a better means of determining such damages is conceived, we believe these standards will prove fair and equitable to all concerned, and will at the same time provide reasonable safeguards against those who would attempt to profit from such injuries.

Mr. Chairman, the broad package of proposals we have made here is offered as a balanced blending of the various points of view on how best to improve our existing automobile insurance reparations system. It encompasses what we believe to be the best features of many of the proposals being made.

A virtue of our program is that it will allow for a major step forward without burning our bridges behind us. Moreover, it allows for future testing so that we may observe and evaluate public acceptance without losing the desirable features of the present system and without being committed to an irrevocable course. We offer it as a sound, evolutionary approach to improving the auto insurance reparations system.

U.C. BERKELEY LIBRARY

And now, Mr. Chairman, I would like to offer to this committee what our association feels is the most plausible method for implementing our program.

In the first place, it should be emphasized that we firmly believe that such a program can and should be implemented at the State level. We agree with Secretary of Transportation Volpe that the "sense of the Congress" be "subject to the admonition \* \* \* that the Congress cannot, and will not, long ignore the need for evolving new and updated approaches to insurance and accident compensation," and that operation and regulation of the automobile insurance business should continue to be by the private insurance industry at the State level.

However, we disagree with the Secretary and others who apparently feel that a national pure no-fault automobile insurance system is both desirable and inevitable. To the contrary, we see no concrete evidence that such a system is in the best interest of all concerned, particularly the insurance-buying public. We believe that the public does not really want a virtual elimination of the present tort system in favor of pure no-fault. What it does want is change for improvement—and that is what we offer here today.

Accordingly, we suggest the following four-step approach:

(1) The Congress should adopt a concurrent resolution expressing its intent that the States enact, no later than July 1, 1974, legislation establishing a private industry-administered and State-regulated automobile insurance reparations system built upon certain of the principles enunciated by the Department of Transportation study and embodying all of the features of our program.

(2) Interested organizations—such as the Council of State Governments, the National Association of Insurance Commissioners, and the various insurance organizations, including our own—should be encouraged to work together to draft model legislation based on the "sense of the Congress" as a guide to the States in developing their statutes.

(3) The Department of Transportation should be directed to monitor State actions and to issue periodic reports analyzing the progress being made by the States.

(4) On or after July 1, 1974, the Department of Transportation should submit to the Congress a complete report on action by the States in adopting such an automobile insurance reparations system by statute, so that the Congress may be in the best possible position to take whatever action it deems necessary and appropriate at that time.

In adopting a concurrent resolution, we suggest that the Congress give careful consideration to the general approach contained in Senate Concurrent Resolution 23, but with appropriate modifications that would reflect the approach we have outlined to you here today.

As president of the National Association of Mutual Insurance Agents, I pledge the complete support of my association in any and all endeavors to enact such a program in every State by 1974.

I urge, Mr. Chairman, that this pledge not be taken lightly. Our association made a similar promise some 17 months ago to this same committee in connection with a proposal to establish the Federal Insurance Guarantee Corporation. In the intervening months, efforts by our association and others have resulted in passage of insolvency

laws in some 33 States to date, and we are continuing our efforts in the remaining State legislatures.

This proposed approach, Mr. Chairman, would in our opinion achieve the basic goal of establishing an improved automobile insurance reparations system throughout the country; but at the same time it would preserve the traditional roles of the States and the private insurance industry. Equally important, moreover, it would allow the Congress of the United States to fulfill its responsibility to the American motoring public.

Much has been said about the advantages of a Federal program over programs developed and regulated at the State level. Emphasis has been put on the efficiency and economy of uniformity, on the need for prompt action, and on the record of the States in comparable undertakings such as Workmen's Compensation. Certainly there is something to be said for these arguments, but in my judgment the record of the States, for the most part, is favorable when all factors are considered.

The Congress in its wisdom in 1945 passed Public Law 15, better known as the McCarran-Ferguson Act, which left the matter of insurance regulation to the States, subject to some restrictions. Since that time, the field of regulation has been a changing, evolving phenomenon for the States. But while these changes have been taking place, the industry has continued to function soundly and properly. And the regulation of our industry by the States has maintained a level of effectiveness at least equal to that of any comparable industry.

On the other hand, during this same period, the Federal Government has had the opportunity to perform in the fields of medicare and welfare—both somewhat related to insurance. I would suggest with all respect that the Federal performance has not proven superior in these fields.

We believe that the State approach to regulation of an industry such as ours is preferable because it is flexible and responsive to geographic and individual needs; an opportunity for research, for innovation and trial and error.

The important thing is that if one of the 50 States undertakes an experiment and fails, it has not brought the whole country down with it. If, for example, the Massachusetts no-fault experiment is successful, we have a good foundation on which to build for the other States. If it is not, we have the opportunity to adjust to the mistakes that may have been inherent in that program.

Of equal importance is that the insurance industry, under State regulation, has been free to adjust at the local level to needed innovations brought on by a constantly changing economy and population.

Existing automobile insurance policies are universal in concept. In my own State of Massachusetts, for example, today one buys an automobile insurance policy that takes care not only of the statutory requirements there, but all the requirements of the other States as well. Thus, although the States often have requirements peculiar to each, the policyholder who purchases his insurance in Massachusetts has a policy which will meet the requirements of, say, Texas, should he be involved in an accident in that State.

If State regulation of insurance is operating satisfactorily, as we contend, you might very well ask then why you are receiving com-

plaints about policy cancellations, high premiums, or improper attention to claims. We do not suggest they be taken lightly. They are terribly important. As professional agents we have as great a concern as you for the welfare of these people. Most of them, after all, are our clients. But I submit that the criticism of our industry, considering its tremendous exposure to an enormous number of consumers, may very well be moderate. May I suggest that criticism aimed at drug companies, automobile manufacturers, the railroads, the Post Office—these too have been subject to heavy criticism, especially in recent years.

There is a further aspect of this question of State versus Federal regulation. Takeover by the Federal Government of regulation of the automobile insurance business can only be followed ultimately by the redirection of State insurance premium tax revenue to Washington. How long will the very philosophy that suggests Federal involvement in the automobile insurance business be satisfied not to tap premium taxes and fees now collected by the States?

To establish almost overnight a Federal system of regulation and control which has been developed in each State over many years would not only prove costly—it would undoubtedly lack the understanding of local conditions so vital in an industry such as ours.

And now, Mr. Chairman, I would like to address myself to S. 946, a bill which would permit the marketing of "group" automobile insurance by removing existing State laws, regulations, and other similar restrictions which may prohibit such practices.

I want to say emphatically that the National Association of Mutual Insurance Agents is not opposed to the group marketing of automobile insurance per se. We cannot, and we do not, oppose any marketing system of insurance, so long as it is legal, ethical, and above all, in the best interests of the insurance-buying public.

But, what we do oppose is any so-called group marketing scheme which would mislead the public into believing that such plans would automatically guarantee them automobile coverage at lower costs; and that eventually all employers would offer automobile insurance as a standard fringe benefit of their employment. In our opinion, based on those group automobile insurance plans operating thus far and with which we are familiar, such benefits do not exist.

Mr. Chairman, it is not our intention to be totally negative about the possible adoption of group automobile insurance plans which S. 946 would undoubtedly bring about. Many of the problems that arise can be solved, and indeed some probably already have been. But I do believe that they should be considered seriously by anyone who is advocating, promoting, or considering using group marketing of automobile insurance.

While the problems I have referred to are mainly concerned with the employer-employee relationship, I would point out a general flaw which exists in most, if not all, present group marketing plans. Most programs do not provide for allocation of expenses incurred by the program to the group itself. As a result, these expenses are charged to all of the insuring company's accounts.

Thus, the individual policyholder of that company who does not belong to the group—either because of personal choice or because he does not qualify—actually subsidizes the group policyholders. This practice, in our opinion, is grossly unfair and highly discriminatory.

For example, most group plans now in existence provide stop-loss limits. If a loss exceeds these limits, it is not charged to the group and thus the cost falls on the company's other policyholders who are not eligible for the group.

Prof. Bernard L. Webb, CPCU, who is a strong advocate of mass merchandising, who has written perhaps the most authoritative book on the subject, entitled "Mass Merchandising of Automobile Insurance," and who, I believe, served as a consultant to the Senate Anti-trust Subcommittee in their earlier deliberations on this subject, refers to these stop-loss provisions in the group plans of the Michigan Credit Union League, the Farm Bureau Companies and others. He concludes on page 48 of his book, and I quote, "Group merchandising is not practical unless a substantial portion of premium is paid by the employer."

Professor Webb then goes on to say, on page 59, and again I quote:

"The inequitable allocation of expenses between collective programs and individual policy holders is a distinct possibility. Some insurers may be tempted to use this method of maintaining a low price structure in order to obtain large blocks of premiums. There would be little chance of detection of such improper expense allocation at the present time.

For several years now, the National Association of Mutual Insurance Agents has sponsored and supported legislation at the State level which would in effect permit group marketing of automobile insurance. We have tried to emphasize that stringent safeguards were needed to prevent the insuring public from being duped into accepting a program which would ultimately prove detrimental to their insurance needs. Admittedly, we have enjoyed only a very limited success so far and even have been accused of opposing mass merchandising. But the point is, in those States which have enacted such laws, the insuring public is relatively well-protected because our safeguards were provided for in the proved legislation.

Louisiana, about a year ago, enacted legislation that embodied our suggested safeguards virtually intact; and a similar law was placed on the books a little earlier in New Hampshire. And in New York State, after the legislature had approved the bill—only to have Governor Rockefeller veto it at the last moment, Insurance Superintendent Richard Steward subsequently issued regulations setting forth rather stringent standards for group merchandising of insurance, and they included most of the safeguards we had advocated in the vetoed legislation.

I might add, Mr. Chairman, in Massachusetts the AFL-CIO which a year ago violently opposed our proposed legislation in mass merchandising is in our legislature this year with a bill of their own providing regulation almost word for word, comma for comma to our bill.

Today, in these States, we are confident that group plan participants are relatively well-protected.

Accordingly, Mr. Chairman, we have offered basic guidelines which our association believes must be followed in any group marketing plan for automobile insurance if the insuring public is to be protected adequately.

Mr. Chairman, at this point in the interest of saving your time, I would ask permission to exclude enumerating those guidelines which are incorporated in our original statement.

However, I would be happy to answer any questions you may have on them.

Senator HART. Thank you.

Mr. McGOWAN. It should be pointed out, of course, that several of the principles in our guidelines are in conflict with parts of section 3 of S. 946. We sincerely believe, however, that unless some reasonable and, in our opinion, necessary safeguards are applied to these new marketing plans, the resulting abuses could create even more problems for the insuring public than the concept is intended to eliminate.

Finally, Mr. Chairman, I would like to comment briefly on S. 976, which among other things calls for the design and production of motor vehicles more damage resistant.

Earlier, I referred to specific proposals we have made to promote highway safety, principally aimed at the motor vehicle driver. In our proposed program, we purposely omitted references to the equally important problem of the motor vehicle itself. Our action was predicated on the belief that the Department of Transportation would issue meaningful regulations attacking the serious shortcomings in the automobile which in turn lead to the soaring costs of automobile insurance.

Since then, however, the Department of Transportation has issued bumper safety standards for motor vehicles. While they are a beginning, we are disappointed with the DOT standards because they simply do not go far enough. In our opinion, they will not help us make significant progress toward reducing automobile repair bills and lowering automobile insurance costs.

Accordingly, Mr. Chapman, we support legislation such as this which will in effect provide DOT a mandate to issue stringent standards providing for improved motor vehicle design and production. In addition, of course, it will give the motoring public access to readily available information regarding the comparative safety and susceptibility to damage of the various motor vehicles.

Several insurance companies have already announced significant premium reductions for motor vehicles equipped with bumpers capable of withstanding low-speed crashes. We are confident that all of our companies will ultimately make similar moves if such features become a normal part of all motor vehicles. Then, and only then, Mr. Chairman, can we expect a meaningful reduction in personal injuries and deaths resulting from auto crashes, and a comparable reduction in automobile insurance costs.

I pledge the full support and cooperation of our association toward enactment of such legislation by the Congress. In the meantime, until more meaningful regulations are forthcoming from the Department of Transportation, we will continue to press for stronger motor vehicle design and production standards at the State level.

In conclusion, Mr. Chairman, I repeat that almost everyone agrees that improvement in automobile insurance is needed. Agents, insurance companies, State regulators, State and Federal legislators—none are completely satisfied with automobile insurance as we know it today. But above all, the American motoring public is not completely satisfied. And after all, that is whom automobile insurance is designed to serve.

Until concerted action is taken by all of us, the public will not be

properly served. Now is the time to get off dead center and start moving forward. We respectfully urge you, therefore, to give every possible consideration to the approaches we have proposed to you today.

Thank you, Mr. Chairman, for allowing us to share with you our thoughts and suggestions on the very important legislation now before you.

Senator HART. Mr. McGowan, thank you.

Did Mr. Walton have anything?

Mr. WALTON. I do not have a prepared statement. I am just here to answer any questions that may be directed my way.

Senator HART. Sir, did you care to add anything?

Mr. POTTS. Mr. Chairman, I do not. I am also at your disposal to attempt to answer any questions you may have.

Senator HART. I will open on a happy note first.

Thank you for the support you give to S. 976. With you I think it is long overdue.

Mr. MCGOWAN. We thoroughly agree with your position, Mr. Chairman.

Senator HART. I have raised this with other people. It is this notion that unless you hang on to the tort system you lose this sense of personal responsibility that will deter careless or reckless driving. You refer to that as a reason against going to complete no-fault. While there is no need in engaging in a debate here because in S. 945 we really do not eliminate entirely the tort concept, how do you respond to the Department of Transportation's conclusions that this notion of personal responsibility is not operative under the present system? In that DOT report on page 53 they said:

The claim of a significant deterrent effect for the present automobile liability insurance system has so far proven unsusceptible of substantiation by empirical evidence. . . . most accidents are caused by environmental or personal factors which are external to the individual's conscious control and that punishment or its threat, therefore, is ineffective as a deterrent to deviant driving behavior.

That is a pretty fancy way of trying to say what I have been saying all along. What do you say?

Mr. MCGOWAN. In the first place, don't believe the major reason for holding on to some part of the tort liability concept is that it might add to personal responsibility. I don't quite agree with DOT's position because I think the individual who is held responsible for his liability is held up to public exposure, because in most cases suit is entered against him, in some cases he has to go through the agonies of the civil trial, the expense, the time and the public exposure. So I think there is at least a mild deterrent effect in holding a citizen responsible under civil liability for his actions.

I agree with you, though, that the major responsibility for enforcing personal responsibility or personal attention to driving habits does rest on the law enforcement authorities. Coming from Massachusetts—perhaps you know or maybe you don't—because I read our Governor's statement this morning, and this would lead you in a different direction, but the limited no-fault bill in Massachusetts was a bill which was prepared by independent insurance agents, it was filed in the legislature by independent insurance agents, and it was supported actually by all segments of the insurance industry. It is true that the ultimate bill which the Governor signed was opposed by the industry because

it offered some pie-in-the-sky benefits to policyholders in other areas of insurance other than that covered by the bodily injury section.

But it is not correct to say that the industry opposed it. In fact, as I say, the agents designed the bill and filed it. The reason we opposed complete no-fault, Mr. Chairman, is because we were disturbed about the sharp reduction in benefits to the public. We felt once the public found out what they had, that the image of our industry, which is none too great in the first place, would deteriorate further.

I point out what I think is a flaw in your bill, Mr. Chairman, in that you have a very comprehensive coverage situation, but it seems to me there are some serious holes in it. For example, a college student who might get in an automobile accident and suffer the loss of his right arm below the elbow would not have a 70 percent disability. Yet, all he would be able to recover would be his medical expense and rehabilitation expense. He wouldn't be eligible for any portion of his wages because he never had any. We think there is a serious lack of coverage in benefits to the public in most of the pure no-fault plans.

You see, our plan in Massachusetts, for example, is designed to take care of 95 percent of all the motoring public, because despite the fact we have the highest claim frequency in the United States, our average claim settlement in 1969 for bodily injury was \$780. It might give you some idea why the trial lawyers are so much opposed to our legislation, because this seriously would affect their income.

We read about the \$200,000 verdicts and the \$2 million verdicts, but really, 95 percent of the public is concerned with a verdict under \$2,000.

Senator HART. I doubt it would turn you around in terms of supporting the Hart-Magnuson bill, but I think the college student with the lost arm would not be limited to medical and hospital expense. I think that comes within our catastrophic injury right to tort action section. But in any event, you say in response to my question that the deterrent effect of personal responsibility is not the principal reason for opposing no-fault.

Mr. McGOWAN. That is right.

Senator HART. If we could pin you to the wall and insist on an answer, what would the principal reason for retaining tort be?

Mr. McGOWAN. The principal reason, Mr. Chairman, is I feel in a serious accident, a serious disfigurement or permanent disability that the citizen should have the right to pursue the person who caused his serious problem.

Senator HART. I agree; that is why we think our bill has preserved it.

Mr. McGOWAN. Mr. Chairman, could I ask a question? Perhaps I don't properly understand the bill, but don't you define catastrophic as a disability of more than 70 percent?

Senator HART. I think there would be a lawyer's argument on the definition. Let me ask that there be printed at this point in the record the section of the bill that bears on the question. I think that is the fairest, safest, most responsible way to answer it.

(9) The term "catastrophic harm" means permanent and total disability (including death at any time resulting from injury) or permanent and partial disability of 70 per centum or more. The term "catastrophic harm" includes disfigurement that is permanent, severe, and irreparable.

Senator Cook.

Senator COOK. Thank you, Mr. Chairman. In your statement, Mr. McGowan, you are off to a great start and then all of a sudden we get

down to, "However, the policyholder would have the right to reject the automatic coverages listed above for himself."

This is the same as workmen's compensation, he can take it under the registry or he can take his remedies under straight tort liability. The thing that bothers me is the language in the Volpe report, and I shall read kind of a summary of it; it says—

45 percent of seriously injured victims receive no compensation from automobile liability insurance. Of injured people who do receive liability insurance benefits, those whose losses are less than \$500 collect on an average of four times their losses. On the other hand, people with more than \$25,000 of out of pocket medical expenses, lost wages, average less than 15 percent for coverage. When serious injury occurs, 5 percent of the stricken households have to send other members of the family to work, 3 percent have to move to cheaper housing, 20 percent have to take money from savings or the sale of property, 12 percent miss debt payments.

Now, it seems to me that your one, two, three, and four should constitute conceivably the minimum coverage, and then provide that coverage after that would allow tort recovery, if, in fact, it is the feeling of the injured individual that he should seek that remedy.

Now, it would seem to me that what we are talking about is your own kind of modified Massachusetts plan, is it not?

Mr. McGOWAN. It has some resemblance, Senator, to the Massachusetts plan.

Senator Cook. What was the original proposal that the insurance agents submitted to the legislature in Massachusetts, and where did they vary from the plan that was ultimately passed and signed by the Governor.

Mr. McGOWAN. The original plan, Senator, provided that there would be basic protection limits up to \$2,000, and you would have no right to sue under tort liability for medical expense or loss of wages up to that \$2,000. It took away your right to tort liability. It further provided that you could not sue for pain and suffering unless your medical expenses exceeded \$500, but if they did exceed \$500, then you had the right to pursue under tort liability.

Senator Cook. But you waived your right to the maximum \$2,000?

Mr. McGOWAN. No, you did not. The only difference in the ultimate bill which—of course, the bill that was signed by the Governor extended a 15 percent—see, our bill had statutorily built in a 15-percent reduction in insurance rates for bodily injury coverage. We were facing, as the Governor pointed out this morning, an increase of 20 to 30 percent under the old system, but instead of that we got a 15-percent decrease, and the companies agreed to this, and it was actually incorporated in the statute. But then, in the legislature amendments were offered which first of all forced the companies to take anybody for insurance regardless of their driving record. They could have been convicted of manslaughter, drunken driving, they still had to take them.

No. 2, it extended the 15-percent decrease to property damage and collision coverage for which there were no actuarial bases. There was an actuarial basis for the 15-percent reduction on the bodily injury because a study was made and concluded that if you put in that \$500 limit before you could sue for pain and suffering, that it would produce a savings of between 15 and 20 percent.

The industry did oppose those extensions, and the Governor did sign the bill with those extensions in them. The Supreme Court ultimately declared those parts of the bill unconstitutional.

Senator COOK. As a matter of fact, he said in his statement that there is going to be an increase in those premiums, did he not?

Mr. MCGOWAN. He said there would have been if they didn't have the no-fault.

Senator COOK. I think he also said there probably would be this year.

Mr. MCGOWAN. There was an increase. After the Supreme Court declared the extension unconstitutional, a rate increase was allowed in property damage and collision coverage. But the bill that now is law is essentially the one that we had filed in the first place, Senator. The only difference is in addition to the \$500 for medical expense—and we had also permanent disfigurement and disablement in there—but they added fractures as a right to sue for pain and suffering.

Senator COOK. Obviously, we can get ahold of the Massachusetts Act as it currently is, but I wonder if you would have the opportunity to send to the staff the proposed bill that you submitted to the Massachusetts legislature in its original form so that we might be able to make a comparison of it.

Mr. MCGOWAN. I would be very happy to do so.

(The following information was subsequently received for the record:)

THE COMMONWEALTH OF MASSACHUSETTS—IN THE YEAR ONE THOUSAND NINE HUNDRED AND SEVENTY

[S. 1580]

AN ACT Providing for compulsory personal injury protection for all registered motor vehicles, defining such protection, restricting the right to claim damages for pain and suffering in certain actions of tort, regulating further the premium charges for compulsory automobile insurance, and amending certain laws relating thereto

Be it enacted by the Senate and House of Representatives in General Court assembled, and by the authority of the same, as follows:

SECTION 1. The first paragraph of section 34A of chapter 90 of the General Laws is hereby amended by striking out, in line 2, as appearing in the Tercentenary Edition, the words "thirty-four J" and inserting in place thereof the following words—thirty-four N.

SEC. 2. Said section 34A of said chapter 90 is further amended by adding the following paragraph—

"Personal injury protection," provisions of a motor vehicle liability policy or motor vehicle liability bond which provide for payment to the named insured in any such motor vehicle liability policy, the obligor of any motor vehicle liability bond, members of the insured's or obligor's household, and authorized operator or passenger of the insured's or obligor's motor vehicle including a guest occupant, and any pedestrian struck by the insured's or obligor's motor vehicle, unless any of the aforesaid is a person entitled to payments or benefits under the provisions of chapter one hundred and fifty-two, of all reasonable expenses incurred within two years from the date of accident for necessary medical, surgical, x-ray, and dental services, including prosthetic devices and necessary ambulance, hospital, professional nursing and funeral services, and in the case of persons employed or self-employed at the time of an accident of any amounts actually lost by reason of inability to work and earn wages or salary or their equivalent, but not other income, that would otherwise have been earned in the normal course of an injured person's employment, and for payments in fact made to others, not members of the injured person's household and reasonably incurred in obtaining from those others ordinary and necessary services in lieu of those that, had he not been injured, the injured person would have performed not for income but for the benefit of himself and/or members of his household, and in the case of persons not employed or self-employed at the time of an accident of any loss by reason of diminution of earning power and for payments in fact made to others, not members of the injured person's household and reasonably incurred in obtaining from those

others ordinary and necessary services in lieu of those that, had he not been injured, the injured person would have performed not for income but for the benefit of himself and/or members of his household, as a result of bodily injury, sickness or disease, including death at any time resulting therefrom, caused by accident and not suffered intentionally while in or upon, or while entering into or alighting from, or being struck as a pedestrian by, the insured's or obligor's motor vehicle, without regard to negligence or gross negligence or fault of any kind, to the amount or limit of at least two thousand dollars on account of injury to or death of any one person, except that payments for loss of wages or salary or their equivalent or, in the case of persons not employed, loss by reason of diminution of earning power, shall be limited to amounts actually lost by reason of the accident and further limited (1) in the case of persons entitled to wages or salary or their equivalent under any program for continuation of said wages or salary or their equivalent to an amount that, together with any payments due under such a program, will provide seventy-five per cent of any such person's average weekly wage or salary or its equivalent for the year immediately preceding the continuation of said wages or salary or their equivalent to an amount that will provide seventy-five per cent of any such person's average weekly wage or salary or its equivalent for the year immediately preceding the accident. In any case where amounts paid for loss of wage, salary or their equivalent are reduced as a result of any program for continuation of the same and such reduction produces a subsequent loss, as when the limit of any such program for continuation of wage or salary or their equivalent is exhausted with the result that an injured person cannot recover for a later injury or illness as he would have been entitled to but for such a reduction, such subsequent loss to an amount equaling the reduction in personal injury protection made in accordance with this section shall, if incurred within one year after the receipt of the last benefit provided under this section, be treated as a loss of wages, salary or their equivalent incurred as a result of the injury to which personal injury protection applied.

Personal injury protection shall also provide for payment, to the named insured or obligor and members of their households, all amounts defined in this section in any case where such persons incur such expense or loss as a result of such injury while in, upon, entering into or alighting from, or by being struck as a pedestrian by, a motor vehicle not insured by a policy or bond providing personal injury protection unless such person recovers such expenses or loss in an action of tort. Insurers may exclude a person from personal injury protection benefits if such person's conduct contributed to his injury in any of the following ways while operating a motor vehicle in the commonwealth:

- (1) while under the influence of alcohol or a narcotic drug as defined in section one hundred and ninety-seven of chapter ninety-four;
- (2) while committing a felony or seeking to avoid lawful apprehension or arrest by a police officer, or
- (3) with the specific intent of causing injury or damage to himself or others.

Sec. 3. The first sentence of section 34D of said chapter 90, as most recently amended by section 3 of chapter 517 of the acts of 1964, is hereby further amended by adding at the end of the first sentence thereof the following words: and the deposition shall in writing authorize the state treasurer to pay over to the insured assigned a claim under section thirty-four N any and all amounts, including without limitation the reasonable costs of investigating and settling any such claim and such other reasonable expenses expended by it to satisfy a claim for personal injury protection made against it by any person, other than the depositor or members of his household, who is entitled to such payments as a result of the unavailability of personal injury protection benefits on said depositor's motor vehicle.

Sec. 4. Said chapter ninety is hereby further amended by inserting after section 34K the following two sections:

*Section 34M.* Every motor vehicle liability policy and every motor vehicle liability bond, as defined in section thirty-four A, issued or executed in this commonwealth shall provide personal injury protection benefits as defined therein except to the extent such defined benefits to an insured or obligor or members of an insured's or obligor's household may be modified, reduced or eliminated by the purchase of the deductible authorized in this section. The benefits due and payable under any motor vehicle liability policy or bond as a result of the provisions therein providing personal injury protection benefits, and any benefits due any person entitled to make claim under the assigned claims plan established in accordance with section thirty-four N, are granted in lieu of damages otherwise

recoverable by the injured person or persons in tort as a result of an accident occurring within this commonwealth.

Every owner, registrant, operator or occupant of a motor vehicle to which personal injury protection benefits apply who would otherwise be liable in tort, and any person or organization legally responsible for his acts or omissions, is hereby made exempt from tort liability for damages because of bodily injury, sickness, disease or death arising out of the ownership, operation, maintenance or use of such motor vehicle to the extent that the insured party is, or would be had he or someone for him not purchased a deductible authorized by this section, entitled to recover under those provisions of a motor vehicle liability policy or bond that provide personal injury protection benefits or from the insurer assigned. No such exemption from tort liability shall apply in the case of an accident occurring outside the commonwealth. However, if any person claiming or entitled to benefits under the personal injury protection provisions of a policy or bond insuring a vehicle registered in this commonwealth brings amounts otherwise due such a person under the provisions of section thirty-four A shall not become due and payable until a settlement is reached or a final judgment is rendered in such a case and the amounts then due shall be reduced to that extent that damages for expenses and loss otherwise recoverable as a personal injury protection benefit are included in any such settlement or judgment.

Claim for benefits due under the provisions of personal injury protection or from the insurer assigned shall be presented to the company providing such benefits as soon as practicable after the accident occurs from which such claim arises, and in every case, within at least two years from the date of accident, and shall include a written description of the nature and extent of injuries sustained, treatment received and contemplated and such other information as may assist in determining the amount due and payable. If benefits for loss of wage or salary, or in the case of the self-employed their equivalent, are claimed the party presenting such a claim shall authorize the insurer to obtain details of all wage or salary payments, or their equivalent, paid to him by any employer in the year immediately preceding the date of accident, or earned by him, and authorize the insurer to make any reasonable necessary investigation as to whether or not such loss may be reduced in whole or in part as a result of any program calling for the continuance of such wage, salary or earnings during absence from work. The injured person shall submit to physical examination by physicians selected by the insurer as often as may be reasonably required and shall do all things necessary to enable the insurer to obtain medical reports and other needed information to assist in determining the amounts due. Noncooperation of an injured party shall be a defense to the insurer in any suit for benefits authorized by this section and failure of an insurer to pay benefits in the event of such noncooperation shall not in any way affect the exemption from tort liability granted herein.

Personal injury protection benefits and benefits due from an insurer assigned shall be due and payable as loss accrues, upon receipt of reasonable proof of the fact and amount of expenses and loss incurred, but an insurer may agree to a lump sum discharging all future liability for such benefits on its own behalf and on behalf of the insured. In any case where benefits due and payable remain unpaid for more than thirty days, and unpaid party shall be deemed a party to a contract with the insurer responsible for payment and shall therefore have a right to commence an action in contract for payment of amounts therein determined to be due in accordance with the provisions of this chapter.

Any insurer paying benefits in accordance with the provisions of this section shall be subrogated to that exact extent to the rights of any party it pays and may bring an action in tort against any person liable for such damages in tort who is not exempt from said liability as a result of the provisions of this section. Said insurer is also hereby given the right to make claim for all expenses it incurs on account of such payments, including the net amount of benefits paid, costs of processing claims for any such benefits, and the expenses of enforcing this right, against any other insurer providing a motor vehicle liability policy or bond on a motor vehicle registered in this commonwealth, whose owner or operator would, except for the exemption from tort liability provided in this section, be liable for such damages in tort. Determination as to whether any insurer is legally entitled to recover any such expense from another insurer shall be made by agreement between the

involved insurer, or, if they fail to agree, by arbitration in accordance with the provisions of the General Laws.

Each insurer providing personal injury protection shall issue to any person purchasing a motor vehicle liability policy or bond, at his option, a policy endorsement, approved as to content by the commissioner of insurance and subject to such other regulations regarding said endorsement as the commissioner may from time to time make after appropriate hearing, which shall provide that there shall be deducted from amounts that would otherwise be or become due to the policyholder alone or to the policyholder and members of his household, as the policyholder elects, an amount of either two hundred and fifty dollars, five hundred dollars, one thousand dollars or two thousand dollars, again as the policyholder elects, said amount to be deducted from the amounts otherwise due each person subject to the deduction. Any person electing such an endorsement or subject to such an endorsement as a result of the policyholder's election shall have no right to claim or to recover any amount so deducted from any owner, registrant, operator or occupant of a motor vehicle or any person or organization legally responsible for any such owner's, registrant's, operator's or occupant's acts or omissions who is made exempt from tort liability by this section.

Amounts deducted from payment in accordance with the provisions of the preceding paragraph shall not have any effect upon the determination of whether or not the reasonable and necessary expenses incurred as a result of any injury exceed or do not exceed five hundred dollars, which determination may affect an injured person's rights unsection section six D of chapter two hundred and thirty-one.

thirty-one.

*Section 34N.* Insurers authorized to provide personal injury protection in this commonwealth are hereby directed to organize and maintain an assigned claims plan to provide that any person resident in the commonwealth, other than the owner or registrant of a motor vehicle not insured by a policy or bond providing personal injury protection or a member of such owner or registrant's household, who suffers loss or expense as a result of an injury arising out of the ownership, operation, maintenance or use of a motor vehicle while the motor vehicle is upon the ways of the commonwealth or in any place therein to which the public has a right of access, may obtain personal injury protection benefits through said plan in any case where no personal injury protection benefits are otherwise available to such a person provided that the following shall not be entitled to such benefits:

(1) a person entitled to payments or benefits under the provisions of chapter one hundred and fifty-two, or

(2) a person who is subject to exclusion from personal injury protection benefits by insurers under section thirty-four A of this chapter.

Said plan shall contain such rules and regulations for operation and for the assessment of costs as shall be approved by the commissioner of insurance. Any claim brought through said plan shall be assigned to an insurer in accordance with the approved regulations of operation and that insurer, after such assignment, shall have the same rights and obligations it would have if prior to such assignment it had issued a policy providing personal injury protection applicable to the loss or expenses incurred. Any party accepting such benefits hereunder shall have such rights and obligations as he would have were a policy providing personal injury protection benefits issued to him.

Sec. 5. Chapter 231 of the General Laws is hereby amended by inserting after section 6C the following section:-

*Section 6D.* In any action of tort brought as a result of bodily injury, sickness or disease, arising out of the ownership, operation, maintenance or use of a motor vehicle within this commonwealth by the defendant, a plaintiff may recover damages for pain and suffering, including mental suffering associated with such injury, sickness or disease, only if the reasonable and necessary expenses incurred in treating such injury, sickness or disease for necessary medical, surgical, x-ray and dental services, including prosthetic devices, and necessary ambulance, hospital, professional nursing and funeral expenses are determined to be in excess of five hundred dollars unless such injury, sickness or disease (1) causes death, or (2) consists in whole or or in part of loss of a body member, or (3) consists in whole or in part of permanent and serious disfigurement, or (4) results in such loss of sight or hearing as is described

in paragraphs (a), (b), (c), (d), (e), (f) and (g) of section thirty-six of chapter one hundred and fifty-two or (5) consists of a fracture.

Sec. 6. Notwithstanding any provisions of section one hundred and thirteen B of chapter one hundred and seventy-five of the General Laws to the contrary, for the purposes of putting into effect the provisions of the General Laws providing for personal injury protection, the commissioner of insurance shall, on or before September the fifteenth in the current year, fix and establish the same classifications of risks and premium charges at least fifteen per cent lower for each classification of risk within each territory from the following rates:

	Class 10	Class 12	Class 20	Class 22	Class 24	Class 26	Class 30	Class 40	Class 42	Class 50
<b>Territories:</b>										
1.....	\$117.00	\$140.50	\$351.00	\$374.50	\$193.00	\$164.00	\$169.50	\$222.50	\$304.00	\$234.00
2.....	108.00	129.50	324.00	345.50	178.00	151.00	156.50	205.00	281.00	216.00
3.....	100.50	120.50	301.50	321.50	166.00	140.50	145.50	191.00	261.50	201.00
4.....	96.50	116.00	289.50	309.00	159.00	135.00	140.00	183.50	251.00	193.00
5.....	88.00	105.50	264.00	281.50	145.00	123.00	127.50	167.00	229.00	176.00
6.....	79.00	95.00	237.00	253.00	130.50	110.50	114.50	150.00	205.50	158.00
7.....	68.00	81.50	204.00	217.50	112.00	95.00	98.50	129.00	177.00	136.00
8.....	63.50	76.00	190.50	203.00	105.00	89.00	92.00	120.50	165.00	127.00
9.....	59.00	71.00	177.00	189.00	97.50	82.50	85.50	112.00	153.50	118.00
10.....	54.50	65.50	163.50	174.50	90.00	76.50	79.00	103.50	141.50	109.00
11.....	49.00	59.00	147.00	157.00	81.00	68.50	71.00	93.00	127.50	98.00
12.....	43.50	52.00	130.50	139.00	72.00	61.00	63.00	82.50	113.00	87.00
13.....	37.00	44.50	111.00	118.50	61.00	52.00	53.50	70.50	96.00	74.00
14.....	30.50	36.50	91.50	97.50	50.50	42.50	44.00	58.00	79.50	61.00
15.....	24.00	29.00	72.00	77.00	39.50	33.50	35.00	45.50	62.50	48.00

Said premium charges shall be the maximum charges to be used and charged by companies in connection with the issue or execution of motor vehicle liability policies or bonds, both as defined in section thirty-four A of chapter ninety of the General Laws for the ensuing calendar year or any part thereof but any company may make written application to the commissioner of insurance for permission to use, in place of the premium charges fixed and established by him as aforesaid, such lesser charges as are now permitted by the provisions of section one hundred and thirteen B of chapter one hundred and seventy-five.

The rate of all other motor vehicle insurance coverages including those motor vehicle insurance rates filed according to the provisions of chapter one hundred and seventy-five A of the General Laws and established under the provisions of section one hundred and thirteen C of chapter one hundred and seventy-five of the General Laws shall be at least fifteen per cent lower than all rates for such coverages now in effect for the year nineteen hundred and seventy.

All the reduced rates in this section shall be deemed and accepted as adequate, just, reasonable and nondiscriminatory rates for the calendar year nineteen hundred and seventy-one, based on the current relevant costs: Any future increases in these rates shall be allowed only in relation to increases in such relevant costs; and any reduction in such relevant costs shall result in corresponding reductions of the insurance rates.

Sec. 7. Section 113B of chapter 175 of the General Laws, as most recently amended, is hereby further amended by inserting after the first paragraph the following paragraph:

In fixing and establishing classifications for premium charges to be used in connection with motor vehicle liability policies or bonds for the calendar year nineteen hundred and seventy-two and each calendar year thereafter, the commissioner shall establish reasonable surcharges, above the premium charges otherwise due, for each conviction for a moving violation committed, within the period herein specified, by the policyholder of such a policy, or the obligor of such a bond, or any other driver who resides in the same household as the policyholder or obligor and is included among those authorized to drive any vehicle covered by such policy or bond. The commissioner shall also establish reasonable discounts to be applied when neither the policyholder nor obligor, nor any other driver who resides in his household and is authorized to drive any vehicle covered by such policy or bond, has been the driver of a vehicle involved, within the period herein specified, in an accident required to be reported under the provisions of section twenty-six of chapter ninety. The period to be considered in fixing the surcharges and discounts for a calendar year shall be the

period closing on August the thirty-first next preceding the calendar year to which such surcharges and discounts apply; it shall be a period commencing no sooner than September the first, nineteen hundred and seventy and in no event exceeding five years in length; and, with respect to calculating a discount, it shall be the period commencing on September the first next after the last reportable accident involvement. In the absence of a finding otherwise by the commissioner, based on data accumulated under this merit system and such other evidence as the commissioner considers relevant and material, reasonable surcharges and discounts shall be presumed to be the following: for each conviction of driving under the influence of intoxicating liquor or narcotic or hallucinogenic drugs, a surcharge of one hundred per cent; for each conviction of speeding, a surcharge of twenty per cent; for each conviction of any other moving violation, a surcharge of ten per cent; for each full year of reportable accident involvement, a discount of two per cent.

Sec. 8. Said chapter 175 is hereby amended by inserting after section 220 the following section:

*Section 22E.* No company shall issue any policy of insurance which provides coverage against loss or damage to or loss of use of, motor vehicle resulting from collision, fire, lightning, and larceny, pilferage, theft, malicious mischief, vandalism or any other perils usually against, or which insures any person against, legal liability for loss or damage on account of the bodily injury or death of any other person or on account of any damages to property of another, arising out of the ownership, maintenance, control or use of motor vehicles, including motor vehicle liability policies as defined in section thirty-four A of chapter ninety, unless said policy contains a provision that it shall be automatically renewed by the company except for fraud, conviction for use of unlawful drugs or driving under the influence of liquor, or nonpayment of premiums. Further, no insurance company, and no officer or agent thereof on its behalf, shall refuse to issue or execute as surety a motor vehicle liability policy or bond or any other insurance based on the ownership or operation of a motor vehicle because of place or garaging of the vehicle.

Sec. 9. Section 113C of said chapter 175 is hereby amended by striking out the second paragraph, added by section 3 of chapter 643 of the acts of 1968, and inserting in place thereof the following paragraph:

No company shall be authorized to issue such motor vehicle liability policies or to act as surety upon such motor vehicle liability bonds unless it makes a mandatory offer to issue to any person purchasing such policy or bond at his option, additional coverage, beyond that required by section thirty-four A of chapter ninety, of at least fifteen thousand dollars on account of injury to or death of one person and at least forty thousand dollars on account of any one accident resulting in injury to or death of more than one person, and of the combination of bodily injury liability off the ways of the commonwealth and liability for guest occupants on and off the ways of the commonwealth, of medical coverage, so-called, and of property damage, so-called, to a limit of at least five thousand dollars, of fire and theft coverage, compressive coverage and collision coverage, so-called. The rates for other than fire, theft, comprehensive and collision insurance shall be subject to the approval of the commissioner, under the provisions of section one hundred and thirteen B.

Sec. 10. Section six of this act shall take effect upon passage; all other sections of this act shall take effect on January the first, nineteen hundred and seventy-one and for the purpose of the issuance of motor vehicle liability policies or bonds for the calendar year nineteen hundred and seventy-one all things necessary to be done prior to said effective date may be done.

Sec. 11. The provisions of this act are severable, and if any of its provisions shall be held unconstitutional by any court of competent jurisdiction, the decision of such court shall not impair any of the remaining provisions.

House of Representatives, August 10, 1970. Passed to be enacted.

DAVID M. BENTLEY,  
*Speaker.*

In Senate, August 11, 1970. Passed to be enacted.

MAURICE A. DUNAHAN,  
*President.*

August 13, 1970.

Approved, at 8 o'clock and 10 minutes, P.M.

FRANK CASPER,  
*Acting Governor.*

Senator COOK. Thank you, Mr. Chairman.

Senator HART. Let me ask Mr. Sutcliffe to address some questions to the witness.

Mr. SUTCLIFFE. Mr. McGowan, let me refer you to page 116 of the Department of Transportation's study where they present an analysis of the improved reparations system shown. The Department of Transportation lists as "Advantages of the 'improve the present reparations system' option"—“(a) it would bring reparations to some victims not now compensated, for example, those barred by contributory negligence or immunity doctrines,” and your statement mentions this advantage; “(b) compulsory, universal insurance would prevent uninsured motorists from being able to benefit from the system while not contributing to it.” In other areas of the report, the Department of Transportation study indicates between 15 and 20 percent of drivers in this country may be driving without liability insurance coverages. “(c) Delay occasioned by court congestion shown would be mitigated.”

The disadvantages of the system are listed as these :

- (a) It retains most of the costs inherent in any adversary system ;
- (b) It does not come to grips with the needs of the “guilty” victim and his dependents or survivors.
- (c) It is more likely to increase costs than decrease them.
- (d) A more efficient judicial administration may increase the litigation burden rather than decrease it since more cases can be litigated, albeit faster.

I would like to address a question to part (c) of the disadvantages. “It is more likely to increase costs than decrease them.”

According to the Department of Transportation's study, the insurance industry presently collects approximately \$14 billion in premiums and pays in benefits to policyholders about \$7 billion. The DOT report also says that there are about \$11 billion in compensable economic loss occurring each year as a result of automobile accidents.

Under the system that you advocate, would the \$7 billion of benefits increase under your particular proposal?

Mr. MCGOWAN. I think there would be a double effect, Mr. Sutcliffe. I think that the benefits would logically increase and I think the premium would possibly go down. The only trouble is that we don't have, any of us, any actuarial experience to go on regarding the no-fault system. Many claim, some of them rather sensationally, cost savings. I suggest to you, Mr. Sutcliffe, the only possible chance of reducing costs on automobile insurance is to either reduce the benefits or to reduce the expense. We maintain that our limited—

Mr. SUTCLIFFE. Is there a third alternative, reduction of the losses that are incurred?

Mr. MCGOWAN. That would be up to the enforcement authorities primarily. But within the purview of the insurance agent—we don't have any control over the enforcement, we don't have control over the manufacture of automobiles.

Mr. SUTCLIFFE. You do have control over the rating of vehicles and the charging of premiums for collision and property damage coverage?

Mr. MCGOWAN. I would suggest, Mr. Sutcliffe, that experience indicates that we have very little control over that. I am sure you have heard the companies countrywide, at least the assertion, in some cases justified, by insurance companies that they are not able to get adequate rates from State regulatory authorities.

Let me submit to you that many times I have been very critical of the companies also for some of their practices. So I am not here as an advocate of the companies, but I am certainly willing to recognize the honest problems that they have. So I don't think they really have an awful lot of control. I think the social and political pressures which we all have to deal with have a great deal more control over the rates than the companies do. But insofar as damagability and enforcement, we just don't have any control at all. But in the area of reducing expense, our plan does do that, because it eliminates a great deal of claim adjustment expenses, and it does eliminate litigation.

Again I point out that 95 percent of the cases would be handled by our particular approach. In Massachusetts, as I mentioned earlier—I don't want to take your time repeating—but one of our companies in Massachusetts did a thorough actuarial study over a 5-year basis of the application of that \$500 limit on pain and suffering, with certain other safeguards such as permanent disfigurement, and they found an actuarial savings here of between 15 and 20 percent. That is why 15 percent was built into the law, and from experience, which is only 3 months old, it probably isn't too credible, but it certainly indicates that if it continues there will be a further substantial reduction in automobile insurance premiums in 1972.

I take no position that that experience will continue, but if it does, I make the assertion that there will be a further reduction in cost.

But, Mr. Sutcliffe, let's face it. We have reduced benefits to the public, you see. We say to the public now that unless you have \$500 of medical expense or permanent disfigurement or death or a fracture, then you cannot sue for pain and suffering which you could have done before. So we have reduced benefits.

MR. SUTCLIFFE. Let me stop you right there, because I think the concept of reducing benefits, in one sense you are taking money away from people as Senator Cook has suggested, who are being compensated for much more than their economic loss; you may be redistributing those funds to people who are only recovering in higher areas of loss as little as one-third of their total economic loss. To say that we are reducing benefits may be inaccurate. We may be redistributing the benefits and making them more equitable in terms of providing benefits in relation to the loss.

MR. MCGOWAN. I agree, Mr. Sutcliffe, that we probably would redistribute the benefits, but it seems to me that unless you do retain some kind of an opportunity to go into tort liability, you are redistributing more of the benefits to the lower amounts of loss, which is really what we are frankly trying to do in Massachusetts. We are trying to make it easy for the average citizen to collect his economic loss without going to any legal expense or loss of time or waiting for the money. So we feel that with a \$2,000 no-fault provision, for example, that it is the small case that is going to be taken care of even more completely than before, rather than the larger case.

MR. SUTCLIFFE. But it is going to be taken care of at a level commensurate with the loss and not exceeding the actual economic loss.

MR. MCGOWAN. Correct.

MR. SUTCLIFFE. So that perhaps would allow for other funds—you see we have a \$12 billion loss and we have \$7 billion now finding its way into the pockets of people, not on an equitable basis. As Senator Magnuson said in his opening statement, our desire is to find an insurance

system that covers totally the amount of loss and covers it on the basis related to the individual's own particular loss. What I am trying to ask you is how are you going to bring that \$7 billion up to cover the \$12 billion loss under your plan, point 1; and, point 2, if you are able to cover through your insurance mechanism the \$12 billion loss, are you going to have to do it by raising the \$14 billion premium figure to a figure much higher?

Mr. McGOWAN. Well, in answer to the first part of your question we are going to get obviously more of the premium dollar into the hands of 95 percent of the accident victims because they are not going to have any argument about contributory negligence and are not going to be in a position where they can't afford a lawyer or can't both pursue the case through the courts. So we are going to get a greater part of the premium dollar to them.

We are going to reduce the expense factor because of the saving in litigation costs and adjustment costs. As far as the second part of your question is concerned—

Mr. SUTCLIFFE. You mentioned savings in operations cost. Under the Massachusetts proposal and your own proposal, you provide for subrogation of the insurance carriers to those no-fault claimants. This suggests to me that the companies are going to have to litigate between one another, either in a court of law or through arbitration to decide who is at fault in the accident. This seems to be a burden upon the insurance system and an added cost that you could eliminate. And, too, it seems it might inconvenience consumers who might have to participate in these proceedings before an arbitrator or in a court of law.

Could you comment on why that subrogation provision is maintained under the no-fault concept if your desire is to reduce operating costs?

Mr. McGOWAN. Mr. Sutcliffe, I respectfully suggest there is no subrogation provision in the Massachusetts law. The right of a company to pursue another company if it feels that the insured of that company was at fault is retained not through subrogation but through arbitration, and the participation of the accident victim is not required.

Mr. SUTCLIFFE. Perhaps for the record, then I could submit a special report on Massachusetts insurance law published by the Massachusetts Association of Independent Insurance Agents and Brokers which on page 13 says:

Inter-company insurer subrogation: We have already seen that a compensating first-party personal injury protection benefits to any party making a tort claim against another who is not exempt from tort liability is subrogated to the injured party's claims. Far more important, however, is the rather unique subrogation-like right between insurers set up in the new law. It is a central reason that the plan will not have adverse effects on underwriting as it has been practiced. It can, as a result, be very important to producers operating on profit or contingent arrangements.

Mr. McGOWAN. I don't have a copy of the statute with me, but I will get it for you, and the statute does go to some effort to distinguish between subrogation, as we understand it under the old law and what you refer to as intercompany subrogation. It is provided that it is handled by arbitration between the companies and not through the courts.

Mr. SUTCLIFFE. That is correct, but is that a cost necessary to the system? We are trying to save consumers' money, and I am just trying to find out about why the decision was made to preserve that operating cost?

Mr. MCGOWAN. Well, I suppose the answer that is given in the booklet—we are trying, of course, primarily to keep open markets so that we can get automobile insurance for our customers which had been rather difficult in Massachusetts prior to January 1, 1971, and I suppose the reason for it was that a company would have a better underwriting attitude if it knew that its insured, who was wrongfully and negligently injured, could possibly recover the cost of paying his claim from the other insurance company.

They have no right of subrogation against the person who caused the accident, though.

Mr. SUTCLIFFE. Doesn't this preserve the very concept in the market place right now which Mr. Klein from Consumers Union referred to yesterday as "skimming?" In other words, as you in the concluding paragraph on interinsured subrogation say, "In practical effect, this means the liability exposure of companies remains essentially as good or as bad as it was before."

Mr. MCGOWAN. Mr. Sutcliffe, let me say for the record that both our association and I personally are unalterably opposed to any cream-skimming device. We have been opposed to this in the past and we continue to be opposed to it. And that is why in our guidelines, if you note, we support Senator Hart's position on group merchandising, that if a company enters into a group that it must be required to offer insurance to all members of the group rather than further add to the residual market, which is happening in group merchandising plans at the present time. So we are opposed to that.

I do not agree that this practice of allowing a company to pursue another company to recover its loss adds to cream skimming. I think it decreases it. I think a company is more comfortable paying losses if it knows it can pursue the company which insures the party that caused the loss. This would not require in my opinion any great amount of expense, because it would not be getting into expensive legal fees, and the whole matter would be handled by paid employees of the insurance company itself.

Mr. SUTCLIFFE. How would an insurance company determine the fault of a driver who had been paid no-fault benefits? Would he have to call them in before the arbiter? How is this occurring in Massachusetts? In other words, you have two people whose losses are in the no-fault area; they are paid, and their insurers go through this subrogationlike arrangement. What is the impact upon the consumer, the policyholder?

Mr. MCGOWAN. The impact on the consumer is nil, Mr. Sutcliffe. The company has no authority to call them in. That is specifically not provided for in the statute. In other words, if it is a very complicated case I am sure they are just not going to pursue it; if it is an open-and-shut case—I am stopped at a red light and I am rear ended by Mr. Potts—I am sure they will pursue Mr. Potts' company to try to collect the money, and I believe they will collect without difficulty.

I do not believe the companies are going to get into any complicated cases because they have to go to law firms. But they do not have the right to call the consumer in.

Senator Cook. We are also saying that regardless of what kind of program one advocates, it is not a matter of somebody picking up the phone saying I have had an automobile accident; here is the extent of the damage I have suffered. After all, you are going to continue to make examinations of these things and make files of these things. To say that a determination of fault in most instances cannot be made from the record, if at least in Massachusetts 95 percent of the cases have been settled for less than \$600, is a determination that has been based on the record, and it has been based on the record that has been compiled by claims adjusters, and will continue to be done so; is that not true?

Mr. McGOWAN. This is true, Senator.

Senator Cook. This is the basis on which intercompany settlements would be presently made under an agreement I would assume, that insurance companies will make with each other to go into a State to do business?

Mr. McGOWAN. There is a distinction, Senator, between what has been happening and what is happening now. As a matter of fact, as agents at the point of sale have noticed that claims settlements are coming through almost immediately. In other words, as soon as medical bills are filed, we sometimes have a check 2 or 3 days afterward; in fact, most of the time within a week, which is certainly a remarkable phenomenon for us and which is certainly favorably impressing the public in our State so far.

But here are the differences: Under the old system the company would assign the claim to an adjuster, he would have gone out and interviewed the other party, gone to the police station, gotten the police report, gotten witnesses, and so forth. This is expensive. Under the new system all this is eliminated. All the company needs to know now really is what damage and how much the particular insured suffered as far as medical expense and loss of wages. He can inquire from the employer what the wage level was, but he would have done that under the old system also.

Senator Cook. This concept is almost on the same basis as under the workmen's compensation law. I'm interested in getting figures into the record, if we could, that show in workmen's compensation cases how many elections are made to pursue tort liability rather than settle under the present regulations and under the present figures established by the respective legislatures. Could we get that from the industry?

Mr. McGOWAN. I do not know, Senator, if those statistics would be available. I can say after 17 years in this business I have never seen one election or heard of one being made. That does not mean there have not been any. But we will certainly try to get the figures for you.

Senator Cook. I know of several that have been made.

Mr. McGOWAN. You do?

Senator Cook. Obviously because of the extent of the injury that occurred and to the extent that death occurred under the circumstances. I think it would be interesting to determine how many

elections are made under the present system and how many elect to deny the registry and pursue under tort liability. I think these figures would be interesting.

Mr. McGOWAN. Senator, we will make every effort to see if they are available.

(The following information was subsequently received for the record:)

Our investigation reveals that although there are occasional cases where the employee sues for recovery under tort liability, the great majority do not because most States do not give the employee such an option; and, in those States that do, few actually elect to sue. Unfortunately, we have been unable so far to secure any meaningful statistics on this particular subject. Perhaps an inquiry by your Committee to the American Mutual Insurance Alliance or the American Insurance Association would prove helpful.

Senator Cook. Particularly because you are offering it on the alternative.

Mr. McGOWAN. We have a little different reason. We are trying to look after the citizen who has very adequate insurance of his own. For example, in my own case I have very substantial major medical insurance and I have very substantial disability income insurance; and there are many other people who are equally well covered. We just thought that it was unfair to force such a person to buy these automatic basic coverages when he is protected already and he is paying for it.

Senator Cook. What you are saying then is this still does not eliminate an election to pursue under no fault. For instance, if you hit a Phil Hart, who is the senior Senator from Michigan, and you feel you might get a bigger recovery if you took that than you would under a no fault, that would mean, for instance, that he or I would still have to carry the maximum coverage. I have so much I do not know what to do with it, but that is because I have so many drivers in the family.

Mr. McGOWAN. That is correct, Senator.

Mr. SUTCLIFFE. To understand better your proposal on the election point, would the individual himself be able to determine whether he was going to be susceptible to tort liability? In other words, if he purchases a policy and elects to go under first-party coverage, he has insulated himself up to a \$2,000 medical and rehabilitation cost level and \$6,000 wage replacement level against tort liability; is that correct?

Mr. McGOWAN. That is correct, Mr. Sutcliffe.

Mr. SUTCLIFFE. If he has not elected that particular kind of coverage but chooses instead to stay within the present system, then he has chosen to retain the present tort liability, he has from zero to whatever the damages are?

Mr. McGOWAN. That is correct, Mr. Sutcliffe.

Mr. SUTCLIFFE. What if a person who has chosen the first-party coverages is hit by a driver without first-party coverages and the person without first-party coverages is at fault, can the person with first-party coverages sue the negligent party with third-party liability coverages only?

Mr. McGOWAN. Not if he collects his first-party coverages. In other words, if he picks up \$2,000 from his company he is prevented from pursuing up to that limit.

U.C. BERKELEY LIBRARY

Mr. SUTCLIFFE. But he does not have to prove any limits as such if he decides to go into court? You provide for court access of the people who have elected and those who have not elected, don't you?

Mr. MCGOWAN. What I am trying to say is if he has first-party coverage and takes those benefits, then he cannot pursue the other party up to those limits.

Mr. SUTCLIFFE. In your prepared statement you assert that arbitration has "proved to be a less expensive procedure to the litigants." I wonder if you could provide the committee with details of the Philadelphia plan and document that particular statement.

Mr. MCGOWAN. Yes, we can, Mr. Sutcliffe, and we will do that.

(The following information was subsequently received for the record:)

Enclosed is a report of the Arbitration Commission<sup>1</sup> covering the first ten years of that city's compulsory arbitration program, which began on February 17, 1958. This report unquestionably proves the merit of the system. On page 232, for example, the average cost per case is set at \$62.00 and the statistical tables attached to the report attest to the success of the program (since this report was prepared, the disposition of cases has improved and the amount in controversy increased to \$3,000). More recently, a *voluntary* arbitration system covering all cases involving claims between \$3,000 and \$10,000 has been added in Philadelphia. Cases above \$10,000 have been identified as "major cases" and assigned for trial jury to certain well-qualified judges on an individual calendar basis. This lifts the serious case out of the morass of smaller cases and enables it to reach trial at an earlier date. Meanwhile, in the cases which are not identified as major cases, the parties have been invited to sign stipulations agreeing to arbitrate under the same rules as the compulsory arbitration system. Enclosed is a brief summary of the \$10,000 arbitration program prepared by the administrative judge.<sup>2</sup> Figures from this report show early signs of success and every expectation is that the backlog will no longer exist in Philadelphia within a year. Also enclosed for your information, is a set of statistics on the compulsory arbitration program and an article, "Arbitration: The Philadelphia Story," reprinted from the *Journal of American Insurance*.<sup>3</sup> Finally, if the Commerce Committee is interested in having this unique system more fully explained, we have been informed that knowledgeable attorneys and officials of the Philadelphia Common Pleas Court would be happy to appear before the Committee.

Mr. SUTCLIFFE. If you could also include a comparison of the premium levels in Philadelphia and the court congestion in Philadelphia in comparison with other similar metropolitan areas we would certainly appreciate that.

Mr. MCGOWAN. Yes, we will do that, Mr. Sutcliffe.<sup>3</sup>

Senator HART. In your statement you say:

Insurance companies must be allowed a certain amount of freedom in the marketplace if the entire problem of automobile insurance cost and availability is to be solved.

A couple of years ago New York adopted the open competition rating system. The assigned risk plan of New York as sent to the committee's staff showed that for the first 3 months of last year there were about 115,000 private passenger cars in that plan. For the first 3 months of this year that figure has gone up to roughly 214,000. Sixty percent of these cars are clean risks, no traffic accident history at all. Wouldn't that data suggest that given the freedom-in-the-marketplace concept the insurance agent certainly has not solved the availability problem? Do you have any reaction to my reaction of those figures?

<sup>1</sup> See p. 504.

<sup>2</sup> See p. 536.

<sup>3</sup> The information was not available.

Mr. McGOWAN. I would certainly agree in New York they have not solved the voluntary market problem, Mr. Chairman. One of the problems with open competition is if the rate adequacy situation in a particular State is very bad, in other words, if there have been no rate increases allowed over a period of 4 or 5 years, or 3 or 4 years, as, for example, Massachusetts and to some degree New York, you build up a situation where when you throw it into open competition the companies have to come up or will come up almost immediately with rate increases which are politically and socially unacceptable.

In California open competition has worked beautifully. Everybody seems to be very happy with it, including the consumer, but the California plan began at a time when the rates in California were already adequate. The result is you have quite a variation of competitive rates in the State of California, differences ranging up to 20 percent. So you really have a good competition situation. But in Florida and New York where there have been inadequate rates for a number of years, the companies, of course, in both cases started to recover their position somewhat and got into a real difficult situation politically.

All of us are quite upset about the assigned risk situation, particularly in New York, the number of people that are in it, as you say, that are accident free. I suspect at some point in time, Mr. Chairman, that your committee will well be considering what solution we are going to have for the industry. Usually we wait for these problems to become too severe to solve. What bothers me more and more is legislation being enacted which requires a company to take insurance, prohibits them from nonrenewing insurance or from canceling insurance regardless of loss experience, which I will also agree is going to continue to be a matter of legislative action because the public must, I believe, have access to insurance regardless.

Therefore, the companies are going to lose their right of selection, and I am willing to accept that, but since they are, I submit that there is either going to have to be some kind of subsidy to take care of the social and political needs which they are going to satisfy, because I do not think they are going to be able to get adequate rates in the States which will compensate for the fact that they no longer will have the right of selection.

So this is part of the problem in New York. The companies are taking a defensive position, which I suspect will be self-destructive, of putting an awful lot of business in the assigned risk pool that probably should not be there.

Mr. WALTON. If you could move those 60 percent to Michigan, we could take care of them all right there without the assigned risk plan, although the number of participants in an assigned risk plan increasing, I am sure, but I do not think you will find anything like 60 percent of them with an accident-free record. They are in the plan because of the records they do have, and part of our suggestion has something to do with the people that are driving. This is something we feel real strongly about. We feel a lot of our problems would be solved if we had more stringent licensing and who is given the privilege of driving.

But move them to Michigan, we can take care of that 60 percent.

Mr. SUTCLIFFE. One more question for the record. In your statement you mention the fact that extraterritorial coverage is now a normal part of most insurance policies and that this should present no problem in

a reform situation. Suppose that a State-by-State approach to insurance reform is taken so that the general uniformity of the tort law, albeit there are differences now that exist, but the general uniformity of the tort law is modified in a number of jurisdictions, what practical problems from the standpoint of an agent and an insurance company and a policyholder are there for writing extraterritorial coverages that would protect the policy holder when he is outside his own State and he is involved in an automobile accident, and what problems would there be in the conflicts of laws situations where you are trying to determine the laws of which jurisdiction apply to a particular accident?

Having formulated that question in rather general terms, let me see if I can bring it down to a specific example. Suppose the NAMIA plan is adopted in New Hampshire and a New Hampshire driver has an accident in New York. Under the NAMIA plan would he be liable to damages to the other driver if he were found at fault?

Mr. McGOWAN. Yes, he certainly would. I do not see where there is any great problem on a State-by-State solution, and I think it has some advantages in experimentation. As a practical matter, under the Massachusetts plan no matter where I drive in the other States or Canada; I am covered under my basic protection plan. So I would be covered under the so-called no-fault section to the limits of the policy, but I am also covered for tort liability for whatever liabilities I choose to carry or any injury or damage I cause to anyone else.

In other words, I still have the same automobile contract I had before. The only difference incorporated into that contract is what we call basic protection or no-fault, whichever way you want to describe it.

I just do not understand why there would be any problem. There is no problem as it exists now, no matter which State I drive in, and I do not see where there would be any problem elsewhere. For example, if two out of State drivers come into Massachusetts, one from New York, one from New Jersey, and collide with each other, obviously their particular policy applies and the liability question would be the problem. Neither one of them have no-fault.

There is one exception to that in that under our law they would not be able to sue in our courts for pain and suffering if there is medical expenses that exceed \$500, because that happens to be a peculiarity of our law. Insofar as being protected, they are protected whether the accident happens in Massachusetts or elsewhere.

Mr. SUTCLIFFE. You do not see any problems with availability of courts or choice of laws when jurisdictions have differing concepts of auto accident recovery?

Mr. McGOWAN. I really do not, Mr. Sutcliffe. We have some differing concepts now, of course, but whatever gap might exist in a different approach to no-fault seems to me will be picked up by the liability provisions, which might be one of the advantages of retaining the tort liability system.

Senator Cook. If you had two parties each from different States other than the State of Massachusetts, the convenience would be not to sue in Massachusetts anyway under the diversity of citizenship, would it not, so we really have no problem?

Mr. McGOWAN. I see what you mean, Senator. I agree.

Mr. SUTCLIFFE. I suggest perhaps for the record we can supply some choice of laws problems which would be created on a State by State basis.

Senator COOK. I do not disagree with that, but I think you face the situation where he already has two options. He already has the option to sue in his own State or to sue in the State of the residence of the other operator. If there happen to be any problems involved in his own State, he can sue in the other. If there are problems in the other State he can sue in his own.

Mr. SUTCLIFFE. The problem would arise if he chose a district where the choice of rules law said that you must apply the laws in the jurisdiction where the tort occurred, and if that was the situation you would have to apply Massachusetts law which does not apply for tort liability at certain levels. So there would be some confusion.

I think the other point I would like to ask is under a national no-fault approach with a residual tort liability as proposed in S. 945, would it be necessary to have an extraterritorial policy as such or tort liability protection for those losses covered on a first-party basis? For example, in the Massachusetts situation you have to have your first-party coverage, your tort liability coverage above the first-party coverage; you also have to have extraterritorial coverage for all amounts because you do not know what jurisdiction you might have an accident in and be liable for. Under the Hart proposal you would not have to have liability insurance for those coverages above the first-party basis. Would there be any cost advantages to proceed under the national approach where your exposure to liability is only above the first-party coverage?

Mr. MCGOWAN. Of course the exposure to liability is only above the first-party coverages in our cases, too, but the answer is substantially lower. Mr. Sutcliffe, in all honesty, I do not know whether there would be any cost advantages or not. We do not have any figures to know whether there would be any cost advantages under a no-fault system altogether. I would have to say I just do not know the answer to that question. I would like to say, though, Mr. Sutcliffe, we would like to pursue that. It expresses a new thought to us.

Please understand that we are not here in an adversary position. When I said in my statement that we are really anxious to find a solution that will be best for our customers, we really mean it, because if we do not we are not going to be in this business very long, and I like this business. It is just that we have a difference of opinion in some areas as to how best to arrive at that kind of solution. But I tell you we will pursue that question. Perhaps you have already pursued it, but we would like to see what we can come up with, and if we come up with anything meaningful I am sure we will submit it to your committee.

Mr. SUTCLIFFE. I would certainly appreciate that. Let me make clear for the record any questions posed are not in an effort to create an adversary environment but only to learn more about this very difficult problem.

Mr. MCGOWAN. That is just what we are trying to do, too.

Mr. SUTCLIFFE. Thank you.

Senator HART. Gentlemen, thank you very much.

Mr. MCGOWAN. Mr. Chairman, I want to thank you and I want to tell you very sincerely we certainly appreciate your patience and courtesy. I am sure we have taken an awful lot of your valuable time, and you have been very courteous to us and we appreciate it.

(The statement and exhibits follow :)

STATEMENT BY ROBERT V. MCGOWAN, PRESIDENT NATIONAL ASSOCIATION OF  
MUTUAL INSURANCE AGENTS

Mr. Chairman and gentlemen of the committee, my name is Robert V. McGowan of North Attleboro, Massachusetts. I am the owner of the R. V. McGowan Insurance Agency, Inc., in North Attleboro, which I founded and have operated since 1954. I am also the current president of the National Association of Mutual Insurance Agents, an organization of more than 18,000 independent property and casualty insurance agents with members in nearly all fifty states, and with headquarters in Washington, D.C. Accompanying me here today are Lee E. Walton of Jackson, Michigan, Immediate Past President of our Association and Chairman of our Federal Legislative Steering Committee, and George G. Potts of Washington, D.C., our Director of Government Affairs.

The primary objective of our Association is to do all things necessary to help its members better serve the public. In our 40-year history we have demonstrated a willingness and ability to work for needed change within our industry. We have advocated positive steps for improving our product, to the end that it will provide the best protection at the lowest possible price to the insuring public.

It has been reported that nearly 70 percent of the property and casualty insurance written in the United States is handled by independent insurance agents. That figure suggests at least two important and related ideas: That we have almost constant contact with a large majority of the insurance-buying public; and also that we have first-hand feedback of their views on what is good and what is bad about our business.

I cannot overemphasize the influence that this knowledge has had in defining the position of our Association on the matter of automobile insurance reform legislation which is before this Committee, and which I am privileged to bring to your attention at this time.

Mr. Chairman, let me say at the outset that automobile insurance is no longer a product that one may choose to buy or not to buy; it has become a practical necessity. The advent of compulsory insurance and financial responsibility laws, plus the increasing incidence of automobile accidents and the larger judgements resulting from them, require the purchase of insurance to protect one's property and standard of living. It is little wonder then that the principal product sold by the independent agent is automobile insurance.

On previous occasions at House and Senate hearings there have been implications, as well as testimony, challenging the need for the services of the agent in the marketing of automobile insurance. This proposition is completely unknown and irresponsible. To fully appreciate the many and varied implications of the independent agent's involvement in the sale and servicing of automobile insurance, I ask for permission to insert into the record at this time as Exhibit "A," a description of just some of the myriad duties performed by the independent agent in looking after the insurance needs of his automobile policyholder.

I would call your attention to one of these areas which I feel is directly relevant to the subject under discussion here, and that is the contributions made by our members through their state/regional and national associations as well as individually, to programs concerned with safety and protection of the consumer. They have supported the leading safety organizations in the nation, including the National Safety Council and the Insurance Institute for Highway Safety, and annually distribute literally millions of safety messages to the many clients they represent. Many of our state/regional associations maintain speakers' bureaus and provide, without cost, a variety of programs on safety and insurance for service clubs and other groups. The independent agent is indeed a vital part of the significant endeavor to promote a safer America.

With these few introductory remarks, Mr. Chairman, I hope I have conveyed to the Committee why the independent agent is so deeply concerned with seeking meaningful solutions to automobile insurance problems. In the final analysis, the insurance business is a business of trust, principally because of the intangible nature of the insurance contract, and the independent agent who sells and services that contract indeed becomes the contract himself.

On that basis, I hope I am not being too presumptuous when I say there is probably no one in this room today who recognizes the need for change in our present system of compensating auto accident victims more than the independent insurance agent. However, it is just as true that there are widely differing views in this room as to the degree and the means of bringing about that change.

For example, S. 945 calls for the complete abolition of our present tort liability system, in favor of a "pure" no-fault system. Moreover, this proposal in effect would turn over regulation of the automobile insurance business to the Federal Government. The National Association of Mutual Insurance Agents unalterably opposes these concepts.

All of us are aware, I am sure, of the principal arguments put forth by the proponents of no-fault automobile insurance: lower costs to the insurance buyer; faster payment of benefits; assurance of the availability of the insurance; relief of court congestion; etc. But I suggest, Mr. Chairman, that as commendable as these goals are, implementation of a complete no-fault system in no way guarantees their achievement. In fact, at this point in time at least, we see very little chance of all these goals ever being reached under such a system.

It seems to us that to do away with the tort liability system and replace it with a completely different and untested concept which all the states must adopt almost immediately is to invite chaos. A more prudent approach would be to begin on a limited basis and permit the system to change in an evolutionary manner.

#### MOTORISTS' INSURANCE—PROTECTION PLAN

I would like to propose to you a program which our Association earnestly believes can go a long way toward solving the present automobile insurance problems and, at the same time, ultimately guarantee lower costs, faster payments, readily available coverage, and less crowded courts. The National Association of Mutual Insurance Agents has developed a program, entitled "Motorists' Insurance—Protection Plan," which we recommend be given careful consideration by this Committee.

This plan is a comprehensive package of legislative proposals to be enacted at the state level. It is designed to provide speedy, automatic *basic* injury compensation for all auto accident victims, and to afford the greatest possible protection for the nation's motorists by implementing stringent driver and highway safety measures and improving the present legal system. A copy of the program is attached to my statement as Exhibit "B," and I respectfully request that it be included in the record at this time.

I would like now, Mr. Chairman, to go through each section of our proposed program and to explain how and why we feel this plan is capable of bringing about the desired changes in our present system.

#### SECTION I—HIGHWAY SAFETY

Section I calls for more stringent laws aimed at promoting highway safety. In the discussions and writings of those who propose no-fault systems, usually little if any mention is made of improved highway safety. Some cynically seem to consider the highway accident as an inevitable occurrence. There is no question, however, that a reduction in the number of highway accidents would go a long way toward curing many of our problems, such as the high cost of automobile insurance and the impact of auto cases on court work loads.

Independent insurance agents have long been concerned with highway safety, and we are convinced that meaningful programs to prevent highway accidents would have worthwhile results. For example, our Association several years ago actively worked to get so-called "habitual offenders" laws enacted in New Hampshire, North Carolina and Virginia. In the latter state, we are informed that many hundreds of habitual traffic offenders have been removed from the highways since the measure was passed. Hopefully, studies will be made that can reveal a significant drop in accidents directly attributable to the stringent law.

Mr. Chairman, we are convinced that much more could be done to improve highway safety if greater concentration were placed on the motorist as perhaps the major cause of highway accidents. Studies have shown alcohol and drug use as inordinate causes of traffic accidents. We maintain that driving is a privilege and not a right. Accordingly, our plan sets forth certain proposals to deal with the accident producers, and we will continue to support, as I outlined earlier, all meaningful legislation to protect the careful motorist from those who abuse their driving privilege.

Still other studies have shown that many drivers do not have the mental or physical capacity to operate today's high-powdered vehicles. In addition, many

vehicles are allowed to fall into such a state of disrepair as to make them a menace to others. We maintain that just as pilots and aircraft are given periodic examinations to assure air safety, motorists and vehicles should be inspected regularly to improve highway safety.

Automobile safety devices, such as safety belts and motorcycle safety helmets, have been shown to be extremely effective in the prevention of highway injuries and deaths. In this section of our plan, we propose and will support measures to require installation and mandatory use of such devices.

Finally, we are proposing measures which we believe will enable those persons charged with the enforcement of our traffic laws to be more effective.

Mr. Chairman, we do not claim that the proposals in Section I of our plan are the ultimate solution which will prevent *all* highway accidents. Much more can and should be done, for there is a definite need to improve the highways and the vehicles which we use. In the latter case, of course, there is legislation now before this Committee. I will comment later on that legislation. In the meantime, suffice it to say that our Association will concentrate its safety efforts on the driver, for we believe this is an area in which we can be most effective and an area which has been given far too little attention up to now.

## SECTION II—THE LEGAL SYSTEM

Section II calls for reform of the legal system as it applies to automobile insurance claims. No-fault advocates often portray delay in the courts as to make it appear that every litigant in every jurisdiction must wait many years to have his case brought to trial. They contend that this delay would disappear if automobile accident cases were removed from the courts.

From various studies conducted to date, it has been concluded that such delay does not exist in every court and affect every litigant. Nevertheless, it is apparently a major problem in many metropolitan jurisdictions which handle cases involving a considerable percentage of the nation's population, and to that extent, can be considered a serious problem.

But simply removing automobile accident cases from the courts will not solve the problem of delay where it does exist. If such cases were removed and no other remedies made, any relief in the judicial workload would be temporary, since continued growth in population would produce more cases of other varieties to burden existing judicial manpower. Thus, it is apparent that courts and judicial personnel must be increased to meet population growth, just as utilities and other public services expand their facilities to meet new demands.

In addition, we recommend employing a system of mandatory arbitration of all lawsuits involving claims under \$3,000. Such a system has been in use in Philadelphia for some time now and has been found to successfully reduce court delay, has proved to be a less expensive procedure to the litigants, and has resulted in the equitable disposition of smaller cases. We feel its more widespread use would prove equally successful in other jurisdictions. By removing these smaller claims from our regular court dockets—especially since many legal experts maintain that such suits constitute a great percentage of the total auto accident cases—the legal process would be markedly improved.

## CONTINGENT FEE SYSTEM

A second area of our legal system in need of reform is the controversial contingent fee system. It has been said, and rightly so, that the contingent fee system provides the means through which a man of modest means may gain legal representation by a highly skilled and competent trial counsel. However, others contend that it is unfair for a portion of one's legal recovery to be shared with the lawyer who represented him.

In our opinion, the contingent fee has a place in our legal system, but because it is often misunderstood by the client and sometimes abused by the lawyer, it must be effectively regulated. Our plan proposes to do this by placing control of the size of the contingent fee and supervision of its use in the hands of proper legislative or judicial authority.

It also seeks to correct some of the misunderstanding by requiring fee arrangements and closing statements to be in writing, and by requiring the client to sign the agreement and be given a copy of the closing statement.

If such remedies are undertaken, we are reasonably certain they will bring about a meaningful reduction in the "cost" of the tort liability system.

## COLLATERAL SOURCE RULE

There is no question that the Collateral Source Rule has a marked effect on the problem of automobile liability insurance cost. Actuarial studies indicate that elimination of double payment of certain items in the average personal injury claim would result in premium savings of between 15 and 19 percent. These savings are based on estimates that between 70 and 85 percent of the American population is covered by collateral benefits providing medical and hospital costs, wage continuation and the like. With this figure constantly rising, it means that at least seven or eight of every ten successful claimants will recover twice or more for some economic losses.

Here is an example of why the rule leads to inequitable results: The plaintiff is allowed to introduce evidence of the economic "loss" sustained as a result of his injury, such items as expenses for medical treatment, hospital and nursing care, rehabilitation services and "lost" wages. Even if all these claimed expenses have been completely paid to the plaintiff at the time of trial by insurance or other collateral sources, the defense is *prohibited* from introducing evidence of such payments. Thus, the jury is led to believe that the plaintiff had to pay these expenses personally or that he has been subjected to continuous financial worry because they are still unpaid at the time of trial.

Our proposal would permit the jury to be given *all* the facts about the case, including evidence of remarriage of a surviving spouse, which is now generally inadmissible in actions for wrongful death.

We have faith in the jury system and believe that, given all the evidence, an equitable determination of actual damages will be made. To this end, our plan proposes that the Collateral Source Rule be modified to allow the introduction of all evidence relative to the nature and extent of the benefits and services received or to be received by the claimant. If this is not done, we feel the cost to the insurance-buying public will become even more burdensome.

## CONTRIBUTORY NEGLIGENCE

Another change needed in our legal system in our opinion involves the rules of contributory and comparative negligence. In most states, contributory negligence of any kind on the part of the person seeking recovery for damages sustained, bars his recovery. In a few states, the court (or jury) is permitted to determine the percentage of total negligence attributable to *each* party. If, for example, the plaintiff is found to be 30 percent negligent, he may recover up to 70 percent of the total amount of damages sustained.

Of those states now employing the comparative negligence rule, the one used in Wisconsin, which has some 40 years of practical operation and judicial interpretation, is said to be preferable by legal experts. We strongly urge the adoption of the Wisconsin comparative negligence rule wherever practical.

## FRAUDULENT CLAIMS

Still another improvement called for in the legal system in our opinion is the imposition of strict sanctions upon those who intentionally make false or fraudulent claims for personal injury or property damage and upon those who assist them in such action.

Unfortunately, some persons look upon the personal injury reparations system as a means of making easy money. Although the number of false or fraudulent claims made annually is undoubtedly small in comparison to the total number of claims, they do constitute a serious threat to the integrity of our legal system. The dollars they take from the system are at the expense of the honest insurance-buying public and those whose personal injury claims are valid.

The only significant means which can be employed to combat the filing of false and fraudulent claims, it seems to us, is to provide stringent penalties for those who engage in this practice. Our Association's plan therefore proposes that where local laws are not adequate to cope with this problem, strong legislative measures be enacted.

## OTHER REFORMS

Finally, we believe that several other more technical improvements in the legal system should provide significant impetus to solving the problems of our automobile reparations system. The historical "ad damnum" clause—the means by which the litigant could be shown to be demanding monetary damages instead

of some other form of relief—has given rise to much abuse and dissatisfaction and should be eliminated. It simply has no place in a modern legal system.

Also, those practices and procedures which provide for limitation of the right to voluntary dismissals or non-suits, the right to a split trial on issues of liability and damages, modification of appeal bond rules, summary judgment, mental and physical examinations of litigants, demands to admit the genuineness of documents or relevant facts, and offers of settlement, judgment and damages—these should be adopted in those jurisdictions which do not now have such rules or which have rules which are not as workable as those proposed here.

### SECTION III—THE REPARATIONS SYSTEM

Section III, Mr. Chairman, is perhaps the real heart of our proposed program. It provides for some significant changes in our present system for compensating auto accident victims. If adopted, in our opinion, it would assure speedy, automatic *basic* injury benefits for all automobile accident victims, but with a minimal disruption of the important tort liability concept.

Under the NAMIA plan, every automobile liability insurance policy covering any non-fleet private passenger motor vehicle would include the following minimum benefits, payable immediately *regardless of fault*:

(1) Medical and hospital expense coverage up to \$2,000, subject to an optional \$250 deductible; (2) disability coverage of 85 percent of gross income lost, commencing 30 days after the accident and continuing for 52 weeks and subject to a \$500 per month maximum or a total of \$8,000; (3) uninsured motorist coverage of at least \$10,000 per person and \$20,000 per accident; and (4) accidental death benefits of at least \$5,000 when the death is a direct result of the accident.

However, the policyholder would have the right to reject the automatic coverages listed above for himself and members of his family. Where a guest passenger is concerned, these coverages would not apply if they were provided under his own auto insurance policy.

It is claimed that a major problem exists with relation to the number of persons who are injured in motor vehicle accidents and receive little or no compensation for the economic loss they suffer. While we recognize the existence of some inequities in the present system, we are opposed to the elimination of the fault system and the loss of the concept of personal responsibility for fault in accidents that goes with it.

On the other hand, as independent agents who come into daily *personal* contact with insureds who are victims of automobile accidents, we are well aware of the value of a system which would provide for *immediate and automatic* payment of basic personal injury benefits, *regardless of fault*. This we have proposed in our plan.

Again, however, we do not propose that the purchase of such coverage by the policyholder be *mandatory*. Many of the proposals which are now, or will be, before this Committee seek to force all motorists to purchase these *first-party* coverages as a condition to being permitted to operate a motor vehicle. Under such plans, no provision is usually made for the responsible motorist who has adequately protected himself and his family against such losses through other sources of indemnity. There is no way for him to avoid purchasing what amounts to unneeded coverage. He is forced to pay another premium for it.

The plight of this "overinsured motorist" is further complicated under some "pure" no-fault plans which call for a collateral source setoff. With a setoff, the motorists who sustained medical and hospital expenses as the result of an auto accident would not recover those expenses under his "pure" no-fault automobile policy if, for example, they had been paid by his separate medical and hospital insurance policy.

The net result under these circumstances is that the automobile insurance policy becomes *secondary* instead of *primary* coverage. Presumably, this is the area where the proponents of a complete no-fault system expect to realize cost savings; in effect, it is simply a matter of *less coverage* being provided by one's automobile insurance policy for *less money*.

Furthermore, it seems to us grossly unfair to force a person to pay for first-party coverage under which he will not be able to recover. Such persons will actually subsidize those who do not carry additional insurance. Even in the absence of the collateral source setoff, it seems inconsistent to us for plans which

are offered for the stated purpose of reducing the cost of automobile insurance, to force persons instead to buy protection they do not need.

Thus, we propose to give each policyholder the option to determine for himself whether the coverage offered is needed for his own protection and that of his family. He would not be forced to pay an additional premium for unneeded coverage. It should be noted that our proposal does not give the policyholder the right to reject the coverage available for the protection of guest passengers who are not otherwise covered.

#### PAIN AND SUFFERING

The entire area of damages for pain, suffering and inconvenience has been a major subject of debate for years. Critics of such awards claim that there is a tendency to overdramatize and exaggerate automobile accident injuries in order to collect the largest sums possible. And now many of the proposals which seek to "reform" the existing automobile accident reparations system call for a limitation of the right to recover such damages. It is even suggested by some that the right of recovery should be eliminated completely.

While we agree that automobile insurance costs could be lowered if the recoverable damages for pain, suffering and inconvenience were in some way reduced, we cannot go along with those who would *abolish* such recoveries altogether. On the contrary, we believe that pain, suffering and inconvenience are a very real and important part of the determination of damages in personal injury cases and should continue to be compensable for all such victims.

A person who suffers such injuries as the result of the carelessness or intentional conduct of another, sustains a loss as real as the hospital and medical expenses he incurred. He should not be denied recovery for the pain, suffering and inconvenience he has endured, simply because its elimination might lower insurance costs. There is, of course, an element of uncertainty in deciding just how much a person has suffered, but this is also true of the entire damage picture when money is offered to people for their injuries. Money cannot replace a lost limb or eye but there is simply no other measure yet devised.

Accordingly, we feel that some objective criteria should be established in determining this issue and it should be subject to reasonable limitations, especially in the less serious cases. Thus, our proposal suggests the following standards for pain, suffering, and inconvenience be adopted for all motor vehicle accident cases:

Up to 50 percent additional damages when medical and hospital expenses amount to \$500 or less;

Up to 100 percent additional damages when medical and hospital expenses exceed \$500.

In cases of death, permanent disfigurement, loss of limb, permanent loss of a bodily function and other exceptional circumstances, these standards may be raised by the court.

Until a better means of determining such damages is conceived, we believe these standards will prove fair and equitable to all concerned, and will at the same time provide reasonable safeguards against those who would attempt to profit from such injuries.

#### OTHER FEATURES

There are several other key features in this section which should be called to your attention:

Excluded from coverage are those persons who have committed certain specified acts in conjunction with the operation of the automobile at the time they were injured, such as intentionally injuring themselves, driving under the influence of alcohol or narcotics, operating without a valid license, etc.

Insurance companies are permitted—in fact encouraged—to offer broader coverages than the minimums we have stated here, and it is anticipated that healthy competition will provide a wide choice of higher limits first-party coverages for those who desire them.

After a claimant has been paid the automatic basic personal injury benefits, his insurance company may seek reimbursement from the party at fault (if any) or that party's insurance company, and the issue of liability and reimbursement between insurance companies should be decided by mandatory inter-company arbitration, thereby reducing expenses and the burden on the courts.

When insurance companies make advance payments and settlements to the

insured policyholder, such payments and settlements should be credited against any subsequent recovery by the policyholder and should not be construed as an admission of liability on the part of the insurance company.

Loss of income damages should be defined so that juries can take income tax savings into account when they are called upon to set damage awards.

#### SECTION IV—OPEN COMPETITION

Two major areas of concern both within and without the insurance industry are dealt with in Section IV of our proposal.

While opinion within our own Association is still rather sharply divided on the question of "competitive" versus "prior approval" rating laws, the majority of our board of directors felt that insurance companies must be allowed a certain amount of freedom in the marketplace if the entire problem of automobile insurance cost and availability is to be solved. Thus, our plan calls for enactment—in those states in which it is warranted—of competitive rating laws in order to assure the public of the lowest possible price, best service, latest innovations and coverage availability.

It should be noted, however, that unlike some present competitive rating laws, our proposal requires that policy rates be submitted to the State Insurance Commissioner for his information and that the Commissioner approve reasonable rules and statistical plans which must be used by insurance companies in recording and reporting their loss and expense experience.

It seems to us beyond debate that the state authority charged by law with the responsibility for regulating rates must have full and complete knowledge of the rates being used and of the loss and expense experience upon which such rates are based. He should have all this information readily at hand, without the necessity of sending examiners into company offices to obtain it. Nor should he be forced to tell inquiring citizens that he has no record of the rates being charged.

#### POLICY CANCELLATIONS

A second area of concern is the well-publicized practice of automobile insurance policy cancellations. The NAMIA plan outlines what we believe to be a practical approach to this problem—one which more and more insurance companies are adopting: Following a reasonable underwriting period, the policy may be cancelled by the company during its term *only* for nonpayment of the premium and suspension or revocation of the driver's license or motor vehicle registration. This applies to either the policyholder or any other operator residing in the policyholder's household or who customarily operates the automobile.

Our proposal further provides for specific notice to the policyholder by the insurance company of its intention to cancel or non-renew the policy, and that reasons for such actions be provided to the policyholder upon request.

Mr. Chairman, the broad package of proposals we have made here is offered as a balanced blending of the various points of view on how best to improve our existing automobile insurance reparations system. It encompasses what we believe to be the best features of many of the proposals being made. Admittedly, it is perhaps not exactly what any one segment of our industry would like to have, but we feel it does offer an accommodation for everyone concerned.

A virtue of our program is that it will allow for a major step forward without burning our bridges behind us. Moreover, it allows for future testing so that we may observe and evaluate public acceptance without losing the desirable features of the present system and without being committed to an irrevocable course. We offer it as a sound, *evolutionary* approach to improving the auto insurance reparations system.

#### IMPLEMENTATION

And now, Mr. Chairman, I would like to offer to this Committee what our Association feels is the most plausible method for implementing our program.

In the first place, it should be emphasized that we firmly believe that such a program can and should be implemented at the state level. We agree with Secretary of Transportation Volpe that the "sense of the Congress" be "subject to the admonition . . . that the Congress cannot, and will not, long ignore the need for evolving new and updated approaches to insurance and accident compensation," and that operation and regulation of the automobile insurance business should continue to be by the private insurance industry at the state level.

However, we disagree with the Secretary and others who apparently feel that

a national "pure" no-fault automobile insurance system is both desirable and inevitable. To the contrary, we see no concrete evidence that such a system is in the best interest of all concerned, particularly the insurance-buying public. We believe that the public does not really want a virtual elimination of the present tort system in favor of "pure" no-fault. What it does want is change for improvement—and that is what we offer here today.

Accordingly, we suggest the following four-step approach for implementation of NAMIA's "Motorists' Insurance—Protection Plan":

(1) The Congress should adopt a "Concurrent Resolution" expressing its intent that the states enact, no later than *July 1, 1974*, legislation establishing a private industry-administered and state-regulated automobile insurance reparations system built upon certain of the principles enunciated by the Department of Transportation Study and embodying all of the features of the NAMIA program.

(2) Interested organizations—such as the Council of State Governments, the National Association of Insurance Commissioners, and the various insurance associations, including our own—should be encouraged to work together to draft model legislation based on the "sense of the Congress" as a guide to the states in developing their statutes.

(3) The Department of Transportation should be directed to monitor state actions and to issue periodic reports analyzing the progress being made by the states.

(4) On or after *July 1, 1974*, the Department of Transportation should submit to the Congress a complete report on action by the states in adopting such an automobile insurance reparations system by statute, so that the Congress may be in the best possible position to take whatever action it deems necessary and appropriate at that time.

In adopting a "Concurrent Resolution," we suggest that the Congress give careful consideration to the general approach contained in House Concurrent Resolution 241, but with appropriate modifications that would reflect the approach we have outlined to you here today.

As President of the National Association of Mutual Insurance Agents, I pledge the complete support of my Association in any and all endeavors to enact such a program in every state by 1974.

I urge, Mr. Chairman, that this pledge not be taken lightly. Our Association made a similar promise some 17 months ago to this Committee in connection with a proposal to establish the Federal Insurance Guarantee Corporation. In the intervening months, efforts by our Association and others have resulted in passage of insolvency laws in 33 states to date, and we are continuing our efforts in the remaining state legislatures.

Based on our recent successful experience with state insolvency legislation, and given this period of time within which every state legislature will have had at least one full regular legislative session to act on reform of the automobile insurance reparations system, I am confident that a favorable report can be made to the Congress by *July 1, 1974*.

This proposed approach, Mr. Chairman, would in our opinion achieve the basic goal of establishing an improved automobile insurance reparations system throughout the country; but at the same time it would preserve the traditional roles of the states and the private insurance industry. Equally important, moreover, it would allow the Congress of the United States to fulfill its responsibility to the American motoring public.

#### STATE VS. FEDERAL REGULATION

Much has been said about the advantages of a federal program over programs developed and regulated at the state level. Emphasis has been put on the efficiency and economy of uniformity, on the need for prompt action, and on the record of the states in comparable undertakings such as Workmen's Compensation. Certainly there is something to be said for these arguments, but in my judgment the record of the states, for the most part, is favorable when all factors are considered.

The Congress in its wisdom in 1945 passed Public Law 15, better known as the McCarran-Ferguson Act, which left the matter of insurance regulation to the states, subject to some restrictions. Since that time, the field of regulation has been a changing, evolving phenomenon for the states. But while these changes have been taking place, the industry has continued to function soundly and properly. And the regulation of our industry by the states has maintained a level of effectiveness at least equal to that of any comparable industry.

On the other hand, during this same period, the Federal Government has had the opportunity to perform in the fields of Medicare and welfare—both somewhat related to insurance. I would suggest with all respect that the federal performance has not proven superior in these fields.

On the subject of the Federal Government's performance in the regulatory field in general, I ask permission at this time to enter into the record as Exhibit "C" a copy of a very perceptive article on the subject which appeared in the February, 1971, issue of our monthly magazine, *Mutual Review*. It was written by Mr. Louis M. Kohlmeier, Jr., who has been a Washington correspondent for the *Wall Street Journal*, and in 1965 received the Pulitzer Prize for national reporting. He is also the author of "The Regulators, Watchdog Agencies and the Public Interest," published by Harper & Row in 1969.

We believe Mr. Kohlmeier shares our belief that the state approach to regulation of an industry such as ours is preferable because it is flexible and responsive to geographic and individual needs; an opportunity for research, for innovation and trial and error.

The important thing is that if one of the fifty states undertakes an experiment and fails, it has not brought the whole country down with it. If, for example, the Massachusetts no-fault experiment is successful, we have a good foundation on which to build for the other states. If it is not, we have the opportunity to adjust to the mistakes that may have been inherent in that program.

Of equal importance is that the insurance industry, under state regulation, has been free to adjust at the local level to needed innovations brought on by a constantly changing economy and population. The automobile insurance policy itself has evolved from a rather simple contract to a more streamlined version to meet today's needs. The Family Automobile Policy is a good example. It is designed for the modern family in which two or more cars is not uncommon. Moreover, these policies are universal in concept. In my own state of Massachusetts, for example, today one buys an automobile insurance policy that takes care not only of the statutory requirements there, but all the requirements of the other states as well. Thus, although the states often have requirements peculiar to each, the policyholder who purchases his insurance in Massachusetts has a policy which will meet the requirements of, say, Texas, should he be involved in an accident in that state.

If state regulations of insurance is operating satisfactorily, as we contend, you might very well ask then why you are receiving complaints about policy cancellations, high premiums, or improper attention to claims. We do not suggest they be taken lightly. They are terribly important. As professional agents we have as great a concern as you for the welfare of these people. Most of them, after all, are our clients. But I submit that the criticism of our industry, considering its tremendous exposure to an enormous number of consumers, may very well be moderate. May I suggest that criticism aimed at drug companies, automobile manufacturers, the railroads, the Post Office—these too have been subject to heavy criticism, especially in recent years.

Mr. Chairman, I am not trying to be facetious, nor do I mean to be unkind to other industries, but it is a simple fact that in the past 25 years this nation has gone through an unprecedented transition, brought on by an explosion of the economy and the population. For our industry to have performed perfectly and to have avoided criticism during such a period would have been miraculous indeed. Can anyone truly say that the insurance industry would have been less criticized had it been under federal regulation since 1945?

There are further aspects of this question of state versus federal regulation. Takeover by the Federal Government of regulation of the automobile insurance business can only be followed ultimately by the redirection of state insurance premium tax revenue to Washington. How long will the very philosophy that suggests federal involvement in the automobile insurance business be satisfied not to tap premium taxes and fees now collected by the states?

In 1968, the states collected over a billion dollars in premium taxes. A report prepared by the Insurance Industry Committee of the State of Ohio for that year is hereto attached and made part of this statement as Exhibit "D," with the permission of the Chairman. It shows in simple figures what premium taxes mean to each state, especially in these days of grave financial problems for them.

Finally, should the Federal Government become involved in what is now handled by the state insurance departments, it will mean the usual regional offices, a panoply of federal civil servants, with all the cost and expense that go with them. To establish almost overnight a federal system of regulation and control

which has been developed in each state over many years would not only prove costly—it would undoubtedly lack the understanding of local conditions so vital in an industry such as ours.

MOTOR VEHICLE GROUP INSURANCE ACT—S. 946

And now, Mr. Chairman, I would like to address myself to S. 946, a bill which would permit the marketing of "group" automobile insurance by removing existing state laws, regulations and other similar restrictions which may prohibit such practices.

I want to say emphatically that the National Association of Mutual Insurance Agents is *not* opposed to the group marketing of automobile insurance per se. We cannot, and we do not, oppose *any* marketing system of insurance, so long as it is legal, ethical and above all, in the best interests of the insurance-buying public. As professional insurance agents, we recognize such marketing techniques as viable and modern with potentially great benefits for the public.

But, what we do oppose is any so-called "group" marketing scheme which would mislead the public into believing that such plans would automatically guarantee them automobile coverage at lower costs; and that eventually, all employers would offer automobile insurance as a standard "fringe" benefit of their employment. In our opinion, based on those "group" automobile insurance plans operating thus far and with which we are familiar, such benefits do not exist.

As to the possibility that most employers of the future will be offering such plans to their employees, again we do not agree. Once an employer or "group sponsor" has established such a program for his employees, he is faced with several problems—both real and potential:

(1) There is no evidence that the same undesirable risk (from an underwriting point of view) who is dropped from coverage in the "ordinary channels of insurance marketing on an individual basis" (S. 946, page 2, lines 12 and 13) will not also be dropped from a so-called "group" automobile insurance program. The "cream skimming" that exists today in the normal market will exist in the "group" market as well, unless specific measures are adopted to prevent it. Many of the consumer complaints you have received have been generated by cancellation, non-renewal or refusal of auto insurance by insurance companies. We feel that without careful regulation, "group" marketing programs will compound the so-called "residual" market problem rather than alleviate it. Thus, the already nagging problem of selectivity will be merely shifted from individual policies in the normal market to the "group" policies of the employer-sponsored plan. I would ask these employers: Do you really want to invite still another potential employee-relations problem in a field generally unfamiliar to you? I think not.

(2) If an employer decides to provide a "group" automobile insurance plan for his employees, he will immediately assume the heavy burden of being responsible to the employees for the plan's operation, even though an insuring company is actually writing the program. Proper coverage to meet specific needs of the "group" will have to be provided; many employees will prefer the payroll deduction methods of paying premiums, but many others will not; claims handling and the resulting settlements will greatly affect the employee-employer relationship, especially of course if the insured employee is unhappy with the results. In other words, at least in the eyes of the employee, the employer will assume all of the duties and responsibilities that go with being the insurance company. We would ask: Are most employers really in a position to assume such a role? I doubt it. Furthermore, Mr. Chairman, in this day of vast conglomerates would we not be returning to the repugnant "company store" method of merchandising? In other words, it is not unreasonable to assume that a subsidiary of a conglomerate would place its "group" automobile insurance plan with an insurance company also owned by the conglomerate. I ask you, how much leverage would an employee have for suing a disputed claim against an insurance company which is in effect owned by his own employer?

(3) When employer-sponsored "group" automobile insurance is established, what will be the feelings of those employees who either do not wish such coverage through the "group" plan or who do not qualify because they do not own or operate an automobile? Most, if not all, present benefits affect *all* employees. But would not providing automobile insurance (even if it is neither a payroll deduction plan nor paid for by the employer) lead to discrimination charges against the employer by non-automobile-owning employees? I believe so.

U.C. BERKELEY LIBRARY

(4) It is often suggested that premiums for the "group" automobile coverage be deducted from the employee's earnings. While at first glance this seems a rather simple method of handling premium payments, in fact it can lead to problems when the employee's paycheck is thereby further reduced. In addition, if the employer does not offer a payroll deduction system, what is available for those employees who now enjoy the convenience of financing their premiums? Will this method of paying be offered, and if so, by whom?

(5) It is a well known fact that automobile insurance rates have increased steadily for many years. If this trend continues, the employee's take-home pay (assuming it is payroll-deducted) will decrease correspondingly. This situation could cause employee resentment directed erroneously at the employer who in many cases is already withholding up to 20 percent of the employee's gross salary for other "fringe" benefits. As this pattern continues, there will be renewed pressure on the employer to assume part or all of the premium. Are most employers prepared for this eventuality?

(6) Still another area of concern to the employer considering a "group" automobile insurance program is the procedure to be established in soliciting and servicing the insurance. Most proponents of these schemes point to a reduction in cost to the insured because they eliminate the agent or broker. But who is going to promote the coverage available under the program, and more importantly, who is going to service it? It seems highly unlikely that a "group" insurance employee is going to demand any less personalized service. If the employer provides it, this is an additional cost to him which he either must absorb or pass along in some way to the employee. Furthermore, there is a good chance that the basic services of the advice on coverage and assistance in handling claims would be furnished by another employee who might not have the professional expertise or technical knowledge required. On the other hand, if the insurance company provides this service, the cost would be reflected in the rates charged, just as it is now under individual policies in the regular market.

(7) Once a "group" automobile insurance plan is initiated, it is very doubtful that it can easily be terminated. If, for any or all of the reasons cited above, the employer (or for that matter the employees) becomes disenchanted with the program, what can be done about it? A change in insurance companies or a discontinuance of the "benefit" altogether can lead to much difficulty and displeasure on the part of all concerned.

Mr. Chairman, the problems I have cited and the questions they raise are not intended to be totally negative about the possible adoption of "group" automobile insurance plans which S. 946 would undoubtedly bring about. Many of these problems can be solved, and indeed some probably already have been. But I do believe that they should be considered seriously by anyone who is advocating, promoting or considering using "group" marketing of automobile insurance.

While I have dwelled mainly on the employer-employee relationship, I would point out a general flaw which exists in most, if not all, present "group" marketing plans. Most programs do not provide for allocation of expenses incurred by the program to the "group" itself. As a result, these expenses are charged to all of the insuring company's accounts. Thus, the individual policyholder of that company who does not belong to the "group"—either because of personal choice or because he does not qualify—actually subsidizes the "groups" policyholders. This practice, in our opinion, is grossly unfair and highly discriminatory. For example, most "group" plans now in existence provide "stop-loss" limits. If a loss exceeds these limits, it is not charged to the "group" and thus the cost falls on the company's other policyholders who are not eligible for the "group". Professor Bernard L. Webb, CPCU, who is a strong advocate of "group" merchandising, who has written perhaps the most authoritative book on the subject, entitled *Mass Merchandising of Automobile Insurance*, and who I believe served as a consultant to the Senate Antitrust Subcommittee in their earlier deliberations on this subject, refers to these "stop-loss" provisions in the "group" plans of the Michigan Credit Union League, the Farm Bureau Companies and others. He concludes on page 48 of his book, "Group merchandising is not practical unless a substantial pattern of premium is paid by the employer." Professor Webb then goes on to say, on page 59, "The inequitable allocation of expenses between collective programs and individual policyholders is a distinct possibility. Some insurers may be tempted to use this method of maintaining a low price structure in order to obtain large blocs of premiums. There would be little chance of detection of such improper expense allocation at the present time."

For several years now, the National Association of Mutual Insurance Agents has sponsored and supported legislation at the State level which would in effect

permit "group" marketing of automobile insurance. We have tried to emphasize that stringent safeguards were needed to prevent the insuring public from being duped into accepting a program which would ultimately prove detrimental to their insurance needs. Admittedly, we have enjoyed only a very limited success so far. But the point is, in those states which have enacted such laws, the insuring public is relatively well protected because our safeguards were provided for in the approved legislation.

Louisiana, about a year ago, enacted legislation that embodied our suggested safeguards virtually intact; and a similar law was placed on the books a little earlier in New Hampshire.

But perhaps the most revealing example I can give, Mr. Chairman, is the drama that took place just last year in New York State. After what many of those close to the scene labeled "a classic" example of the democratic legislative process in action, the New York legislature approved a measure that would allow for the "group" marketing of automobile insurance. And, due to the untiring efforts of our affiliated state association, the legislation included our recommended safeguards almost in their entirety. Unfortunately, however, those who apparently would establish such insurance marketing programs without the slightest concern about what the plan's ultimate effect might be on the individual participants, convinced Governor Rockefeller that the legislation was undesirable. The Governor exercised his veto power at the very last moment, and the legislation was killed.

To say that we were dejected would be an understatement. But then, an unusual thing occurred: *Insurance Superintendent Richard Stewart promulgated department regulations setting forth rather stringent standards for "group" merchandising of insurance in New York, and they included most of the safeguards we had advocated in the vetoed legislation!* Today, in New York State, we are confident that "group" plan participants enjoy the same type of protection that we are advocating here today.

Accordingly, Mr. Chairman, I offer the following *basic* "guidelines" which our Association believes must be followed in any "group" marketing plan for automobile insurance if the insuring public is to be protected adequately:

(1) Mandatory participation in the plan should not be required as a condition of employment or membership, nor should there be any penalty whatsoever for non-participation in the plan.

(2) The "group" should consist of a fair percentage—taking into account eligibility percentages common in present "true group" Accident and Health plans—of eligible participants, both initially and as long as the plan is in effect.

(3) Individual policies or certificates should be issued to all plan insureds whereby the premiums on such policies are paid to the insurer (or its agent), with or without payroll deduction.

(4) Insurance should not be issued to any "group" formed principally for the purpose of obtaining such insurance, or to persons who are not bona fide employees of the "group sponsor," except that the plan may provide personal property or liability insurance for the plan insured's immediate family.

(5) Every policy or certificate issued under the plan should contain a provision that upon termination of the plan insured's employment (or membership), such insured should have the right to convert his policy or certificate, for one year from the date of such termination, to an individual standard policy of insurance which provides him the same limits and type of coverage, and at individual policy rates already approved by the state insurance authority.

(6) The "group" policy or certificate of an insured should not be cancelled for any reason except for non-payment of premium during the policy term or the suspension or revocation of the driver's license or motor vehicle registration of either the insured or any other operator residing in the household of the insured who customarily operates the insured automobile.

(7) The insurance policy or certificate should be the same for each "group" insured, varying only as to the amounts of insurance and limits of liability in accordance with the particular state's statute.

(8) All persons eligible for the "group" insurance plan should be accepted by the insurer for the type or types of coverage offered by the plan.

(9) Automobile liability insurance provided to the "group" plan insureds should be excluded from the base used in determining assignments the insurer is to receive under the particular state's automobile assigned risks plan, provided that the rates of the "group" plan do not operate in such a manner as to eliminate or discourage an insured from insurance under the "group" plan.

(10) In order to qualify to write a "group" plan, an insurer (or its principal affiliate) should also be engaged in writing coverage offered for insureds other than "group."

(11) An insurer should not use underwriting standards for individual risk selection (this includes, but is not limited to, standards used in connection with any merit rating plan used in the "group" plan) in "group" plans which are more restrictive or less equitable than the standards used by that insurer, or its principal affiliate, in the sale of the same kind of insurance outside the "group" plan.

(12) Every insurer writing a "group" plan should keep and maintain separate experience data for such plan, including complete records of income, losses and expenses so that the actual experience of each "group" may be fairly and readily ascertained; in addition, under no circumstances should the insurer be permitted to include the "group" experience in the experience of the individual insurance written outside the "group" plan.

(13) Experience rating should not be applied to a "group" until after a specified and reasonable period of operation and should then be based on that specified preceding period; thereafter, such experience rating should be made annually.

(14) Any "group" insured who believes in good faith that his plan is not being operated in such a manner as to meet any of these requirements should have proper recourse to lodge an official complaint before the state's insurance authority.

Mr. Chairman, our Association believes that unless proper regulation is forthcoming through implementation of specific guidelines such as we have offered here today, so-called "group" marketing of automobile insurance will be allowed to run rampant to the ultimate detriment of many policyholders. We do not suggest, however, that if these guidelines are followed rigidly, many of the problems I raised earlier will be solved.

It should be pointed out, of course, that several of the principles I have outlined above are in direct conflict with parts of Section 3 of S. 946. We sincerely believe, however, that unless some reasonable and, in our opinion necessary, safeguards are applied to these new marketing plans, the resulting abuses could create even more problems for the insuring public than the concept is intended to eliminate.

#### MOTOR VEHICLE INFORMATION AND COST SAVINGS ACT—S. 976

This legislation and similar measures can best be described perhaps as *long overdue*, Mr. Chairman. It is reported that the cost of motor vehicle damage is up some 28 percent in the past two and one-half years and is rising nearly twice as fast as the cost of injuries. It seems indisputable, therefore, that the design and production of safe motor vehicles having greater resistance to damage is a must if we are even to begin reducing the horrible carnage and property losses on our nation's highways and to begin lowering automobile insurance rates which are so closely tied to highway and automobile safety.

Earlier, I referred to specific proposals we have made to promote highway safety, principally aimed at the motor vehicle *driver*. In our proposed program, we purposely omitted references to the equally important problem of the *motor vehicle* itself. Our action was predicated on the belief that the Department of Transportation would issue meaningful regulations attacking the serious shortcomings in the automobile which in turn lead to the soaring costs of automobile insurance.

Since then, however, the Department of Transportation has issued bumper safety standards for motor vehicles. They are a beginning, but just barely. To be more frank, they are in fact inadequate and in our opinion will not help us make significant progress toward reducing automobile repair bills and lowering automobile insurance costs. We are disappointed in the DOT standards, to say the least.

Accordingly, Mr. Chairman, we see no alternative but to support legislation such as this which will in effect provide DOT a mandate to issue standards providing for improved motor vehicle design and production. In addition, of course, it will give the motoring public access to readily available information regarding the comparative safety and susceptibility to damage of the various motor vehicles.

Perhaps the key to this measure, at least as far as the insurance aspect is concerned, is the provision requiring that such information be provided to insurers for use in determining premium rates. Several insurers have already announced significant premium reductions for motor vehicles equipped with bumpers capable of withstanding low-speed crashes. We are confident that all of

our companies will ultimately make similar moves if such features become a normal part of all motor vehicles. Then, and only then, Mr. Chairman, can we expect a meaningful reduction in personal injuries and deaths resulting from auto crashes, and a comparable reduction in automobile insurance costs.

I pledge the full support and cooperation of our Association toward enactment of such legislation by the Congress. In the meantime, until more meaningful regulations are forthcoming from the Department of Transportation, we will continue to press for stringent motor vehicle design and production standards at the state level.

#### CONCLUSION

In conclusion, Mr. Chairman, I repeat that almost everyone agrees that improvement in automobile insurance is needed. Agents, insurance companies, state regulators, state and federal legislators—none are completely satisfied with automobile insurance as we know it today. But above all, the American motoring public is not completely satisfied. And after all, that is whom automobile insurance is designed to serve.

Until concerted action is taken by all of us, the public will not be properly served. *Now* is the time to get off dead center and start moving forward. We respectfully urge you therefore to give every possible consideration to the approaches we have proposed to you today.

Thank you, Mr. Chairman, for allowing us to share with you our thoughts and suggestions on the very important legislation now before you.

#### EXHIBIT "A"

##### THE ROLE OF THE INDEPENDENT AGENT IN THE MARKETING OF AUTOMOBILE INSURANCE

Reliable estimates indicate that there are more than 150,000 local independent insurance agents in the United States—one of the nation's largest groups of small businessmen. They are in a unique position to understand and serve the problems of their clients and their communities. Each represents a number of insurance companies, often both stock and mutual, which gives them the freedom to "tailor make" an insurance program based on the actual needs presented. Because they are not the employees of any particular company, they are in a position to arbitrate claims and adjustments to the advantage of their clients.

The evidence is irrefutable that people want professional service in the insurance field, and are willing to pay for it. A 1966 study conducted by Opinion Research Corporation for the Insurance Information Institute presented findings of a study among 2,003 men and women, 18 years of age and over, living in private households in the continental United States. One of the questions asked was, "If you were desirous of securing liability or collision insurance on a car, what would you consider the most important thing to look for?" The answers were interesting: only 38 percent said "price," the cost of the insurance. But the vast majority named those functions directly related to the independent agent: (a) selection of a good company; (b) comprehensive coverage; (c) prompt claim settlement; (d) protection from cancellation; and (e) the reputation of the agent himself.

However, the role of the independent agent in the marketing process of insurance is frequently misunderstood or unknown. Here then are just some of the important functions he performs. He:

*Presents the Need for Coverage.* The independent agent interprets the clients' needs and determines the proper coverage to fit these needs.

*Explains the Coverage.* Few people understand insurance. The independent agent constantly educates his clients and the public about the need for insurance and the terms, conditions, and coverages of the policies he is providing. The education of his client can well be an important responsibility of the agent.

*Risk Management.* While this concept more often applies to larger business and commercial property risks, it has a real applicability to automobile insurance. Risk management involves identification of the hazards faced, evaluating them in terms of those to be insured and those to be assumed by the client, and reviewing the hazards for the purpose of reducing or eliminating their potential to ultimately cause loss. Every time the independent agent discusses coverages with the insured, he is practicing risk management. This applies when he is insuring an automobile and selecting the proper coverages for the circumstances. (For example, recommending that collision coverage be discontinued when the

value of the auto has reduced sufficiently for the insured to assume the relatively small remaining risk.)

**Market Selection.** Having determined the insurance requirements of the client, the independent agent selects the appropriate coverage from the several companies he represents. The independent agent, being subservient to no one, is free to place the insurance needed by the client in a variety of companies. Thus, he can purchase just the right coverage for the circumstances his client has presented.

**Preparation of Policies and Endorsements.** The independent agent generally prepares the policy that he sells, or checks the accuracy of the policies prepared by the company. To do this he must employ policy raters—knowledgeable persons who can underwrite, classify and rate the risks presented to them. Also, every change made during the policy period must be processed. People move, buy new vehicles, revise coverage, add coverage for youngsters coming of driving age. All of these, processed by endorsements to the original contract, must be rated, prepared and delivered to the client.

**Reviewing and Updating Coverage.** The independent agent keeps his client's coverage current and up-to-date. He increases coverage to protect higher values, improves the limits of liability to better protect against loss, recommends the addition of new and pertinent coverages as they become available, and adjusts the policies and the coverages to reflect the changing needs of the client. Thus, the agent is responsive to the policyholder's particular needs.

**Advice and Counsel at the Time of Loss.** An agent's assistance is most important at the time of loss. The policyholder is often confused and needs help and guidance. The agent fills out the required loss and police reports, arranges for repair of the client's vehicle, advises the client as to what he should do in preparing his claim, calls the other party to get information not obtained by the client, and performs numerous additional services to assist his client through this trying experience. Moreover, claims of up to \$500 are sometimes processed by the agent himself. Finally, the independent agent helps his client to receive a fair and equitable settlement.

## EXHIBIT "B"

### MOTORISTS' INSURANCE—PROTECTION PLAN

A comprehensive package of legislative proposals designed to be enacted by the states, aimed at providing speedy, automatic basic injury compensation for all auto accident victims, and providing for the greatest possible protection for the nation's motorists by implementing stringent driver and highway safety measures and improving the legal system.

#### SYNOPSIS

##### I.—Highway Safety

This section calls for more stringent laws aimed at promoting highway safety. These include: loss of license and fines for driving under the influence of alcohol or drugs; permanent loss of license for habitual offenders; severe penalties for pedestrians involved in auto accidents while under the influence of alcohol or drugs; uniform driver licensing standards, including periodic physical and mental exams and testing of drivers; mandatory use of safety belts and motorcycle helmets, with penalties for nonuse and nonrecovery for injuries incurred as a result of nonuse; establishment of an effective system to identify habitual offenders; mandatory driver education; adequate police to patrol highways and apprehend violators; implied consent laws; and periodic vehicle inspection.

##### II.—The Legal System

This section calls for reforms of the legal system as it applies to auto insurance claims. These include: more judges and mandatory arbitration for all claims under \$3,000; 25% limitation on contingent fees with the right of appeal; all contingent fees approved in writing by the client and filed with the court; strict control of the division of attorneys' fees; itemized statement of fees submitted to court and client by attorney; modification of Collateral Source Rule to allow other benefits received to be admissible evidence, including remarriage; eliminate contributory negligence as an absolute bar to recovery and substitute

the Wisconsin Law; adoption of the Arkansas tortfeasor law; eliminate *Ad Damnum*; stiffer penalties for fraudulent claims and those who contribute to them; and adoption of various other practices and procedures to make the legal effort more efficient.

### III.—*The Reparations System*

This section provides for changes in the present system for compensating auto accident victims. Every auto liability policy shall include the following minimum benefits payable immediately regardless of fault: medical and hospital expenses coverage—\$2,000 aggregate limit and optionable deductible up to \$250; disability coverage—85% of gross income after 30 days, for 52 weeks, with a maximum of \$500 per month or \$6,000 total; uninsured motorist coverage—minimum \$10,000 per person and \$20,000 per accident; accidental death benefits—minimum \$5,000 if death results directly from the accident. Persons covered should include: named insured; members of the insured's family; guest passengers; and pedestrians. Coverage may exclude persons who contribute to their own injury or death through various unlawful means, and those entitled to Workmen's Compensation and similar statutory benefits. The insurer has the right of subrogation through mandatory inter-company arbitration. The insured has the right of rejection. The amount paid under uninsured motorist coverage may be reduced by the amount of benefits paid under other coverages. Insurers offering these automatic benefits may provide for subrogation and setoffs of amounts paid under such provisions against claims brought under the liability section of the policy. Broader coverages should be adopted as follows: up to 50% additional damages when medical and hospital expenses amount to \$500 or less; up to 100% additional damages when medical and hospital expenses exceed \$500; and higher standards allowed in cases of death and more serious injuries. Insurers should adopt immediate advance payment procedures, with credit allowed on subsequent recoveries by claimants and such payments not to be construed as an admission of liability. Loss of income damages recoverable should be defined so that juries can consider income tax savings when setting damage awards.

### IV.—*Rates and Policy Cancellations*

This section calls for enactment of competitive rating laws, and for the following restrictions on auto policy cancellations: cancellation only for nonpayment of premium or the suspension or revocation of the driver's license or motor vehicle registration; specific notice required of the insurer's intention to cancel or non-renew; and the reasons for cancellation provided to the insured upon request.

Adopted by the board of directors of the National Association of Mutual Insurance Agents, March 14, 1971.

## MOTORISTS' INSURANCE—PROTECTION PLAN

### I.—*Highway Safety*

1. Mandatory license revocation and severe fines for those convicted of operating a motor vehicle while under the influence of alcohol or narcotic drugs.

2. Permanent revocation of driving privileges of those motorists found guilty of habitual moving traffic law violations.

3. Severe penalties for pedestrians involved in motor vehicle accidents while under the influence of alcohol or drugs.

4. Uniform licensing standards for all drivers, coupled with a requirement for periodic physical and mental examinations and testing of drivers.

5. Mandatory use of motor vehicle safety equipment, including safety belts and motorcycle safety helmets, with penalties for nonuse and provisions calling for nonrecovery for injuries incurred which could have been prevented through use of such safety equipment.

6. Establishment of an improved system to identify those repeatedly involved in automobile accidents so that those found guilty of improper driving practices may be effectively dealt with.

7. Mandatory and meaningful driver education.

8. Establishment and maintenance of adequate police forces to patrol highways and apprehend violators.

9. Implied consent laws.

10. Periodic vehicle inspection.

## II.—*The Legal System*

### 1. Relieve court congestion and delay by :

(a) Providing a sufficient number of judges to keep abreast of the increase in judicial work occasioned by population, and (b) employing a mandatory small claims arbitration system for all lawsuits which involve claims under \$3,000.

### 2. Regulation of the contingent fee system by providing that :

(a) The amount of such a fee should be strictly regulated by appropriate local court rule or legislation (i.e. a 25% limitation on contingent fees, with the right of appeal to the court for approval of a larger fee); (b) every retainer on a contingent basis should be in writing in a fixed format and should be signed by the client; (c) a retainer statement should be filed with the appropriate judicial authority by a retained attorney within a fixed number of days from the date of the written contingent fee retainer; (d) there should be strict control of the division of fees between attorneys, based only upon work performed, and (e) upon completion of the claim or suit an attorney should file an itemized closing statement with the proper judicial authority and a copy thereof should be delivered to the client.

3. Modification of the Collateral Source Rule so that evidence of the nature and extent of all benefits and services received or to be received by the claimant as a result of the alleged injuries and damages sustained be admissible. Evidence of the remarriage of a surviving spouse should be likewise admissible in an action for wrongful death.

4. Eliminate contributory negligence as an absolute bar to recovery in an action for damages and provide instead that a claimant may recover if his negligence was not as great as the defendant's. The claimant's recovery should be reduced in accordance with the comparative degrees of fault by each party (Wisconsin SA 895.045). The following special verdict procedure should be established: Following a reasonable question and answer period, the jury should determine what percentages of total negligence was attributable to each party and the total amount of damages sustained by the plaintiff, thereby allowing the Court to reduce the total damages by those percentages (Wisconsin). Provide for contribution by joint tortfeasors to the plaintiff in proportion to the negligence attributable to each and provide certain safeguards and protections should any tortfeasor's contribution exceed his proportionate share or should one tortfeasor pursue a claim against another (Arkansas SA 34-1001 ff).

5. Eliminate *Ad Damnum*: That any pleading demanding relief in the form of unliquidated damages may only make a prayer for general relief and state that the amount claimed is within the minimum and maximum jurisdictional limits of the court.

6. Impose stiffer penalties upon those who intentionally make false or fraudulent claims for personal injury or property damage, upon those who intentionally assist in making of such claims and upon those who intentionally withhold information necessary to prompt, fair settlement of claims.

7. Provide for a more efficient use of the legal effort by adopting, in those jurisdictions which do not now have them or whose present rules are not as workable, those practices and procedures which limit the right to voluntary dismissals or nonsuits; the right to a split trial on issues of liability and damages; modification of appeal bond rules; summary judgment; mental and physical examinations of litigants; demands to admit the genuineness of documents or relevant facts; and offers of settlement, judgment and damages.

## III.—*The Reparations System*

1. Every automobile liability policy covering any non-fleet private passenger vehicle shall include the following minimum benefits payable immediately regardless of fault:

(a) Medical and hospital expense coverage up to a \$2,000 aggregate limit and subject to an option deductible (applicable only to the named insured and resident family members) of up to \$250; (b) disability coverage of 85% of gross income lost during a period commencing 30 days after the accident and continuing for 52 weeks, subject to a maximum of \$500 per month or a total of \$6,000; (c) uninsured motorist coverage of at least \$10,000 per person and \$20,000 per accident, and (4) accidental death benefits of at least \$5,000 when the death occurs as a direct result of the accident.

2. Persons covered should include the named insured, members of the insured's family residing in the same household, guest passengers and pedestrians. The

coverage may exclude persons who have injured themselves intentionally, were injured while intoxicated or under the influence of narcotic drugs, were operating the motor vehicle without a license or after suspension or revocation of license, were operating a motor vehicle in any race or speed contest, and were seeking to elude lawful apprehension or arrest by a law enforcement official; and any persons entitled to Workmen's Compensation and similar statutory benefits because of their injuries.

3. After the claimant has been paid his automatic benefits, his insurer should seek reimbursement from the party at fault (if any) or his insurance company. The issue of liability and reimbursement as between admitted insurance companies should be decided by mandatory inter-company arbitration, thereby reducing expenses and the burden on the courts.

4. The named insured should have the right to reject the automatic coverages (outlined in III, 1) as they apply to himself and members of his family residing in his household.

5. The amount an insurer is obligated to pay any insured under the uninsured motorist coverage may be reduced by the amounts of benefits paid to the same insured or his personal representatives under the medical and hospital benefits, the income disability benefits and the accidental death benefits.

6. Insurers affording the automatic benefits (III, 1) may provide for subrogation and for setoffs of amounts paid under such provisions against claims brought under the liability section of the policy.

7. Insurers should be permitted—in fact, encouraged—to offer broader coverages than the minimum benefits outlined herein.

8. The following standard for determining damages for pain, suffering and inconvenience should be adopted for all motor vehicle accident cases:

(a) Up to 50% additional damages when medical and hospital expenses amount to \$500 or less; (b) up to 100% additional damages when medical and hospital expenses exceed \$500 and (c) In cases of death, permanent disfigurement, loss of limb, permanent loss of a bodily function and other exceptional circumstances, a court or jury may exceed these standards.

9. Insurers should adopt procedures to provide immediate advance payment in every meritorious case of all out-of-pocket expenses of the claimant as they accrue and provide immediate settlement of property damage liability claims separately from bodily injury liability claims arising out of the same accident, where final settlement of the latter is delayed pending medical treatment or other causes beyond the insurance company's control. Insurers making advance payments and settlements should be allowed to take a credit against any subsequent judgment recovered by the claimant or settlement made with him. Such payments and settlements should not be construed as an admission of liability in any subsequent judicial proceedings.

10. Damages recoverable for loss of income in liability cases should be defined so that juries can take income tax savings into account when they are called upon to set damage awards.

#### *IV.—Rates and Policy Cancellations*

1. Competitive rating laws should be enacted to assure the public of the lowest possible price, best service, latest innovations in product and an available market. Rates would be effective when put into use, but they should be submitted to the state insurance commissioner for his information. In addition, the commissioner should approve reasonable rules and statistical plans adapted to each of the rating systems used and therefore used by insurers in recording and reporting loss and expense experience.

2. The following restrictions on the right of insurance companies to cancel automobile liability policies and combination policies affording liability and physical damage insurance covering private passenger automobiles owned by individuals or families should be adopted:

(a) After a reasonable underwriting period, the policy may be cancelled by the company during its term only for nonpayment of premium or the suspension or revocation of the driver's license or motor vehicle registration of either the named insured or any other operator residing in the household of the named insured or who customarily operates the automobile; (b) specific notice requirements should be established with respect to the insurer's intention to cancel or non-renew the policy, and (c) the reasons for policy cancellation should be provided to the insured upon request.

## EXHIBIT "C"

[Article from Mutual Review, February 1971]

## THE FEDERAL REGULATORS: OLD LIBERALISM VS. NEW CONSERVATISM

(By Louis M. Kohlmeier, Jr.)

There are many currents and counter-currents running in the country nowadays on issues such as consumerism, student unrest, law-and-order, and the rights of minorities. Political party labels are not always useful in detecting how the currents are running on particular issues. A conservative Republican may very well be in favor of new federal action to curb local crime and may be opposed to federal programs to regulate business. A liberal Democrat may be against deep federal involvement in the crime problem and for regulation of business.

But, even taking the seeming contradictions and complications into consideration, it seems to me that four main currents of public and political opinion can be identified. I would term them an old and a new liberalism and an old and new conservatism.

The old liberalism is a heritage from the days of the New Deal and certainly it represented the political mainstream through most of the post-World War II years. The old liberals have been in Washington for years and they still embrace New Deal-type solutions to contemporary problems, feeling the problems can be solved with federal power and federal money. The old liberals are found mainly in the Senate, but there are some in the House.

The old conservatives tend to deny that problems exist. But when they are pressed they tend to go along with New Deal-type solutions, perhaps because they also have been in Washington for a long time and are of the same generation as the old liberals. They also are to be found mainly in the Senate.

The new liberals see all the problems others see and, in addition, are constantly busy observing problems heretofore unseen. They, like the old liberals, insist that the federal government alone can solve the nation's problems. But, unlike the old liberals, they have no faith in the old New Deal-type of solutions and, rejecting these, they seem hard put to offer federal solutions of their own. There are some new liberals in the House, but they are found mainly in universities and working for foundations.

## NEW CONSERVATISM

Lastly, the new conservatives also see the problems of contemporary America, though not in as great an abundance as the new liberals. They reject not only New Deal-type solutions, but they also doubt that the federal government alone can solve the problems. There are numbers of this breed in the executive branch of government and some in the House. But they too are found in universities and foundations.

If these distinctions among four political attitudes are valid, then it seems to me that the elections last fall were unusually significant. My conclusion is that the mainstream of political sentiment in this country is moving away from the old liberalism that dominated much of the postwar period and is moving toward a new conservatism.

I draw this conclusion in part from the defeats of Senators Tydings and Goodell, and of Senator Gore of Tennessee. All three certainly were liberals and I would call them practitioners of the old liberalism, although I agree the label is debatable as it applies to Senator Goodell. All three of those races were of national significance because the Nixon Administration made them so, and I would classify President Nixon as a new conservative.

But I do not conclude that the country is moving toward a new conservatism only because of those three Senate races. It is perhaps even more significant that many normally liberal candidates moved to the right during the campaign, particularly on the law-and-order issue, in the hope of winning on election day.

I am sure I don't know whether the President is correct in claiming that he now has an ideological majority in the Senate.

But it seems plain that the new Congress as a whole will be more conservative than it has been in some years. The executive branch already is in conservative hands. And I think it is accurate to say that the third branch, the Supreme Court, is being moved by that strange process of judicial and political osmosis away from liberalism and toward conservatism.

## FEDERAL REGULATION

How then will the larger political context affect the specific issues involved in federal regulation of private industry, present and future?

Any answer to that question must begin with the observation that the federal regulatory apparatus, as it has been constructed over nearly a century and now exists, is today defended by almost no one except the old liberals who, not incidentally; helped to build the essentially New Deal structure of the independent regulatory agencies.

Criticism of the agencies isn't new. But I believe it never before has been as loud and it never before has been directed at the fundamental question of the ineffectiveness of these agencies as tools of federal law enforcement.

The criticism is coming from the new conservatives and the new liberals, and consequently it sometimes makes strange bedfellows.

On the conservative side, the American Bar Association has told President Nixon that the Federal Trade Commission should be abolished if it cannot be improved. Senators Tower of Texas and Baker of Tennessee, both Republicans, have asked Congress to study whether the Interstate Commerce Commission should be abolished. Senator Mansfield of Montana, the Democratic majority leader, already has decided the ICC should be abolished and has said so on the Senate floor.

Among the new liberals, Ralph Nader has been probably the most outspoken critic of the regulatory agencies.

It also is worth noting that the theorists of the movement known as the New Left, in their criticisms of a whole range of American institutions, public and private, often have singled out the federal regulatory agencies. For instance, one of these theorists is Charles Reich, the Yale professor who recently published a new book titled *The Greening of America*. The book, which is gaining great popularity among young people, singles out the regulatory agencies as prime examples of what's wrong with America.

I am not sure I would go as far as Professor Reich. But I of course share the view that federal regulation has not served the interests of consumers and, beyond that, it is my belief that regulation demonstrably also has not served the interests of industry or government.

## REGULATORY FAILURES

I could catalog the criticisms, but some of the failings of the agencies are obvious. The Federal Power Commission, for example, for many years has been regulating the production and transportation of natural gas and now some of the nation's largest cities apparently face a shortage of gas for winter heating.

The Federal Communications Commission nearly 20 years ago adopted a national master plan for television broadcasting which has never been fulfilled in terms of its projection of operating TV stations.

The Atomic Energy Commission has fallen far short of the goals Congress envisioned for peaceful uses of atomic energy.

The list of regulatory failures is a long one.

Some of the critics of regulation say the agencies have failed principally because the regulators are dull individuals who are captives of the industries they regulate.

That is part of the truth, but the whole truth is far more complex.

At the risk of oversimplification, it seems to me that the failures of federal regulation stem from three basic considerations.

The first is that, while federal regulation always begins modestly and usually is superimposed on state regulation, it never stops growing once begun. The basic reason is not simply bureaucratic empire building. The reason is that it is impossible to regulate or change one set of industrial practices without affecting others and thus others must be brought into the regulatory sphere. Further, it is impossible to regulate one group of competitors without affecting others, or indeed to regulate one industry without affecting related industries. It is for these basic reasons, I think, that federal regulation inevitably has become far more complex and difficult an undertaking than was envisioned by the New Dealers or, before them, the Populists.

The second consideration flows from the first. When Congress has decided to regulate an industry which hitherto was not regulated by the federal government, it has been prone to create a new independent agency rather than utilize an

existing agency. This congressional habit stems in part from a recognition that any bureaucracy tends over time to become static and unimaginative. But it also stems from the constitutional notion that federal power is less dangerous if divided than if concentrated.

And the third consideration is that each agency in time becomes the promoter as well as the regulator of its industry.

This result does not necessarily stem from the capture of the regulators by the regulated. It stems from the fact that federal regulation of industrial competition on a national scale, over the long haul, cannot forever pursue the consumer interest in low prices and economic security without also taking into account industry's need for an adequate return on investment and for new capital. If these needs are ignored for long, regulation cannot assure an adequate supply of goods and services in the future.

Applying these three sets of principles, what has been the result?

#### FEDERAL FIASCO

The result is many federal agencies (by some counts, more than 100 of them), each independent of the others and all effectively independent of the elected authority of the executive and legislative branches and thus free of meaningful coordination. Each of these agencies exercises an extraordinary power within its jurisdiction, writing rules with the force of law. With these rule-making powers and an array of other powers that aren't always uniform, the regulators proceed upon the delicate task of economic regulation.

To illustrate the difficulties, let me trace quickly the development of federal regulation of transportation, which has affected the insurance industry. I also single out transportation because this is the oldest area of federal regulation and its climax is the Penn-Central bankruptcy proceedings, which are the grandest fiasco yet wrought by the regulators.

This bit of history began in 1887 when Congress created the Interstate Commerce Commission for the single purpose of keeping railroad rates down. Subsequently a number of railroads went into bankruptcy and the government operated the railroads during World War I. Those experiences led Congress in 1920 to extend the ICC's regulatory authority to rail rate cuts and to mergers. Most of that package of controls was extended to the trucking industry in 1935 and to domestic water transportation in 1940.

Thus the ICC regulates competition among three kinds of carriers in domestic surface transportation, and attempts to allocate business among them.

That might not have been too difficult if the surface common carriers had a transportation monopoly. But Congress in 1938 created the Civil Aeronautics Board to regulate and promote air transportation, and gave the CAB but not the ICC subsidy authority.

In 1956, Congress entrusted to still another arm of government, the Bureau of Public Roads, the task of supervising state construction of the Federal Interstate Highway System.

The results are that the nation has a highly cyclical airline industry which defies the laws of supply and demand by raising seat prices every time it increases seat capacity. We have, to my way of thinking, a highway system so magnificent that it has encouraged the production and purchase of so many private automobiles and trucks that now our attention is drawn to the problems of highway accidents and air pollution. Moreover, the highways themselves are becoming a social issue.

We also have with us today the old ICC, which helplessly watched so much transportation business take to the highways and airways that it could figure out no better way to save the services of the bankrupt New Haven Railroad than to allow the Pennsylvania and New York Central Railroads to merge on condition that they take in the New Haven. And now the Penn-Central has gone down, even before it could pay for the New Haven properties.

#### WHAT WILL BE DONE?

Quite obviously then, all the criticism of federal regulation is warranted. But what, if anything, will be done?

The first indication of what will be done may well come very shortly when the Senate Commerce Committee decides what to do with Senator Hart's auto insurance bills. Senators Hart and Magnuson, the committee chairman, are old liberals and the Hart proposals essentially are cut out of old New Deal cloth.

The Nixon Administration apparently will counter with its own proposals to preserve state regulation of the auto insurance industry. So we will have a reasonably clear cut confrontation between the old liberalism in the Senate and the new conservatism in the White House.

If Mr. Nixon wins, he will indeed have evidence of an ideological majority in the Senate.

But it would be an easy victory compared with the task of dismantling the federal regulatory apparatus which has been created over nearly a century.

There are two realistic approaches to the dismantling process. One is for the federal government to return to the states some of its regulatory authority, and at the same time to share federal revenues with the states. The other is to place a greater reliance for consumer protection on industrial competition. Neither approach is easy, but some progress toward dismantling the existing federal apparatus seems likely in the years ahead. After all, it was President Kennedy, certainly a new liberal, who first proposed a partial dismantling of the Interstate Commerce Commission.

But it also is fair to predict that a century of history will not be totally reversed. Federal involvement in private industry is in some respects so deep that they may be no alternative to still deeper involvement. Nationalization of some railroad properties, for instance, may be the only way left to preserve essential rail services.

Beyond that, the federal government will not withdraw from its assumed role as overseer of the total national industrial economy. Not even Mr. Nixon has repudiated the federal responsibility for full employment without inflation. He argues with the new liberals over means, not ends.

## STATE INSURANCE DEPARTMENT STATISTICAL DATA, YEAR ENDING DEC. 31, 1969, COMPILED BY THE INSURANCE INDUSTRY COMMITTEE OF OHIO

States:	Companies	Premium volume all companies, 1969	Premium and franchise taxes certified, 1969	Fees collected, 1969	Total taxes and fees	Funds spent for operation of department	Personnel

Senator HART. We have just heard the point of view voiced by the National Association of Mutual Insurance Agents, and now we will hear from the National Association of Insurance Agents.

Speaking for them is the chairman of the casualty committee, Mr. Harold Eustis of Mississippi, and Donald Perin, director of research of the association, will accompany him.

I apologize to you for keeping you so long here.

**STATEMENT OF HAROLD EUSTIS, CHAIRMAN OF CASUALTY COMMITTEE, NATIONAL ASSOCIATION OF INSURANCE AGENTS, GREENVILLE, MISS.; ACCOMPANIED BY DONALD PERIN, DIRECTOR OF RESEARCH**

Mr. EUSTIS. Thank you, sir.

Mr. Chairman and members of the committee:

My name is Harold Eustis. I am an independent insurance agent from Greenville, Miss. I am privileged to appear here today as chairman of the casualty committee of the National Association of Insurance Agents. This organization has members in the 50 States and the District of Columbia and is the largest insurance producer organization in the United States.

With me is Donald Perin of New York, who is our director of research.

My comments are reflective of the independent agents' deep interest in and concern over the problems which have arisen in various sections of the country in the area of automobile accident reparations. We agents appreciate this opportunity to present to you our views about the proposed changes in the handling of these reparations.

I hope you won't think me presumptuous if I compliment your committee at the outset of my testimony for your interest and your straightforward approach to finding a workable solution to the very perplexing problem of properly compensating the automobile accident victim. Your desire to hear the views and comments of all interested parties on this major issue is commendable.

We agents believe we are uniquely qualified to testify on this issue because we are the ones in immediate personal contact with insurance buyers. Because of our daily contact with the insuring public we are the first ones to receive any complaints about the present system as related to price, claims, payments and availability.

We must agree that some remedial action is indeed warranted to correct the recognizable imperfections that have developed in our present system. We remain firmly convinced, however, that basically the fault concept best serves the public, although it does appear to have some shortcomings.

Our deep concern for improvements in the present automobile accident reparations system has taken the form of a careful study by the casualty committee of this national association. This committee's recommendations were unanimously adopted in January by our National Board of State Directors. This action provides an accurate public reading of the feelings and attitudes presently existent among agent leaders and memberships in each of our 50 State associations.

The position of the National Association of Insurance Agents, which we now find closely parallels the position taken by most other insur-

ance organizations, as well as members of the academic fraternity, the administration, and some Members of Congress, is as follows:

(1) That the National Association of Insurance Agents supports a system which provides for immediate first-party payments for economic loss due to bodily injuries caused by or resulting from automobile accidents.

(2) That the National Association of Insurance Agents reaffirms its position that the tort liability principle should be retained.

(3) That the National Association of Insurance Agents maintains the firm conviction that every effort should be made to correct the deficiencies of the present system, on a State-by-State basis, before the basic principles of the system are subjected to major modification.

(4) That the National Association of Insurance Agents recognizes the public need to develop some objective standards for measuring general damages.

It is apparent that these four basic recommendations are broad in scope, but they are purposely so in order to leave the ultimately and proper decisions of specific actions to individual States where variations in conditions will dictate varying solutions.

From these four basic points you will recognize that the many thousands of independent insurance agents comprising our association's membership—although they do recognize some imperfections in the present fault concept—firmly believe that such conditions do not call for a complete scrapping of the tort liability concept. Individual wrongdoers should continue to be held basically responsible for their negligence, even though some form of first-party reparations may now be in the public interest.

We are particularly interested in the fact that the reparations provisions in S. 945 retain the principle of tort liability and fit within the broad guidelines that our association has adopted.

It is our belief that the widespread general publicity and comments on studies of so-called no-fault insurance over the past several years may be misleading the public into believing that they would receive first-dollar reimbursement for automobile property damage, as well as bodily injury loss, without regard to fault.

There is also an apparent widespread belief that there would be an automatic reduction in the cost of insurance were such a no-fault system adopted. We believe this is a false, or at least speculative, assumption.

At a recent seminar on no-fault auto insurance sponsored by the University of Minnesota it was demonstrated that even a relatively modest change in bodily injury claim frequency could change a reduction in premium to an increase.

In simplified terms, the total cost of automobile accidents is the product of claim frequency times claim severity. Even the proponents of a complete no-fault system acknowledge that claim frequency will increase under such a system—but they don't know how much. They anticipate that the severity will go down enough to offset the effect of the increased frequency but neither the actuaries nor their supporters know for sure, and both admit that the cost estimates developed depend upon a host of assumptions.

In any discussion of the no-fault provisions of S. 945, and most other no-fault plans that have been advanced, we are dealing with

the bodily injury portion of the automobile insurance package, or an average of about 35 percent of the total premium under the present system. This means that even a 25-percent reduction in the bodily injury portion of the premium produces only an 8¾-percent reduction in the cost of the total automobile insurance package. There is that much differential and more in the present market between individual companies, and even within the same company on different policy forms.

We recognize that S. 976 deals with the problem of damagability of automobiles, but we also recognize that even the passage of such a bill would take some time to get within the insurance premiums.

One of the basic differences between what we propose and what is provided in S. 945 is the State versus Federal approach to solving the automobile accident reparations problems.

We believe that the problems in this area are significantly different from State to State, and sometimes even within a given State, particularly as they relate to the effectiveness of local law enforcement, one of the key factors in automobile accident control—and directly related to automobile insurance rates and availability.

As a part of the National Association of Insurance Agents' efforts to reduce automobile accidents we have embarked upon a major national consumer crusade to improve local law enforcement. This program is aimed at every major city manager, city or county council and every State legislature. It is important to note that no law or regulation—whether Federal or State—is any better than its administration at the local level.

Mr. Chairman, if I may, I would like to offer in the record a kit here which explains in detail this consumer information program.

Senator HART. It will be received.<sup>1</sup>

Mr. EUSTIS. Another reason we favor solving the automobile accident reparations problems on a State-by-State basis is the difference which exists, from State to State, in (1) medical cost levels, (2) average wages and (3) general economic conditions, all of which will have a direct effect upon the level of the thresholds of first-party, no-fault auto accident payments which should be spelled out in the statutes. Above such thresholds we agree that individuals should be allowed to make the choice of either depending upon the principle of tort liability or buying high level first-party coverage to protect themselves against catastrophic harm.

I would like to make one observation about litigation. While it is true that the law of negligence, under which many of our automobile accident cases are settled today, has produced much litigation, bringing with it court congestion and delay in some jurisdictions, a no-fault system will not remove litigation. As any agent can testify, there are plenty of lawsuits under first-party insurance policies, brought either under contract law to straighten out differences of opinion and interpretation of the policy provisions or under equity to determine the actual extent of loss.

Part of the Department of Transportation's automobile insurance and compensation study dealt with the matter of mass merchandising of property and liability insurance, and a companion bill to S. 945 deals with group selling. There appear to be some misconceptions about how the agents feel generally about the group selling of automobile insurance and homeowners. Most agents do not oppose mass

<sup>1</sup> See p. 553.

merchandising plans, per se, but they are concerned primarily about two aspects of such plans: First, the lessening of proper service to the policyholder; and, second, the hidden expense of administering such plans by the employer and by the insurance companies. Agents feel that the public will be shortchanged by mass merchandising plans unless such expenses are carefully segregated and identified.

In the areas of both no-fault auto accident reparations under a Federal program, and mass merchandising plans written on a wide-open, unrestrained basis, the agents fear similar consequences. If they don't work, the problems produced could be horrendous—particularly as they relate to coverage and price—and both situations could be very difficult to reverse.

Mr. Chairman, we respectfully request careful consideration of our viewpoint by the committee and express our appreciation for this opportunity. We will gladly endeavor to answer any questions you or the other members may have.

Senator HART. Thank you.

Mr. Perin, do you have any comments?

Mr. PERIN. No, sir; I have no separate statement.

Senator HART. I noticed where you make the point that S. 945 deals with bodily injury, and you make the computation allowing even for a 25-percent reduction in the total automobile insurance package cost that it would produce only an 8¾-percent reduction in cost.

But putting that another way, we are talking about a billion and a quarter dollars. Assuming that the information we have is correct, that the total automobile insurance package of premiums runs about \$14 billion a year, 8¾ would be about \$1¼ billion. That is a pretty substantial saving.

Mr. EUSTIS. Overall, it is. We are not opposed to cost saving to the individual buyer. It doesn't look like all that much, though. That is the point I wanted to make.

Senator HART. Senator Cook?

Senator COOK. Thank you.

Mr. Eustis, I think the only point that you bring out is the same point that Mr. McGowen brings out, that to provide a means by which basic protection is immediately available and that if that protection is not elected by the insured, that he can work it basically on the same basis as we work workmen's compensation.

Do you agree with this type of theory?

Mr. EUSTIS. We don't have a specific plan. We have some broad guidelines.

Senator COOK. Aren't we talking about much the same thing under your guidelines 1, 2, 3, and 4?

You say, "the National Association of Insurance Agents reaffirms its position that the tort liability principle should be retained."

Aren't we talking about a combination of both?

Mr. EUSTIS. That is correct.

Senator COOK. Is it your opinion that by working on a combination of both a savings will ultimately be perfected because the biggest majority of your cases will be settled under the no-fault provision, and adequate protection is provided to the insured who wishes to take his case on a tort liability basis?

Mr. EUSTIS. Senator, I wouldn't want to make any speculation about any exact amount of cost saving. What you are going to do under this

sort of plan is to pay people who have never been paid before. You have got to get the money from some place. You can get it out of circumscribing the general damage requirement or eliminating general damage recovery and hopefully reducing litigation expense and legal fees, and get that portion out of the premium.

Senator Cook. I hope you don't mean people who have never been paid before. If you are saying this, then you are saying a tremendous amount of people who have insurance coverage have never been paid when legally or logically they should have been paid.

Mr. EUSTIS. I am saying, Senator, that under your present tort system a person who doesn't have first-party coverage in a State that has a contributory negligence statute, then under the tort system he would not recover and it would not be paid under auto bodily injury system.

Senator Cook. We don't have too many States with contributory negligence, do we?

Mr. EUSTIS. We have a comparatively broad contribution negligence statute in my State. Most everybody that gets hurt down there gets paid.

Senator Cook. I think we are coming close to what I envision, because I think we face the situation where as long as we retrain the ability to pursue tort liability and then have an overall no-fault, we may find that it will be totally destructive to some people who sue above a no-fault facility and conceivably many people in the country may feel that they can totally rely on a no-fault program and then find themselves wiped out because the no-fault has been utilized by a plaintiff and then all of a sudden he finds himself sued and liable for tremendous judgment.

So, I think what we are talking about is a combination of both. I think that is what you are talking about.

Mr. EUSTIS. Yes, sir.

Senator Cook. Thank you, Mr. Chairman.

Senator HART. Mr. Sutcliffe?

Mr. SUTCLIFFE. Mr. Eustis, I understand that these positions that you have set forth are general positions and you do not have a plan by which to test the specifics of the provisions.

Mr. EUSTIS. That is correct. We did that purposely.

Mr. SUTCLIFFE. I would like, however, to ask you several questions about whether or not you feel the principles would suggest one course of action or another, because on the basis of the principles it is difficult to tell.

Would you abrogate the tort action between policyholder to the extent thier economic losses are compensated on a first-party basis?

Mr. EUSTIS. These are very broad things, if you want a personal opinion of mine or the position as adopted by the National Association. We purposely left these broad to allow experimentation within the individual States. Had we come out with a so-called guide plan, we feel we would have discouraged that experimentation. These are very broad and they do not and never were intended to go into specifics such as you bring up.

Mr. SUTCLIFFE. I understand that position and, therefore, will not go into any other specific questions about the propositions. I understand there is flexibility to approach the matter in the best way that a particular jurisdiction, be it State or national, sees fit.

Mr. EUSTIS. Generally speaking, any plan which does not com-

pletely abrogate the tort system would come within these guidelines provided it is done on a State-by-State basis.

Mr. SUTCLIFFE. Senator Hart has mentioned potential cost savings of \$11¼ billion if you improve the efficiency of the bodily injury liability system by 25 percent. On the basis of testimony with regard to the Puerto Rican plan, that does not seem to be an overall generous figure at all.

Would you or your organization support efforts to include property damage liability within the ambit of first-party coverages to effect a similar savings that could be passed on to those people presently not receiving benefits in the combination system?

Mr. EUSTIS. Not at this time, Mr. Sutcliffe, the reason being, No. 1, we think we ought to try the bodily injury portion first. You are dealing with a smaller claim frequency. There are many, many cases where there is no question about who is at fault, and people can get awfully upset about a \$50 skinned fender. We do not believe at this time it is proper to go that far.

Mr. SUTCLIFFE. Would you be in support of a proposal to approach the property damage problem from another angle; namely, the angle of requiring manufacturers to build cars whose property loss susceptibility is much reduced from existing vehicles?

Mr. EUSTIS. Anything that can be done to reduce damagability to automobiles would help the situation and we would support it.

Mr. SUTCLIFFE. I understand on the basis of the figures you have provided, 65 percent of the premium dollar now goes for property damage coverage; is that correct?

Mr. EUSTIS. Well, in the elements of the property damage coverage, property damage, auto physical damage, and collision.

Mr. SUTCLIFFE. So by improving the accident of loss picture in this area, we could effect substantial savings in your opinion?

Mr. EUSTIS. Yes; that combined with improved traffic control and improved law enforcement.

Mr. SUTCLIFFE. One point related to the need to consider the local factors such as medical payment levels and so forth that you enumerate in your statement. When insurance rates are set at the present time, are those factors plugged into the data base for setting the rates, or do rating boards utilize a national data base to determine rates for particular jurisdictions?

Mr. EUSTIS. They actually use both. I have a copy of a rate filing here with me. They use State claim costs and national claim costs. If the number of State claims is creditable, then they will use 100 percent. Otherwise, they will adjust it to national.

Mr. SUTCLIFFE. So there is at the present time in the rate structure some averaging?

Mr. EUSTIS. It could be. It would depend on the individual State, the size of the State or the territory that is involved.

Mr. SUTCLIFFE. Senator Hart, I have no further questions.

I thank the witness.

Senator HART. Gentlemen, thank you.

Again our apology for holding you so long.

This concludes the scheduled questioning for today.

We adjourn to resume at 10 a.m. tomorrow in this room.

(Whereupon, at 1:30 p.m., the hearing was recessed, to reconvene at 10 a.m., Wednesday, May 5, 1971.)

(The following was referred to on p. 468:)

## REPORT OF THE ARBITRATION COMMISSIONER

FRANK ZAL, Arbitration Commissioner

The miracle of Compulsory Arbitration, or trial by lawyer panels, a division of the County Court of Philadelphia, is about to complete its first decade of service in the administration of justice. It came into existence on February 17, 1958. Shortly thereafter, on May 19, 1958, the following headline appeared in a Philadelphia newspaper: "Clean Up of Civil Backlog Seen Within 18 Months." The article then proceeded to quote Judge Gerald F. Flood, who stated that the Common Pleas Courts can wipe out their backlog of 7,700 civil cases within the next 12 to 18 months. Nine years later, on June 18, 1967, the following headline appeared in another Philadelphia newspaper: "The Maelstrom in Our Courts; 6 Years Until Trial." This article was written by the Honorable Herbert S. Levin, a Judge of the Common Pleas Courts of Philadelphia, and in it he described the details of Court backlog and, in part, stated as follows:

"The trial reservoir of untried civil cases in Philadelphia's Common Pleas Courts contains over 16,300 cases. Some 90 percent of them fall into the category of trespass actions, a prime example of which is a personal injury suit growing out of an automobile accident.

"These cases frequently take more than six years to come to trial. During this period, there is no compensation for the plaintiff, who may be totally disabled and unable to work.

"The long delay is an unmitigated evil. Claimants have the following complaints about it: Many are forced onto relief rolls; many are unable to obtain proper medical treatment; out of economic necessity, many settle out of court for much less than they are due.

"On the other hand, defendants, like insurance companies and utilities, protest that they must set up huge reserve funds; that claimants add new injury complaints in the interim; and that a continuing check must be made to insure availability of clients and witnesses."

On September 13, 1967 the backlog was reported to be 19,219 cases.

Obviously, the 1958 prophetic statement did not materialize in all the jurisdictional areas. This, however, was not for lack of challenge or lack of effort on the part of the Philadelphia Bar Association or the Judiciary. The challenge was very clear and it cannot be said that the Philadelphia Bar "fell asleep at the switch" or failed to understand the challenge that was undeniably there. As a matter of fact, during the past ten years, many attempts were made to eliminate Court backlogs. Among the suggestions proffered were the following: Change the rules of the Courts, increase the number of Judges, better Court administration, the Diggin's Plan, certificate of readiness, the Keeton-O'Connell plan, etc. Of course, any plan which has the promise of reducing the awesome backlog of cases is deserving of the closest attention. There can be no denial that all these plans did receive close scrutiny. As a matter of fact, formal efforts to find a better way to dispose of trespass claims goes back for a quarter of a century. Yet, in spite of all these attempts, thousands and thousands of men, women and children have been waiting years for justice.

The Philadelphia Bar has often been first with advancement of legal services and purposes. Its members always recognized the needs of the community and have never avoided their obligations as community leaders and officers of the Court. We have recognized the fact that Court backlogs deprive the judicial processes of the esteem it should have and diminishes respect for the law.

The Philadelphia lawyers have every right to be proud of their heritage. No profession can boast of a more glorious and significant one. The history of the Philadelphia Bar is a record of self-sacrifice, determination, foresight and courage of its countless members. Someone once said that men of "mark" make poor runners because they are inclined to look back. Of course, all of us are also familiar with the story of Lot's wife, who turned into a pillar of salt, because she looked back. However, the Philadelphia Bar has not made the mistake of resting on its laurels, nor expected its past achievements to sustain

its profession's public stature today. It has not been "polishing brass" while the ship was sinking. Instead, it has indicated its concern over the need for greater respect for the law and has shown a willingness and ability to act. Thus, during the past ten years, it has actually done something about expediting justice for some of the motorists and some of the 1,750,000 injured and dead each year on American highways.

Judge Flood's prophecy did materialize in the area of civil cases not exceeding \$2,000.00. The Philadelphia Bar Association's answer to the challenge of Court congestion has been Compulsory Arbitration. This has resulted, both in tangible and intangible benefits. The tangible results of the progressive action, by means of trial by lawyer panels, with the cooperation of the Philadelphia Bar are readily measured by the number of cases disposed of during the past decade, over 62,000 cases, and the average waiting period is now reduced to three months. The intangible results, namely, a greater confidence in our legal processes, resulting from the more timely administration of justice, although less easily measured, are no less real and of far greater importance.

And so, during the past ten years, this outstanding program of public service by members of the Philadelphia Bar, unmatched by any other Bar Association, has brought honor upon the City of Philadelphia and, of course to the Philadelphia Bar Association, because of the outstanding devotion to the public interest and to the welfare of our citizens, demonstrated by members of the Philadelphia Bar.

Curiously, this experiment to clean up congested courts did not originate in metropolitan Philadelphia—where it is so spectacularly successful—but in a rural section of western Pennsylvania. Butler County after World War II had only one Judge, a backlog of 500 civil suits, and the Common Pleas Court was three or four years behind in its docket. A pair of enterprising attorneys decided it was time to blast things loose. J. Campbell Brandon and Carmen V. Marinaro found their

opportunity in a long-forgotten act of 1836 that provided that either party in a civil suit could *voluntarily* submit to arbitration. The attorneys went a step further to urge putting teeth into the old law and making arbitration *compulsory*. They drew up a proposal for automatic arbitration of all civil cases involving \$500. or less and laid it before Butler County Commissioners. Brandon and Marinaro showed them how it would eliminate costly jury trials and relieve an overburdened Court. Judge William B. Purvis heartily approved the reform and the new rules of the Court that had been drafted to put compulsory arbitration into effect. The first trial was an automobile damage suit that was disposed of in one hour. Within two years, arbitration had wiped out Butler County's 500 case backlog.

"There were murmurs that Judge Purvis may have stretched the law a bit by introducing compulsory arbitration through court order" recalls lawyer Brandon. "But it proved to be a fast, inexpensive form of justice; a kind of 'poor man's court', and succeeded far beyond our expectations." As far as Philadelphia was concerned the beginning of compulsory arbitration was introduced by Section 3 of the 1957 act, which was signed by Governor George M. Leader on June 20, 1957. This was an amendment to the act of 1836, June 16, P. L. 715.

Obviously, a serious constitutional question was presented by this act, which brought about trial by lawyers' panels. In the case of *Application of Harvey A. Smith*, 381 Pa. 223, 112 A. 2d 625 (March 23, 1955), 350 U. S. 858 (1955), the Supreme Court of Pennsylvania sustained the Act. The constitutional attack had been that the act violates the due process guarantee of the Fourteenth Amendment and the right to jury trial conferred by Article I, section 6, of the Pennsylvania Constitution which provides that, "Trial by jury shall be as heretofore, and the right thereof remain inviolate." The majority held that a reasonable condition could be imposed on a litigant's right to a regular court trial, and that the requirement that the county be reimbursed for arbitrators' fees, even though the payment

to the county was not thereafter recoverable as costs, was not per se an unreasonable condition.

Thus, with the constitution question out of the way, Compulsory Arbitration, which had its beginning in Philadelphia on February 17, 1958, met with immediate success. By the end of the first year, 11,841 cases were removed from the Philadelphia court backlog and numerous favorable comments began to appear in the Philadelphia press. We particularly point with pride to an editorial which appeared in one of the newspapers on February 19, 1959: "Those who have despaired of justice lagging in hopeless backlogs, and those who have called for more and more courts as the only way out, have something to ponder in this one year record. Surely the technique can be applied to many other areas of the pettifogging litigation which claims the city's tribunals. The Municipal Court will be happy to show how it is done." At the end of the first five years, 33,982 cases had been removed from the court backlog. On February 13, 1963, Mayor James H. J. Tate presented an official tribute to Compulsory Arbitration. On February 18, 1963 ceremonies commemorating the fifth anniversary were held in Room 650, City Hall and laudatory remarks were made by members of the judiciary, the Bar Association and City Council. On January 27, 1964, there appeared an editorial in one of the leading Philadelphia newspapers, under the caption "Unhappiness Report", detailed current problems in the courts and brought out the fact that "the optimistic side of the report is that the County Court is an outfit which goes to work whenever the chips are down. It has performed judicial wonders in cutting into the backlog of minor damage suits, for example." This, of course, was a reference to the method of trying cases by means of Compulsory Arbitration or Trial by Lawyer Panels.

Of course, we are not unmindful of the fact that some of our critics might say that this simplified procedure might serve to encourage the filing of new claims. This they say would be self-defeating. Yet, even if it were so, society is still better

served if all citizens, poor or rich, have ready recourse to prompt legal relief. However, as far as we can determine, compulsory arbitration procedure has not appreciably stimulated the filing of claims, but we are convinced that it has increased the settlement of claims before suit is ever instituted. Another possible criticism has been that the flexibility and informality of compulsory arbitration tends to break down the traditional safeguards built into the judicial process. However, in relation to the small claims nature of these cases, greater "justice" is apt to result from speedy disposition, than from meticulous attention to mechanics of the judicial process. However, we are not entirely convinced that there is any less attention to the safeguards in the trial of cases before lawyer panels than there is when a case is tried before a judge without a jury. What is significant, of course, is that no one can deny that litigation is not piling up mountains high, and justice is not delayed.

All this was made possible because Compulsory Arbitration, a division of the County Court, is a tribunal with the largest amount of judicial manpower in the world. The majority of our 2,500 panel members, who act as the "judges" and the 2,500 court room facilities are actually available to try cases all year long. At this time we can also say with pride that with more than 60,000 cases under our belt, we are more convinced than ever that, with exception of Compulsory Arbitration, there is no other single major cure for the congestion in our courts, particularly in matters relating to trespass action.

An unbiased survey at this time would show that it is almost the universal opinion among all litigants trying their cases in Compulsory Arbitration, that justice is administered with real judicial-like stature. It would also indicate that justice is being meted out with courtesy and with business-like efficiency. This, we are certain, will be corroborated by most of the lawyers, litigants, witnesses, newspaper men and others who have come before the 2,500 Philadelphia lawyers who have acted as panel members.

Our list of current panel members still includes many senior members of the Bar who are prosperous practitioners, with busy calendars, who are willing to answer the call of public service. We are also proud of the fact that many of our arbitrators, who have served during the years, are Federal, State or County legislators, the Lieutenant Governor of Pennsylvania, Chancellors of the Philadelphia Bar Association, the Attorney General of Pennsylvania, the City Solicitor of the City of Philadelphia, District Attorneys of the County of Philadelphia, and some are now Judges in the County, Common Pleas, Supreme and Federal Courts. The following members of the Judiciary were former members of panels: Hon. Joseph E. Gold, Hon. Clifford Scott Green, Hon. Stanley M. Greenberg, Hon. Theodore S. Gutowicz, Hon. A. Leon Higginbotham, Jr., Hon. D. Donald Jamieson, Hon. Gregory G. Lagakos, Hon. Herbert S. Levin, Hon. Alfred L. Luongo, Hon. John R. Meade, Hon. Frank J. Montemuro, Jr., Hon. Thomas D. McBride, Hon. James Thomas McDermott, Hon. Thomas M. Reed, Hon. Samuel H. Rosenberg, Hon. Theodore B. Smith, Jr., Hon. Edmund B. Spaeth, Jr., Hon. James L. Stern, Hon. Juanita Kidd Stout, Hon. Charles R. Weiner, Hon. Charles Wright, Hon. Robert N. C. Nix, Jr., and Hon. Vito F. Canuso.

Our panel members are a real cross-section of the Bar and so, of course, are also the attorneys for the litigants trying the cases before our panel members. Thus, there have been instances where counsel for the litigants were young lawyers and the arbitrators were "old time members of the Bar" and vice versa. On one occasion, the chairman of one of the panels was a "veteran" with one solid year behind him—the three "neophytes" who represented the litigants were William A. Gray, Esquire, Thomas D. McBride, Esquire and Edward H. Cushman, Esquire, who, at that time, had amassed one hundred forty-two years at the Bar. The procedure, of course, has also served as an excellent training program for lawyers. Of course, most litigants would be disturbed to know that a lawyer was "cutting his judicial teeth" as an arbitrator in a particular case. From the lawyer's

point of view, serving as an arbitrator provides invaluable experience. The advancement of knowledge in such an important profession ultimately benefits the community.

As already indicated, Compulsory Arbitration, or trial by lawyer panels, was a "smash hit" in Philadelphia right from the very beginning. In the very first year of its operation, Compulsory Arbitration was a factor in winning, for the Philadelphia Bar Association, the American Bar Association award of merit for 1958, for the outstanding program among Bar Associations in cities of more than 100,000 population. The same first year it also figured in the annual award of the Pennsylvania Bar Association. It was also one of the factors in the Philadelphia Bar Association's receiving the American Bar Association's 1967 award of merit for excellence. Throughout the past ten years, we have continued to receive laudatory attention throughout the world in various editorials, articles, law reviews, Court decisions, newspapers, radio and television, including foreign language media. Just to mention a few, we point to an article in the April 1960 issue of the Readers Digest (page 197); March, 1965 issue of the Law Society Gazette, British publication; Harvard Law Review, volume 74, page 3, January, 1961; University of Pennsylvania Law Review, volume 113, page 1117; May, 1960 Commercial Law Journal; March-April, 1960 Dicta; the Monthly Journal of the Denver Bar Association; the Colorado Bar Association and the University of Denver College of Law; the New York Times; the Philadelphia Legal Intelligencer; the New York Law Journal, January 10, 1967; February 1967 of Judicature; June, 1966 issue of the Verdict, publication of the Philadelphia Trial Lawyers Association, and 421 Pennsylvania Supreme Court Reporter 145.

Leading citizens in the community have also taken time out to write to us. Thus, on February 6, 1967, William A. Schnader, Esquire, wrote as follows: "Again I congratulate you on the results accomplished by the Compulsory Arbitration Division, and only hope that in any legislation intended to consolidate the Common Pleas and County Courts extreme care will be taken to

see that the work of your Division be not disturbed. If anything is done to modify your work it should be an increase in the jurisdictional amount which is subject to compulsory arbitration." The following letter from United States Senator Hugh Scott, on June 19, 1967: "The manner in which the Court has handled its task and the worldwide publicity given this system—gives one reason to be proud." A letter was also received from United States Senator Joseph S. Clark—June 12, 1967: "Certainly the precedent-setting success of the lawyer panels in Philadelphia deserves to be widely known and commended. The fact that approximately 60,000 cases have been disposed of by lawyer panels since 1958 speaks eloquently of the importance of your pioneering work. The County Court of Philadelphia and your Commission can be proud of your achievement, and so can all Pennsylvanians."

Compulsory Arbitration was also proud to participate in the Law Day exercises, which were held in Court Room 453, on Wednesday evening, April 27, 1966. On February 17, 1967, there was a special court room ceremony presided over by the Hon. Adrian Bonnelly, President Judge of the County Court, for the purpose of marking the beginning of the tenth year of Compulsory Arbitration.

The Arbitration Commissioner has also received quite a bit of attention during the past ten years. On April 10, 1959, a staff writer of the Evening Bulletin, in describing the progress and mechanics of compulsory arbitration, referred to the Arbitration Commissioner as the "dynamo" behind the system. The April 1965 edition of the Shingle, published by the Philadelphia Bar Association had a profile of the Arbitration Commissioner, Frank Zal, written by Sylvan M. Cohen, Esquire, and the front cover carried the Commissioner's picture with these words: "Acumen—imagination—generous disposition." On February 16, 1967, John C. Calpin, of the Evening Bulletin editorial staff, had a lengthy article on the editorial page again describing the mechanics of compulsory arbitration and featured a large

picture of the Arbitration Commissioner. The Commissioner was also the recipient of the 1967 Fidelity Award.

On a number of occasions, the Arbitration Commissioner has been invited and did address various groups who were interested in the problems of court backlog. These appearances were not limited to Philadelphia or Pennsylvania. On August 7, 1964, he was invited to address and did appear before the National Conference of Court Administration Officers in New York City at their tenth annual meeting. He also participated in two Bench and Bar conferences, namely, in 1962, at the fourth annual Bench and Bar conference in Atlantic City, New Jersey, at which time the panel consisted of Sylvan M. Cohen, Esquire, Wilfred R. Lorry, Esquire, Arbitration Commissioner Frank Zal and the Honorable Nochem S. Winnet, who was the moderator. He also appeared on a panel with the Honorable James L. Stern and Sylvan M. Cohen, Esquire, at the eighth annual Bench and Bar conference in Atlantic City, New Jersey, in 1965. The Arbitration Commissioner has also written numerous articles which have appeared in various publications and we particularly point with pride to the November 1961 issue of the American Bar Association, page 1101, and the editorial, page 1095; the August 1964 issue of Law Office Economics and Management, page 131; also April-May 1967 issue of Trial, page 52 and the June 21, 1965 issue of the Legal Intelligencer of the Monday Bar report of the Philadelphia Bar Association, which featured the following article, "Compulsory Arbitration funds sought to effect the reduction in waiting period." This article was subsequently published by the Bar Association as a reprint for general distribution.

During the years we have also developed an added feature which we call "instant" arbitration. Thus, since 1964, cases involving amounts exceeding \$2000., in which lawyers, while clients and witnesses were actually waiting in court rooms for trial, agreed among themselves that the cases were to be tried by means of Compulsory Arbitration and sometimes by the direction of the court were referred to "instant" trial. In

these instances at the direction of the court a panel of three lawyers was immediately mobilized by a telephone call by the arbitration commissioner and in a matter of minutes these cases were on trial and disposed of without delay. These cases were disposed of in the private office "court room" of the panel member who was designated as chairman. In the absence of compulsory arbitration, these cases would have had to await trial by a judge or judge and jury and probably would not have taken place the same day, and maybe not for months to come. However, because of this "instant" reference to compulsory arbitration, the court was not only able to expedite dispositions of 50 cases but, in addition, was able to give its immediate attention to other cases. These "instant" cases were serviced without any additional charge to the County of Philadelphia and our statistics indicate that the cost per case was only approximately \$62.00. Consider and *compare the waiting period and cost per case* to the litigants and to the City, if these cases had to be tried by a Judge or Judge and jury.

A review of appeals, indicated that out of approximately 63,000 cases processed from February 17, 1958 to December 31, 1967, 3,967 were appealed to the County Court. However, it is significant to note that out of all the cases appealed only a small percentage were actually tried. Most of them are settled after the appeal is taken and at some stages of the process, before the actual trial in Court. Of those actually tried in Court, the greatest percentage upheld the disposition made by the panels. We leave it to our readers' judgment to draw their own conclusion as to whether or not the number of appeals were a reflection on the record of the arbitrators. We would also like to point out that among the appealed cases there were quite a few that were taken by marginal insurance companies who are now in liquidation and it is quite evident at this time that they were only taken for the purpose of delay.

In the area of Court reviews, we have had a number of significant decisions during the past ten years. These cases are now part of our annual reports, the most significant one being

the handling of the problem of "record costs". This was disposed of in *Budde v. Sandler*, 204 Superior Court, page 36. To this previous list we should now like to add the case of *Coates v. Rodemoyer*, 41 D. and C. 2d, page 593 which brought out the distinction between an appeal bond and a recognizance in matters pertaining to appeals from awards in compulsory arbitration.

Another case is that of *Bacon American Corporation v. Henise Tire Service, Inc.*, 41 D. and C. 2d, page 562. Here the Court held that an appeal from an award, an amended answer containing a counterclaim, even though within the jurisdictional limits of compulsory arbitration, will be allowed to be heard during the appeal, in order to avoid multiplicity of actions.

Another interesting case is that of *Lanigan v. Lewis*, Superior Court of Pennsylvania, October Term, 1967, No. 138, which held that the practice in Philadelphia County and some other counties, of the Prothonotary entering an attorney's fee for the benefit of the attorney representing the winner of an award in arbitration in an arbitration proceeding, when the award is appealed, was unauthorized.

At present there is also pending an answer to the question whether or not when an appeal of arbitration is quashed because the costs in arbitration were not paid, does the loser have the right to request the return of money paid to the County in reimbursement for arbitrators' fees. This is now pending in the cases of *Art Casting Co. v. Vernon Cox and Co.* and *Cohen and Snyder*, County Court, September Term, 1962, No. 9779 D; and, *Vernon Cox and Co., Inc. vs. Art Casting Company*, Defendant, *Giftwares Company*, *Pier-Angeli Specialty Co.*, *Garnishes*, County Court, December Term, 1964, No. 2952 B. See also *Bucciarelli v. DiCicco*, 14 D. & C. 2d 61 (1958).

We also would like to call to the attention of the members of the bar the following three cases which likewise deal with the question of costs and the return of the arbitrators' fees to the County when an appeal is taken on behalf of a minor, or on

behalf of the City of Philadelphia: Sean Roberts, a minor, et al. vs. Walinski, Defendant and Jean J. Roberts, Additional Defendant, County Court, December Term, 1964, No. 3569 D; George Roberts, a minor, et al. vs. Walinski, Defendant and Jean J. Roberts, Additional Defendant, County Court, December Term, 1964, No. 3568 C; and Sylvia Zucker and Harry Zucker vs. City of Philadelphia, County Court, March Term, 1966, No. 18763-C.

In addition, we should like to pinpoint a few interesting cases which deal with the form of affidavit of no delay which has to be taken when a case is appealed from arbitration: *DeRica v. Derri*, 400 Pa. 473; 162 Atlantic 649 (1960); *Firmly Yerger vs. Griffith*, 1 Chester 200 (1878); and *Novotony vs. Danoro Borough*, 59 Pitt. 143 (1911).

We are also proud to point out that the rules of Compulsory Arbitration which were adopted December 20, 1957, have stood up firmly and with very few changes. There were amendments on February 6, 1958, June 20, 1958, May 25, 1962 and January 20, 1967. In the last two amendments Rule II B made a slight change in the grouping of the alphabetical list used in the appointment of arbitrators; and Rule III-H was also amended to delete the word "record" and to substitute instead the words "Transcriptions of the testimony." Our original forms have also been retained, with the exception that recently we prepared and had approved a new report and award form and a new trial order form. Significant changes in the rules of evidence so as to permit the introduction of certain evidence by affidavit, particularly with reference to repair and medical bills, have been approved on September 15, 1967.

And now a word about the cost of trial by lawyer panels. The first appropriation from City Council for arbitrator fees was at the rate of \$85.00 per case. Subsequently, beginning with 1961, at the suggestion of City Council, arbitrators were asked to reduce their fees by \$5.00 per case and since that time the allocation has been on the basis of \$70.00 per case. However,

the actual average cost per case is only \$62.00, and during the past ten years, the total allocation for arbitrators' fees has been \$2,502,011.00, or an average of \$250,000. per year. Considering that during these ten years we have processed approximately 62,000 cases, it is indeed a real bargain when you consider the millions of dollars saved by the City of Philadelphia by elimination of the expense of fees that would have been paid in salaries to various Court personnel, maintenance of Court room facilities, \$9.00 a day per juror, etc. Our statistics also show that in the past ten years, lawyers who have participated in trial by lawyer panels have each served a total of seventeen rounds, for an average total of fifty-one Reports and Awards, and have earned approximately \$122.00 per year. This certainly has not made them rich but, of course, participation in compulsory arbitration is a public service and is not a money making proposition.

It is also significant to note that in many instances, some of the hearings were drawn out, sometimes taking as much as a full day and, in some instances, more than a day, and yet there were a very few requests or petitions for additional compensation. During the past ten years there have been a total of 77 petitions for an allowance of \$4,290.00. On the side of the attorneys for the litigants, we wish to point out that during the past ten years it has only been necessary to refer 832 cases for sanctions, due to the fact that these cases, by reason of attorneys' requests of unreadiness had to be continued by two separate panels on two different occasions. This in itself is not a bad record.

Finally, a statistical word as to the human element involved. While the responsibilities of the Arbitration Commissioner have been many because of the numerous details involved in handling approximately 2,500 arbitrators, the work has also been most gratifying due to the wonderful cooperation exhibited by the Judiciary, the official family of the Bar Association and members of the entire Bar. We are particularly grateful to Hon. Hazel H. Brown who was the President Judge when the

details of the plan were formulated, and who gave unstintingly of her time and interest so that a staff and office facilities were quickly assembled. We are grateful to the Hon. Adrian Bonnelly, President Judge of the County Court, who celebrated his Diamond Jubilee in May of 1965. By reason of his long-standing national reputation, and because of his enthusiasm for the accomplishments of the miracle of Compulsory Arbitration whenever and wherever he was invited to address various gatherings throughout the breadth and width of this great U. S. A. he never missed an opportunity to herald the accomplishments of the Philadelphia Lawyer panels which have been a shining beacon in the mass of Court congestion and thus we attained additional stature.

The original rules of arbitration prepared by the first Court Committee on Compulsory Arbitration, consisting of Hon. Francis F. Burch, Hon. Felix Piekarski and Hon. Victor J. DiNubile, have held up very firmly. A great deal of credit should go to the Judges of the Municipal Court, who enthusiastically and with a great deal of devotion, worked long and many hours in order to promulgate the rules governing arbitration. Since 1966 we have been operating under the guidance of a County Court Judicial Committee consisting of Hon. James L. Stern, Chairman, Hon. Gregory G. Lagakos and Hon. Clifford Scott Green. Over the years we have also been directed by a Bar Association Committee consisting of a large committee of lawyers under the guidance of a Chairman. From 1958 to 1962, it was Sylvan M. Cohen, Esquire who, with his committee, did a magnificent job in guiding in the preparation of instructions to the Bar and in handling the task of answering numerous letters and inquiries during the first five years. Thereafter, the following leaders of the Bar were Chairman, namely, Raymond J. Broderick, Esquire (1963) who is now the Lieutenant Governor of Pennsylvania; William Bruno, Esquire (1964), Joseph N. Bongiovanni, Jr., Esquire (1965) and Joseph V. Restifo, Esquire (1966 to 1967).

During the latter years we have also had the services of William H. Brown, III, Esquire, as Vice Chairman, Leonard M.

Sagot, Esquire, as Secretary and Joseph N. Bongiovanni, Jr., Esquire, as liaison to the Board of Governors. We are grateful to acknowledge the fact that as a result of the effort of this Committee the status of Compulsory Arbitration has been enhanced to the extent where we have a monthly statistical report published regularly in the Legal Intelligencer, and since September 23, 1966, the findings of panel members are likewise published daily in the Legal Intelligencer on the same par with all of the dispositions in the Federal, State and County Courts. Of this we are proud.

We also wish to express our gratitude to the strong line of Chancellors who have been in office during the past ten years and whose leadership gave impetus, vitality and direction to our division: Walter Alessandroni, Jr., Esquire, Vincent P. McDevitt, Esquire, David Berger, Esquire, Theodore Voorhees, Esquire, Marvin Comisky, Esquire, Robert L. Trescher, Esquire and Arlin M. Adams, Esquire. To their yeomen, the hard working Committee members and Chairman, go our accolades. We are also grateful for the fact that the current Chancellor, Arlin M. Adams, has issued a plea asking that members of the Philadelphia Bar Association's Board of Governors who were not participating on panels should make every effort to join the lawyers participating in Compulsory Arbitration and we are happy to state that the response has been most gratifying. Chancellor Adams has also been in the forefront in spearheading the Bar Association's request that the legislature increase the jurisdiction of compulsory arbitration to \$3,500. It has also been called to our attention that currently Robert L. Felice, a third year law student at the Villanova Law School, in his seminar in judicial administration, is writing a thesis on the question: Should the jurisdictional amount be raised from \$2,500. to \$5,000.

We also wish to point out that arrangements are now being made by the Philadelphia Bar Association to present certificates of achievement in February, 1968 to all of those lawyers who will have participated as panel members during the first ten

years. Indications are that there will be a specially arranged ceremony. Attached hereto is a list of the approximately 1350 panel members who will be receiving certificates.

Finally, certainly any resume, legend or anthology of the first decade of compulsory arbitration would not be complete without expressing our thanks and debt of gratitude to the Mayor of Philadelphia, to the members of City Council, to the various City departments and the staff of the Legal Intelligencer, who have all given us their utmost cooperation. Last, but not least, the very office and staff of the Arbitration Division. Someone once said, although we have never met that individual, that the first hundred years are the hardest. However, without going into any research as to the reliability of that statement, we can certainly, from personal experience, attest to the fact that the first decade of Compulsory Arbitration was not exactly a bowl of cherries or a path of roses. On the other hand, just like when handling a rose bush, we must admit that while at times we have felt the sting of thorns, we have also enjoyed the sweet aroma of all the accolades. As a matter of fact, we are a great believer in the ideas expressed by Frank L. Stanton, who said as follows:

"This world that we're a-livin-in  
Is mighty hard to beat;  
You git a thorn with every rose,  
But ain't the roses sweet."

On the whole, however, the Bench and Bar have been kind and helpful to us. It has been a joy to work with wonderful people and for wonderful people.

Actually, of course, the story of Compulsory Arbitration for the past ten years is a story of pressure from "without" and "within". We began Compulsory Arbitration with 7,102 trial orders, a lack of staff and space. With the passing years, our space situation has not improved. As for staff, due to competing wage increases afforded outside of our office, some of our personnel has been changing, thus necessitating the retraining of

inexperienced staffers. The wealth of experience embodied in a trained employee is hard to replace. Our office space has not only been inadequate for our staff, but unsuitable as well for many of the lawyers who come in to see us daily.

However, we are very hopeful and still look forward to the time, maybe in the near future, when we will have adequate space and will be able to accommodate the many people coming into our office. But in spite of all these drawbacks, we have enjoyed good relations with all the members of the Bar and are happy to attest to the fact that during the past ten years we have, with some measure of success, answered thousands of questions proposed to us by lawyers, panelists and attorneys for litigants. At the same time, we are also very proud of the dexterity and efficiency of our staff who, over the years, have developed a very efficient filing system and it is so up-to-date that we are able to find the status of any case within a matter of seconds. Our staff has often been flattered by the remarks of lawyers who have told us on many occasions that our personnel has the memory of a computer and the sagacity of a Solomon.

And so, as we close the curtain on the first decade of Compulsory Arbitration, we do so with a great deal of pride and we do not look at the number of transactions and cases disposed of through our office as mere statistics, but rather in the terms of the affairs of human beings who, by reason of Compulsory Arbitration, have been spared the unjust experience of suffering a hardship usually caused by Court delays. And so, as we envision the happy faces of the thousands of litigants who are no longer waiting in line to obtain justice, we, in a sense, feel that we have been well rewarded.

**TABLE 1**  
**SUMMARY OF ARBITRATION CASES: 1958 TO 1967**

Action on cases referred	To Dec. 31 1963	To Dec. 31 1964	To Dec. 31, 1965	To Dec. 31, 1966	To Dec. 31, 1967

<b>Consolidated .....</b>	<b>117</b>	<b>77</b>	<b>48</b>	<b>49</b>	<b>67</b>

The following members of the Philadelphia Bar Association received Certificates of Achievement for meritorious and distinctive service rendered for more than ten years as a member of Trial-By-Lawyer panels in the County Court of Philadelphia, Pennsylvania. The certificates have on them the Seal of the City of Philadelphia; The Philadelphia Bar Association; The County Court of Philadelphia; and were signed on behalf of County Court by Adrian Bonnelly, President Judge; James L. Stern, Chairman, Judiciary Committee for Compulsory Arbitration; Frank Zal, Arbitration Commissioner. They were also signed on behalf of the Philadelphia Bar Association by Lewis H. Van Dusen, Jr., Chancellor; Sidney Schulman, Chairman, Committee for Compulsory Arbitration and Leonard M. Sagot, Secretary, Compulsory Arbitration Committee.

 Hon. Theodore B. Smith, Jr.  
 Hon. Edmund B. Spaeth, Jr.  
 Hon. James L. Stern  
 Hon. Charles Wright  
 Hon. Charles R. Weiner

## BRIEF SUMMARY OF \$10,000 ARBITRATION PROGRAM TO DATE

Approximately 30,000 stipulations were mailed out covering some 9000 cases.

To date we have received 18,100 signed stipulations. Of this number we have been able to assemble some 4200 cases in which all counsel have signed the stipulation and which are therefore ready for assignment under the new program (since individual stipulations were sent to each attorney in the case only those in which all counsel in a particular case have signed can be sent to arbitration).

In addition to the above we have received word that in excess of 1000 cases have been settled as a result of the initiation of this program. Accordingly of the 9000 cases involved in the backlog in this particular type of case we are in a position now where some 5200 have been or will be disposed of in the very near future either by settlement or by arbitration.

A substantial portion of the remaining 4000 cases will also be sent to arbitration as soon as we receive returns on the remaining number of stipulations which have not as yet come in and which number about 7000.

We have received some 680 refusals, a good number of which were based on the fact that the cases should be in compulsory arbitration and a spot check of these indicates many will be sent to the compulsory arbitration program. Some 2500 cases involve matters in which counsel allege that the amount involved exceeds \$10,000 and are thus in the Major Case Program.

Approximately 1500 cases have been referred to arbitration under this new program. Since we require at least thirty (30) days notice of the hearing we have not as yet been able to compile any substantial statistics on the workings of the program, however, we have conducted an informal survey among the busier plaintiff and defendant attorneys and the results of this survey indicate that the program will be very successful. This survey shows that the appeal rate is running somewhere around 10%, which is the same rate that has been running in the compulsory arbitration, which means in effect that one out of every ten cases in which a finding is made is being appealed. In addition, we find that approximately 50% of the cases are being settled immediately prior to or at the hearing. The findings have been averaging somewhere in the neighborhood of \$2500 to \$3000, with the highest finding reported being \$9500 and the lowest being \$250.

In cases in which there are settlements, of course, the question of any appeal becomes moot and the fact that the settlement rate is running in excess of 50% bodes well for the entire program.

It would appear that on a projected basis that if the figures on the initial survey are correct that within one year we will have disposed of some 9000 cases, of which there should be no more than 900 appeals and many of these will be settled prior to the time that they are actually tried. This being so in the very near future the time lapse between the date a case is ready for trial and the date it is assigned to trial will be no more than one year this reduced from a time lapse of some 4 to 4½ years which was in effect prior to the institution of this program.

The comment among the Bar as well as the litigants has been generally favorable since the program results in prompt disposition of the case, which is beneficial to both plaintiff and defendant.

[Reprinted From *Journal of American Insurance*, Chicago, Ill.]

**Swift justice in many civil cases  
speeds the payment of small claims.**

The other day, Paul Post of Philadelphia received a check for \$1,853.28 from the insurer of a driver whose car had struck him at a street corner near his home. Post had not been critically injured, but his ankle was fractured and he needed extended medical care and had to miss four weeks of work. Neither the claim nor the payment are notable in themselves. Of greater interest is the fact that the accident happened less than 6 months ago and that Post filed a lawsuit to recover his losses. Under the conditions of a few years ago in Philadelphia, Post would have had to wait until 1974 or 1975 before his case would have moved up the crowded court docket to trial.

But now "small claims" such as Post's go quickly to panels of volunteer lawyers for arbitration, eliminating lengthy court delay. This use of automatic arbitration has now been in effect long enough to serve as a test of whether the approach might receive wider application. The experiment may be of nationwide significance because of the impact which delay in certain courts of lesser jurisdiction has had on the operation of the entire fault system of law in these localities. The fault system has been criticized for causing inadequacies, notably in the reparation of auto accident damages, which may in fact be traceable to overloading of courts.

For this reason, mandatory arbitration of small claims is being actively considered by a number of states as part of larger packages of auto insurance reforms.

The way mandatory arbitration works in Philadelphia is that lawyers willing to serve as arbitrators register with the bar association and are listed on a roster. Cases are grouped in threes as they come in and are assigned to panels made up by selecting names at random from the list. The first attorney picked is designated panel chairman.

In the case of Paul Post, he, his lawyer, the defendant and defense counsel, witnesses for both sides, and the other two members of the panel were all asked to meet at the office of the panel chairman's law firm. (The rules call for a hearing within 30 days of the arbitrators' appointment.) Sitting around a table in the firm's law library, the panel heard testimony from witnesses and cross-examined them according to conventional trial rules. However, the informality of the setting encouraged a somewhat more conversational manner of questioning to bring out all the relevant facts in the case. An affidavit from Post's doctor was taken in evidence of his medical costs.

In a little over an hour, the panel had satisfied itself as to the facts and the chairman adjourned the hearing. A week later, the panel got together over lunch to compare their views on the case. (They're required to render judgment within 20 days of the hearing.) There was general agreement that Post's claim was valid, but that his loss claim was some-

## Arbitration: The Philadelphia Story

what high. A figure was set based upon the evidence of loss presented at the hearing. Within another week, the chairman had completed his write-up of the opinion, his secretary had typed it, and Post's attorney and the defendant's had received copies.

As soon as the defense counsel learned that Post and his lawyer did not plan an appeal, he asked the insurer to issue a check in the amount indicated in the judgment. Had an appeal been desired, a new trial would have been scheduled in the Philadelphia Court of Common Pleas upon payment by Post of the costs of the arbitration proceedings.

What do the professionals most closely involved with the Philadelphia arbitration system think about its operation? Says one insurance claimsman: "My company believes that the only good case is a closed case. The arbitration panels are 600 to 700 per cent faster than the courts and the quality of justice is at least as good. So we have to be happy. The lawyers are happier too—this system clears the junk cases out of their offices."

The Municipal Court of Philadelphia installed mandatory arbitration on February 17, 1958, for all cases in which the amount in controversy was under \$2,000. Early this year, the limit was raised to \$3,000. Prior to 1958, a huge backlog of cases had built up, causing trial delays of 24 to 30 months. In its first decade, through 1967, arbitration disposed of more than 60,000 cases and the waiting period for a regular trial was reduced to three months. In 1968, the delay was further reduced so that it is now possible to get a case heard in 30 days.

"The reason this program has been so successful," says Philadelphia's commissioner of arbitration, Alex Bonnie, "is due to the cooperation and enthusiasm of the lawyers themselves. Service on the arbitration panel is purely voluntary, and yet we have a pool of 2,500 lawyers to draw from. It's especially heartening to see the young men just recently admitted to the bar coming in to sign up for duty as arbiters. And, of course, the current list of prospective panel members includes many senior members of the bar, prosperous practitioners with busy calendars, who still answer the call of public service."

How do the claimants themselves like the system? If the low appeal rate is an indicator, they also like its operation. According to Daniel P. Ryan, a member of the Defense Research Institute, "In the 10-year period ending on December 31, 1967, over 62,000 cases were referred to arbitration. Statistics on concluded cases indicate an appeal rate of less than five per cent, and only a small percentage of appealed cases have been actually tried. Of those tried, a majority have resulted in disposition similar

to that of the arbitration panel." Adds Ryan about the arbitration system in general, "This plan was greeted with skepticism when first suggested. However, one cannot quarrel with its success. I urge the compulsory arbitration of small claims as an ideal solution to the backlog problem in appropriate jurisdictions."

And the advantages of arbitrating small claims apparently don't end with clearing up court backlogs. The Philadelphia story is also one of reduced costs. Commissioner Bonnie estimates that the cost of arbitrating a case is about 10 times less than the cost of trying the same case in court. The sizeable difference stems from the elimination of the costs of salaries for court personnel, maintenance of courtrooms, payment of jurors and other necessities of court operation.

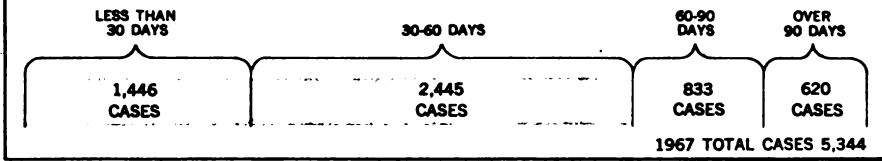

The first appropriation from the city council for arbitration fees was pegged at \$85 per case. Since 1961, the allocation has been on the basis of \$70 per case. However, the actual cost per case has turned out to be only \$62. During the first 10 years, the total allocation for arbitrator fees was \$2,502,001—an average of \$250,000 per year. As Commissioner Bonnie points out, this figure is many times smaller than what court trials of the same cases would have cost.

The only major challenge to the system was on constitutional grounds. Shortly after passage in 1952 of the legislative act allowing county courts to set up arbitration panels, the act's constitutionality was challenged. It was attacked as a violation of the due process guarantee of the Fourteenth Amendment

### A DECADE OF ARBITRATION: Summary of Performance From 1958 to 1967

Total cases referred to compulsory arbitration	66,025
Reports and awards filed...	40,541
Settled and discontinued cases.....	15,831
Miscellaneous dispositions.....	3,749
Total cases completed.....	60,121
Deferred cases.....	338
Continued cases.....	626
Hold cases (at request of counsel).....	2,234
Total cases in process but not ready for trial.....	3,198
Cases processed and pending before panels...	1,249
	<u>1,249</u>
Total cases processed.....	64,568
Unassigned cases.....	1,457

and the right to trial by jury conferred by the Pennsylvania Constitution. However, the act was upheld by the Pennsylvania Supreme Court on the basis that a reasonable condition could be imposed on a litigant's right to a regular court trial, and that the requirement that the county be reimbursed for arbitrators' fees was not, in itself, an unreasonable condition.

Other critics of arbitration have said that the simplified procedure encourages the filing of new claims. However, in an article published in 1968, the former arbitration commissioner, Frank Zal, stated that he could find no evidence of this, but only evidence of increased settlements of claims before suits are ever instituted.

Occasionally it is charged that the flexibility and informality of mandatory arbitration tends to break down the traditional safeguards built into the judicial process. One can argue, however, that justice is best served by speedy disposition of cases, and as former Commissioner Zal reported in 1968: "It is almost the universal opinion among all litigants trying their cases in mandatory arbitration that justice is administered with real judicial-like stature... justice is being meted out with courtesy and business-like efficiency." Commissioner Bonnie says that the continuing success of the system means that the limit for size of cases will probably soon be raised to \$5,000.

Widespread praise of the way mandatory arbitration works in Philadelphia has led to the kind of interest taken by the International Association of Insurance Counsel and the Defense Research Institute in applying it in other jurisdictions. The American Mutual Insurance Alliance is also a strong backer and has appeared before several state legislatures considering auto insurance reforms to testify in favor of arbitration of small claims as part of an integrated reform package. A spokesman for the Alliance told a special commission on auto insurance in Massachusetts that "We believe that Pennsylvania's success with the arbitration of small claims is proof that the problem of court delay, where it exists, can be solved without depriving people of the

right to a jury trial. It also deflates the unsupported arguments of those who advocate drastic changes in the auto reparations system as the only way to unburden the courts and provide for prompt settlement of claims."

Complaints that the present reparations system, based on holding drivers responsible for their behavior behind the wheel, is too slow and too expensive are met head-on by arbitration systems like the one in Philadelphia. Together with other reforms, it can provide the kind of changes needed to remove the inadequacies of the automobile reparations system without throwing out the system's proven values. ○

### History of Small Claims Arbitration in Pennsylvania

Philadelphia's widely discussed program for the automatic arbitration of small claims had its origin in Butler County in western Pennsylvania. Shortly after World War II, a backlog of 500 civil suits had accumulated there with only one judge to handle the load. This threw the docket more than three years behind. A pair of enterprising local attorneys decided to do something about the situation. Their research turned up an 1836 law allowing arbitration of civil suits if both parties agreed to it. This became the basis for a proposal for automatic arbitration of all civil cases under \$500. The plan was approved by the county commissioners and gratefully put into operation by the harried judge.

The first case to be arbitrated was an automobile damage suit which was disposed within one hour. Within two years, arbitration had wiped out Butler County's 500-case backlog.

In 1952, the Pennsylvania Legislature enacted a statute permitting the court of common pleas in each county to provide, by rule of court, for mandatory arbitration of cases involving no more than \$1,000 in claimed damages. In 1957, the statute was amended to include claims up to \$2,000 and to apply to the Municipal Court of Philadelphia as well as the common pleas courts. A recent amendment makes the procedure applicable to the County Court of Allegheny County (Pittsburgh).

<sup>1</sup> The reason for the variation in the number of findings and/or reports and awards listed herein and in exhibit I is due to the fact that some trial orders require more than one report and award by reason of garnishment, retrial, etc.

The following chart is an attempt to analyze the number of cases and the actual amounts in controversy in each of the 5,850 trial orders filed during 1964, the 6,450 trial orders filed during 1965, the 6,650 trial orders filed during 1966, and in the 6,800 trial orders filed during 1967.

	Number of cases filed in—					Number of cases filed in—			
	1964	1965	1966	1967		1964	1965	1966	1967
\$1 to \$100.....	119	75	85	56	\$1,001 to \$1,100.....	52	50	42	59
\$101 to \$200.....	352	337	326	321	\$1,101 to \$1,200.....	55	56	60	54
\$201 to \$300.....	353	343	376	371	\$1,201 to \$1,300.....	46	43	52	56
\$301 to \$400.....	291	246	306	306	\$1,301 to \$1,400.....	34	36	45	37
\$401 to \$500.....	236	244	256	304	\$1,401 to \$1,500.....	37	34	40	45
\$501 to \$600.....	175	192	206	185	\$1,501 to \$1,600.....	35	28	28	36
\$601 to \$700.....	126	120	149	151	\$1,601 to \$1,700.....	30	21	21	33
\$701 to \$800.....	105	108	115	141	\$1,701 to \$1,800.....	25	25	23	27
\$801 to \$900.....	86	75	96	102	\$1,801 to \$1,900.....	24	25	20	26
\$901 to \$1,000.....	84	114	109	93	\$1,901 to \$2,000.....	325	414	478	247

We also had filed with us in 1964, 3,260 cases which, lawyers stated, the amounts in controversy did not exceed \$2,000, in 1965, 3,864 cases in 1966, 3,817 and in 1967, 4,150 cases in the same category.

The trial orders in the last category, involving controversies not exceeding \$2,000, is rather difficult to analyze because under the Rules of Court a litigant does not necessarily have to indicate on the trial order the exact amount in controversy. In order to be subject to Compulsory Arbitration, all that has to be stated is that the amount in controversy does not exceed \$2,000.

## NUMBER OF DISPOSITIONS DURING 1966 AND 1967 IN EACH CORRESPONDING BRACKET (\$)

	1966	1967		1966	1967
\$1 to \$100.....	214	138	\$1,201 to \$1,300.....	63	74
\$101 to \$200.....	395	329	\$1,301 to \$1,400.....	43	50
\$201 to \$300.....	422	390	\$1,401 to \$1,500.....	39	71
\$301 to \$400.....	311	277	\$1,501 to \$1,600.....	24	28
\$401 to \$500.....	315	275	\$1,601 to \$1,700.....	29	25

K.....	14 $\frac{1}{3}$	43	6	570	540	-----	1,110
L.....	14	42	5	480	585	-----	1,065

The Philadelphia public definitely owes a great debt of gratitude to the Philadelphia lawyers, for without the help of these 2,500 lawyers in the area of trial by lawyer panels, the backlog might well be about ten years. The Honorable William A. Schnader, former Attorney General of Pennsylvania expressed it very clearly in his letter to our department on February 3, 1966 in which he said as follows: "I can't imagine what the situation of the Philadelphia courts would be if it were not for the operation of the Compulsory Arbitration Division of the County Court. Year after year your Division becomes more useful."

Considering the fact that during the past nine years, over 59,000 cases have been taken out of the courtrooms and referred to Compulsory Arbitration, makes it very obvious that the Court backlogs would have been intolerable without this method of trying cases. As we have said on numerous occasions, this could not have been accomplished with our current judicial manpower and limited courtroom facilities. Because of the limited number of judges and courtrooms, thousands of cases still have to wait their turn, and the ever present age-old law of supply and demand makes it impossible to cut the backlog in the cases over 2,000. On the other hand, in trial by lawyer panels, the process is reversed. Here we have 2,500 "judges" and 2,500 "courtrooms" constantly available for the trial of cases. Under such circumstances, the words "case on trial", have significance and, in addition, the litigants and their attorneys are convinced they have to take affirmative action and can no longer add to court congestion by delaying tactics. This, of course, results in final and speedy disposition of cases. We cannot overlook the fact that very often, planned delaying tactics are a significant factor in court congestion. Professor Robert G. Leh, of Gettysburg College, who recently made a study of Compulsory Arbitration (trial by lawyer panels) had this to say in his recent unpublished dissertation:

"Delay extends beyond the courthouse steps into law offices and litigants' homes and places of business. Its existence entwines with motives of man, personal and petty, great and general, spiritual and material. Therefore its cause cannot be simply laid to factors like too many cases, too few judges, and attractive forms. Within the period starting when a case trial-ordered languishes for any of a number of reasons, and ending when the judge's gavel falls at last in judgment, a device which filters out large numbers of cases from a congested civil docket for an exceptionally rapid and certain trial will have an administrative effect. This is compulsory arbitration's forte."

Compulsory Arbitration, or trial by lawyer panels, of course, becomes even more significant and more essential as community legal services are being increased, and as we move into the direction of more extended concepts of justice and increase considerably the amount of free legal service to the poor. The Federal Office of Economic Opportunity (OEO) has many more plans for free legal service to the indigent. By reason of this new concept, many more people are going to have a right, and will avail themselves more often to legal services in civil as well as in criminal cases. Because of this there has been and will be a greater increase in the amount of civil litigation. We also cannot overlook the fact that because of the ever increasing changes brought about by the current United States Supreme Court decisions, there have been additional in-

creasing demands in the criminal courtrooms and the tendency has been to shift the judicial manpower and courtroom facilities for the prosecution of criminal cases. This of course does not make the picture look too bright in the area of civil litigation.

It is interesting to note that the United States is not the only place that is having a problem with court congestion. A recent Associated Press Report stated that Italian Courts have 1.7 million cases awaiting action. An Italian State prosecutor who commented on the report predicted that it might take ten years for some of the cases to be handled. However, the fact that foreign countries have the same problem does not make the average United States citizen feel any better, nor does it improve our outlook for the immediate future. Recently, on July 29, 1966, it was reported in the issue of Time magazine that, "Court congestion is subverting United States justice. In many instances citizens are led to settle civil cases out of court for less than his due—or give up entirely." The only solution to this, of course, is more judges and more courtroom facilities, but in the foreseeable future as a practical solution, this can only be made possible by utilizing lawyer panels. In spite of this, there are some lawyers who are still opposed to the use of Compulsory Arbitration even in lower jurisdictional amounts. This, however, cannot be avoided in a society where freedom of expression is available to all of us and we must agree, of course, that this is the way it should be. The minority should also have a right to express itself.

We do not claim perfection for the idea of trial by lawyer panels. There are still some mountain tops to be reached. However, as Marvin Comisky, former Chancellor of the Philadelphia Bar Association once said, "It is pleasant every now and then when a plateau is reached, to pause for a view of the valley." It is at the end of every year, we believe, that we reach such a plateau and, therefore, let us now take a look at the accomplishments of trial by lawyer panels in 1966.

As in previous years, we operated under the guidance of a County Court Judiciary Committee consisting of the Honorable James L. Stern, sitting as Chairman, the Honorable Gregory G. Lagakos and the Honorable Clifford Scott Green. We were also directed by a Bar Association Committee consisting of fifty lawyers, with Joseph V. Restifo, Esquire, as Chairman, William H. Brown, III, Esquire as Vice-Chairman, Leonard M. Sagot, Esquire as Secretary and Joseph N. Bongiovanni, Esquire, Liaison to Board of Governors. As a result of the efforts of this committee, the status of Compulsory arbitration has been enhanced to the extent where we have our monthly statistical reports published regularly in *The Legal Intelligencer* and findings of panel members are likewise published daily in *The Intelligencer* on the same par with all of the dispositions in the Federal, State and County Court. Of this we are proud.

Trial by lawyer panels received a great deal of attention on April 27, 1966 in courtroom 453, City Hall, from 6:00 to 9:00 P.M., when we were given an opportunity to participate in Law Day observance and the public was given an opportunity to observe the actual trial of cases. Present during the entire evening in the audience was the Honorable Arlin M. Adams.

April 19, 1966, Comment by Supreme Court of Pennsylvania which appears in 421 Penna. Supreme Court Reporter, in middle of page 145 is also worthwhile noting.

On September 9, 1966, we were again placed in the spotlight during the Bench-Bar Conference in Atlantic City when a panel consisting of Judge James L. Stern, Sylvan M. Cohen, Esquire, and Commissioner Frank Zal, presented the topic, "Should the Jurisdiction of Compulsory Arbitration (trial by lawyer panels) be increased from \$2,000. to \$5,000.?" A full capacity turnout of lawyers attended this session.

We, of course, are still getting attention nationally. On October 13, 1966 we received the following letter from Stephen A. Millwid, Esquire, of the firm of Lord, Bissell & Brook in Chicago, Illinois:

"I am pleased to report that with the help of the information contained in the two articles that you furnished me, the affirmative on the question as to whether arbitration should be employed as a supplement in the trial of personal injury cases prevailed by a vote of two-to-one of all of those present at the debate that was held at the Chicago Bar Association on October 13, 1966. We are now hopeful that the Arbitration Committee of the Bar Association will make appropriate recommendations to the Board of Managers, who in turn would then request action by the Chief Judge of the Circuit Court of Cook County on this subject."

Just a few weeks ago we were informed by Ronald Miller, who is studying for his Ph.D. under Dr. George Taylor at the University of Pennsylvania, that he was making a study of the possibility of applying Compulsory Arbitration on a broader area—to extend to cases over \$5,000. and also into real estate. On December 12, 1966, the Board of Governors of the Philadelphia Bar Association, at its December meeting, voted to seek legislation which would increase the jurisdiction of Compulsory Arbitration from the present \$2,000. limit to \$3,500. The State Legislature, of course, would have to amend its statute which established the Compulsory Arbitration system. (C.P. Judges are asking increase to \$5000. See Resolution).

We are also very pleased to note that on December 20, 1966, Governor Scranton announced the appointment of the Honorable Samuel H. Rosenberg, one of our original panel members and who is still serving on panels, to be Judge of Philadelphia County Court, succeeding the late Judge Francis F. Burch. The Honorable Samuel H. Rosenberg served with distinction as a panel member and we know that he will establish a fine record as a Judge in the County Court.

Of course, our own President Judge of the County Court, the Honorable Adrian Bonnelly, during this past year as in previous years, has continued to herald the accomplishments of trial by lawyer panels in the County Court of Philadelphia, whenever and wherever he has been called upon to speak throughout the breadth and width of this great U.S.A.

In the area of appeals, we are grateful to note that with the removal of a number of marginal insurance companies, the number of appeals has definitely decreased. Our records also show that in 1964, Judges referred 198 cases to Compulsory Arbitration. In 1965, there were over 300 such referrals and in 1966 there were 531 referrals. A review of our statistics will also show that out of the 5,052 reports and awards filed during 1966, 1,790 cases were disposed of within 30 days after the cases were assigned to a panel; 2,140 within 30 to 60 days; 732 within 60 to 90 days, and the remaining 390 cases took 90 days or more. We also note that out of the aforementioned 5,052 cases, 4,401 were disposed of by original panels; 550 had to be reassigned to a second panel; 87 had to be reassigned to 2nd and 3rd panels; 13 had to be reassigned to 2nd, 3rd, and 4th panels; and one case had to be reassigned to a 2nd, 3rd, 4th, and 5th panel. Our records show that out of the 5,052 cases, 1,590 were referred to panels within FIVE MONTHS after filing of a trial order; 1,502 within SIX MONTHS; 590 within SEVEN MONTHS; 556 within EIGHT MONTHS; 764 within TWENTY-FOUR MONTHS, and 50 over 24 months.

It is again interesting to note that in 1966, in our 9th year of Compulsory Arbitration, we were still cleaning up "old suits", some of which had been started as far back as 1954, but had not been ordered down for trial until this year. This, of course, is still an improvement as compared to 1958, the beginning year of compulsory arbitration in Philadelphia, when some of the trial orders turned over to us went back to 1932.

In the area of court review, now that the problems and interpretations of the question as to "record costs" have finally been crystalized, the activities have been reduced to a minimum. However, we do wish to make known a reference to the case of Hawthorne vs. Penchiff, 40 D & C, 2d p. 43, which held that,

"An appeal from the award of a board of arbitrators will, on motion, be quashed as defective, where appellant failed to file the recognizances required by section 27 of the Act of June 16, 1836, P.L. 715, within 20 days after the date of the entry of the award; and in such case, appellant's petition for leave to file a recognizance nunc pro tunc will be denied.

We also note that in the case of Stewart vs. Masson, 40 D & C, 2d p. 401, it was held that,

"An appeal from an award of a board of arbitrators will, on plaintiff's petition, be dismissed as defective, where appellant, by reason of counsel's oversight, failed to file a recognizance, as required by section 27 of the Act of June 16, 1836, P.L. 715, as amended, within 20 days after the date of the entry of the award."

We should also like to make note of the case of Hammerman vs. Lee in the Superior Court of Pennsylvania No. 659, October 1965, which was an appeal from March, 1964, No. 7735 E. of the County Court of Philadelphia. And this again raised the question of what is meant by trial de novo when a case is appealed from Compulsory Arbitration.

We likewise wish to note that in the case of *Lane vs. Union National Bank of New Brighton*, 40 D & C, 2d, p. 411, it was held that,

"An action to quiet title, wherein plaintiff seeks to have a mortgage held by defendant decreed to be satisfied and discharged by reason of its payment, involves title to real estate, since the mortgage holds a security title; hence, the action is not within the jurisdiction of a board of arbitrators under the Act of June 16, 1836, P.L. 715, as added and amended, providing for arbitration of cases except those involving real estate."

Last but not least, we would like to take this opportunity to thank all of the various city departments, particularly the Prothonotary's office who has given us the utmost cooperation. Finally, of course, we also owe a debt of gratitude to our staff: Edward Deeney, Bernadette A. Hanna, Amos Volpe, Elwood Weiser and Regina D. Yannatella.

Respectfully submitted.

FRANK ZAL,  
*Commissioner, Compulsory Arbitration.*

(The following was referred to on p. 500:)

#### CONSUMERS INSURANCE INFORMATION BUREAU

To: State Association Executive Secretaries/Managers/Vice Presidents  
Local Boards Presidents/Secretaries  
State Advertising Chairmen.

GENTLEMEN: Here is your "Summer 1971—Information Kit" in support of the national campaign of the Consumers Insurance Information Bureau.

This kit contains the following items:

1. A guide: "How to Approach the Press."
2. "A Safety Effort": reprint of an editorial based on C.I.I.B. material.
3. Two stories on: (a) Drunk Driving; (b) Habitual Offender.

These have been drafted with spaces for the name of the local spokesman and association title.

4. Two suggested editorials: (a) In support of uniform traffic laws; (b) "One for the Road"—urging readers to demand stronger drunk driving laws.

5. Feature article—"Three Strikes and You're In."

6. Sample letter to the editor.

7. Sample script for short radio interview on highway safety.

8. A speech script: "A Start on Greater Highway Safety—George Will Do It" approximately 10 minutes, designed for civic, church and service groups.

9. Two Radio Public Service Spots: (a) 60 second—Constitutional right to life; (b) 30 second—Think before you drink.

10. Poster—"Safe Driving Is a Habit to Get Hooked On" originated by the Iowa Association. Order forms and return envelopes are also enclosed.

11. Booklet—"Alcohol Safety Countermeasure Program" produced by the National Highway Traffic Safety Administration of the Department of Transportation. It is included for your information on government programs involving drinking drivers. You may wish to determine if your community is participating in the "ASAP" program and, if so, how you can help.

A Review of this material will show that it is designed for local use and where feasible with local identification as to the association and agent. This is the grass roots approach which is most vital if our campaign is to achieve the results we all desire.

Further editors and radio station news directors, are constantly looking for usable material particularly when it has a local tie-in.

Please keep the Consumers Insurance Information Bureau alerted to the receptivity and use of material. Clippings from the local paper or tape recordings from radio stations are of considerable help in preparing future material. They show the Bureau what type of information is most likely to be accepted.

#### HOW TO APPROACH THE PRESS

1. Appoint one person as news contact or publicity chairman who would be responsible for placing this material and other with local news media. It would be helpful to name someone with previous experience in dealing with the press.

2. The publicity chairman should contact local editors and radio and television news directors asking for appointments to see them at their offices.

3. At their meeting the publicity chairman should outline the rationale for the campaign and its goals and ask for the support of the news media.

4. Show the editors the material and offer it to them and identify yourself as the news contact locally, providing them with office and home phone numbers.

5. Discuss with him Association plans for the campaign and suggest where the editor might find a logical local tie-in for news purposes. These might include speeches by Association officers; the continuation of a driver education program; a special highway safety promotion; a local Big "I" Day celebration; etc.

6. Don't be discouraged if you get an initially cool reception. News men are notorious skeptics and many may suspect this to be a disguised commercial venture.

7. Enlist the endorsement of public officials for the campaign. Chiefs of Police and Sheriffs will probably welcome your efforts—after all, if successful, their jobs will be easier. Ask if you can use their names in publicity.

8. Keep in mind photo potentials for the local paper.

9. Get from the editors their news deadlines. You have a better chance of having a story used if you get it in to the desk well in advance of the deadline.

10. Keep in mind upcoming events. The week preceding holidays and long weekends will probably be excellent times for highway safety material. The re-opening of school is another.

11. As for any sales presentation, do some homework. Have all material re-typed on association letterhead, double spaced, starting one-third down on first sheet. Delete suggested use and other directions in ( ) at top. When filling in space for names and association, do not underline. Segregate material according to media to be approached. You may see possibility of multiple placement for some material, editorials or short features. When using the same item twice, have it typed twice, don't use carbons.

(The editorial below appeared in the June 21, 1971 edition of the Wichita (Kansas) Eagle. It is based upon a story which was contained in the Spring Information Kit and is an example of the type of editorial support the press can offer to you in your community efforts.)

#### A SAFETY EFFORT

Call it enlightened self-interest if you will, but the Independent Insurance Agents of Wichita, in connection with the National Association of Independent Insurance Agents, is starting a campaign aimed at getting habitual traffic offenders barred from the highways.

That's not all the campaign includes in the way of improved traffic safety, but it's one of the most important points.

Figures that came out during the Wichita group's meeting here recently showed that only 4 to 12 per cent of the nation's drivers are "the culpable, the wanton, the depraved, the arrogant, the driver who is completely indifferent to the safety of others." These are the habitual offenders.

Of these, drunk drivers constitute the greatest percentage, the insurance men said, causing more than half the nation's 55,300 traffic deaths in 1970.

What the insurance groups are seeking are minimum criteria for habitual offender legislation and implementation of such laws in Kansas; strict enforcement of laws by local and state police; strict enforcement by the courts and jail sentences rather than fines for habitual offenders; periodic tests for health and vision, and the involvement of local civic clubs with the habitual offender problem.

They have put their finger on the main causes of accidents. Too many people who have caused serious accidents are merely given slaps on the wrist and released to go right back to their dangerous highway habits. Too many courts regard traffic violations as minors offenses, and because of their leniency, police see little use in being strict. Too many persons who are unfit for health reasons are driving cars. Remedy these situations and we'd all be safer on the road.

The insurance men are to be congratulated on their efforts. Other citizens should join them in their campaign.

(This article is one of two contained in this kit which were originally circulated through an editorial service. If they have not as yet appeared in your local publications, you might present either to the editor, inserting your association's name in the appropriate space.)

## ONE-TENTH OF ONE PERCENT MEANS YOU'RE DRUNK

One-tenth of one percent is miniscule in today's world of super-statistics and percentages but in at least one case it could be fatal.

According to the Consumers Insurance Information Bureau and the ----- Association of Insurance Agents, this is the blood-alcohol level at which the American Medical Association, the U.S. Department of Transportation, the National Safety Council, and the U.S. Public Health Service say a person has reached intoxication . . . he is drunk.

Yet, in many states the blood-alcohol level used for the purposes of testing and arresting a suspected drunk driver is 0.15 per cent, half again as high as medical and safety authorities have approved.

In 1970, over 55,000 people lost their lives in highway accidents. A compilation of research projects from different states indicates that alcohol was a factor in 60 per cent of the highway deaths studied. Sources from other studies say that alcohol played a role in anywhere from 50 to 87 percent of fatal accidents.

Citing other figures, the Consumers Insurance Information Bureau said nearly 5 million people were injured in traffic accidents last year. In all, there were 22 million such accidents which added up to an economic loss of better than \$16 billion.

The National Safety Council says: "If all the causes of highway accidents could be eliminated except one—50 per cent of the total problem would still have to be solved. The one major cause of all traffic fatalities involves drinking and driving."

The 150,000-member National Association of Insurance Agents is out to help the consumer. It is the sponsor of the Consumer Insurance Information Bureau through which it lends assistance to the individual independent agent in generating community support for strengthening weak traffic laws, having old laws updated and all laws enforced.

Laws relating to the menace of the drunk driver, particularly the blood-alcohol level limits, were established in most states based on recommendations made in the 1930's. They were established to protect the person who may have a higher tolerance to alcohol than most but times were then far different.

There were few 4,000-pound, high-powered vehicles compared to the numbers we see in every block today. Freeways, expressways and superhighways were still to be envisioned. The mobility of the 1970's was not foreseen. These are only a few of the demands for quick updating of 40-year-old standards.

The ultimate aim of the C.I.I.B. program is to eliminate the drunk driver and the habitual offender from the road.

Local independent agents are enlisting support from civic, service and church groups to reach the consumer. Consumers are being organized to insist on the passage and enforcement of modern traffic laws. C.I.I.B. is taking its impetus from Secretary of Transportation John A. Volpe, who encouraged such action at a forum on alcohol and driving when he said: "... you'll be lobbying for the most precious thing the Lord gave us . . . you'll be lobbying for life!"

(This article is one of two contained in this kit which were originally circulated through an editorial service. If they have not as yet appeared in your local publications, you might present either to the editor, inserting your association's name in the appropriate space.)

## HABITUAL OFFENDER MUST NOT HAVE A LICENSE TO KILL

Economic prosperity is often viewed in terms of housing starts and babies born but another view of the nation's affluence shows that there are more cars than homes or babies.

The automobile has brought tremendous benefits—but also unnecessary tragedy to the American scene, says ----- of ----- Statistics shows that last year the automobile was involved in 22 million accidents resulting in nearly 5 million injuries and more than 55,000 deaths.

Far too many of these accidents and too much of the highway carnage is caused by habitual offenders—those people who, because they were once issued a driver's license, now act as if they had a license to kill.

According to the Consumers Insurance Information Bureau, the habitual offender is the drunk driver, the reckless driver and the speeder or person who continues to drive even though his license has been suspended.

Getting the habitual offender off the road has become a key objective of the Consumers Insurance Information Bureau.

Sponsored by the 150,000-member National Association of Insurance Agents, the Bureau has launched a nationwide effort to arouse citizens to work to ban the habitual offender from the road.

The Bureau seeks:

The establishment of minimum criteria for habitual offender legislation in all 50 states.

Strict enforcement of laws by local and state police without fear or favor.

Strict court action including the imposition of jail sentences rather than fines on habitual offenders.

Instigation of periodic tests for driver health and vision.

Pointing to Virginia, where a Habitual Offender Law became effective in 1968, the Bureau notes that the highway death rate was reduced in just two years from 5.2 to 4.8 per 100,000 vehicle miles. If similar legislation were in effect in all states, many thousands of lives would be saved each year.

Drunken drivers are by far the largest group of habitual offenders, according to the C.I.I.B. Although it is unlawful in all 50 states for a person to operate a motor vehicle on a public highway while under the influence of intoxicating liquor, alcohol is a factor in nearly half of the highway deaths.

Recognizing that basic actions are necessary to alleviate the highway crisis, the National Association of Insurance Agents, through the C.I.I.B., is enlisting consumer safety groups and civic organizations to assist in its drive to make the highways safer for all citizens.

#### EDITORIAL—UNIFORM HIGHWAY CODE

The end of the school year has put millions of American families on the nation's highways in search of fun and adventure.

The adventure they find in crossing into another state by automobile may very well be lacking in fun, according to the Consumers Insurance Information Bureau. This is caused by the wide variance in traffic laws between states.

On speed limits, they range from "Reasonable and Prudent" in two states, to 50 to 75 mph, in the others. The nearly completed Interstate Highway System is Federally funded and built to Federal specifications, yet speed limits on the system vary from 65 to 75 mph from state to state.

The definition of drunk driving is more startling according to the Bureau, which is sponsored by its 150,000 member National Association of Insurance Agents. Nineteen states still use 0.15 percent blood-alcohol level for defining drunk driving, or have no statutory presumptive level at all. Fortunately, 31 states use laws presuming drunkenness at 0.10, or below, the level at which leading safety and medical authorities say a person is drunk.

Financial responsibility laws, auto insurance liability, vary just as widely. An unfortunate motorist having an accident in another state may find himself not meeting that state's law. He then would have to post a cash bond or face suspension of driving privileges in that state.

CIIB suggests national uniformity of all traffic laws. It says that with the mobility of our citizens today, we have a right to know what to expect of the law and be afforded protection of the law equally at home or on vacation.

We agree and recommend that at the next Conference of Governors, the 50 chief executives set the machinery in motion to develop such a uniform code.

#### EDITORIAL—ONE FOR THE ROAD

Let's have one for the road.

This one being a stiff law to get drunk drivers off our highways. The legislature will convene again in ——— but it's not too early to start impressing on our local representatives that the highway carnage caused by the drinking driver must be stopped and now!

The Consumers Insurance Information Bureau says that 50 per cent of all highway fatalities involve alcohol in some way. The Bureau, which is sponsored by the 150,000 member National Association of Insurance Agents, notes that in 1970, nearly 28,000 people lost their lives because some people drank too much then tried to drive.

The ideal solution is to identify these people before they get into their cars but the practical solution is for the state legislature to review all laws relating

to drinking and driving and bring them up to the needs of the 1970's and 1980's. Three steps which can be taken according to CIIB are:

1. Reduce the presumed blood-alcohol level below 0.10 per cent for establishing a driver as being drunk or impaired.
2. Empower all police agencies to make pre-arrest tests for drunkenness and establish a requirement for them being given in suspicious circumstances.
3. Establish mandatory license suspension and jail terms for convicted drunk drivers and permanent revocation of driving privileges and extended jail terms for repeaters.

We are not looking to fill our state's jails but we are looking for the threat of such severe penalties to be sufficient to produce more *thinking* and fewer *drinking* drivers.

If the safety and security of your family means as much to you as it does to us, then we recommend you immediately begin writing to your state legislator demanding that in the next session, this state bring its laws up to date and make sure they are enforced.

Let's work together to prevent these unconscionable accidents.

---

(Feature news story for placement in local papers. Insert local association name in blank.)

### THREE STRIKES AND YOU'RE IN—PRISON

#### TOUGH TRAFFIC LAWS AIM OF NEW CONSUMER CRUSADE

The judge looks down from the bench at the defendant as he completes his sentencing, "... you shall be confined to the state penitentiary for not less than one nor more than five years."

The crime for which the defendant has been found guilty is not burglary, embezzlement, assault or theft but that of being a hazardous driver. More correctly, under Virginia law, a "Habitual Offender". A driver who has been convicted on three or more occasions for drunk or impaired driving, manslaughter, driving after his license was revoked, hit and run, or a felony involving the use of a motor vehicle.

In addition, the defendant has been guilty of driving a vehicle after his license was revoked under provisions of the "Habitual Offender" act.

In Baton Rouge, La., a police officer may request a breath test of a suspected drunk driver before he places him under arrest. If the suspect refuses the test, he is liable to fines of \$200 and/or a jail sentence up to 60 days. The state legislature of Louisiana has since enacted a similar state law.

These tough laws have been enacted and others are following because in 1970 over 55,000 people were killed and nearly 5 million injured in motor vehicle accidents throughout the United States.

Taking the lead for modern traffic laws and their enforcement is the Consumers Insurance Information Bureau with an immediate target of getting the habitual offender and the drunk driver off the highway. It is organizing a national consumer campaign to demand action in all 50 states.

The Bureau is supported in its program by the National Association of Insurance Agents and the ----- Association of Insurance Agents. The Virginia Association of Insurance Agents was instrumental in the passage of that state's strict law.

According to the Bureau, alcohol is the primary cause of traffic fatalities. Quoting the National Safety Council, it says: "If all the causes of highway accidents could be eliminated except one—50 percent of the total problem would still have to be solved. The one major cause of all traffic fatalities involves drinking and driving."

In New York's Westchester County a study showed that in 83 single-vehicle fatal accidents, 49 per cent of the drivers had blood-alcohol levels in considerable excess of what medical authorities determine as constituting drunkenness. The U.S. Public Health Service asserts that drinking appears to play a role in from 50 to 87 per cent of fatal traffic accidents.

Aside from the tragedy of death and injury, there is another price being extracted. In 1970, there were 22 million vehicle accidents in the United States resulting in an economic loss of \$16 billion.

The Bureau estimates that there are 106 million drivers in the country but only 4 to 12 per cent are in the category of the reckless driver—habitual of-

fenders. It is the 88 to 96 per cent, conscientious drivers, who are paying the tab. As in many other areas of American Life today, the consumer is beginning to yell about the price and availability of auto insurance.

It is the cry of the consumer that the C.I.I.B. is looking to turn into action. Specifically, the national program has the following goals:

1. Insist on a minimum criteria for legislation in all 50 states.
2. Demand strict enforcement of laws by local and state police—without fear or favor.
3. Insist on strict enforcement of laws by the courts and urge courts to impose jail sentences rather than fines on habitual offenders.
4. Require periodic tests for health and vision.

The C.I.I.B. acknowledges that the task will not be easy. It cites that more than 20 years passed before 47 of our states enacted "Implied Consent" laws which provide that an arrested operator of a motor vehicle consents to chemical tests to determine alcoholic influence. If the driver does not consent he is liable to having his license suspended or revoked. Even today, the Bureau notes, the three remaining states have not enacted such laws.

Subsequent to the passage of the Virginia Habitual Offender law in 1968, New Hampshire, Rhode Island, Vermont and Maine have passed similar legislation. Laws are now pending in several other legislatures.

In the case of Virginia, since its law went into effect, more than 2,225 drivers have been certified as being habitual offenders and of the number 1,110 were convicted.

Under the Virginia law's ultimate provision, 20 drivers had been convicted of operating a vehicle after their licenses had been revoked . . . and all 20 are now serving prison terms of one to five years in the Virginia penitentiary.

Most importantly, in the first two years the habitual offender law was in effect, the death rate in Virginia dropped to 4.8 from 5.2 per 100 million vehicle miles.

On the problem of drunk driving alone, the Baton Rouge, La. Police Department reported that not only did the citizens of that city accept the law but there was a 300 per cent increase in arrests for driving while intoxicated with an actual conviction rate of those arrested above 50 per cent.

It is this type of "minimum" criteria which the Consumers Insurance Information Bureau is recommending as the basis for legislation in all states.

The consumer is being urged to write letters to newspapers, radio and television stations demanding editorial support for his "constitutional right to life" by getting habitual offenders off the highway.

The course of action to solve the problem already has support from no less than cabinet level. Secretary of Transportation John A. Volpe called upon citizens to become involved when he said at a forum on alcohol and driving:

"Be activists! Be tenacious! Be sincere! Never let go. Become a people's lobby for highway safety. Organize teams and put pressure on courts, police departments, attorneys general, governors and legislatures for stricter laws on drunken driving. Your insistence on action will ensure success. You'll be lobbying for the most precious thing the Lord gave us . . . you'll be lobbying for life!"

#### MODEL LETTER TO THE EDITOR

(This model letter to the editor is designed as a positive response to an editorial endorsing stricter driving regulations, action against drunk drivers or habitual offenders, etc. It has been used effectively. Space is provided for appropriate association name.)

Mr. -----  
 Editor—Editorial Page  
 Publication  
 Street  
 City, State, Zip

DEAR MR. -----: Your fine editorial "(title)" of (date) has been called to my attention by several of our independent agent members.

On behalf of the National Association of Insurance Agents with its 150,000 members coast-to-coast, and the (state) Association, compliments are certainly in order to both the (appropriate local organization) and yourselves for your efforts to do something about the convicted drunk drivers who simply ignore license revocations.

We believe that taking the habitual traffic offender off the road is a necessary first step in bringing about a return to highway safety and in helping to

solve the current difficult insurance situation. Furthermore, we are doing something about it.

The ----- Association, through the N.A.I.A. and the Consumers Insurance Information Bureau, is enlisting broad consumer support for a national program with the following specific goals:

- (1) Insist in minimum criteria for habitual offender legislation in all 50 states.
- (2) Demand strict enforcement of laws by local and state police—without fear or favor.
- (3) Urge courts to impose jail sentences rather than fines on habitual offenders.
- (4) Require periodic tests for driver health and vision.

A major forward step was taken in 1968 when Virginia enacted a habitual offender law. The Virginia law has resulted in over 1,100 drivers being convicted as habitual offenders. Twenty of these persons have subsequently been caught driving without licenses and are now serving time in the Virginia Penitentiary. Since the Virginia law went into effect, the death rate has dropped from 5.2 to 4.8 per 100-million vehicle miles, which compares with the national average of 5.5 deaths per 100-million miles.

If legislation similar to Virginia's was in effect in all states, tens of thousands of lives would be saved, and the current auto insurance difficulties would certainly be resolved.

Again, congratulations on your stand.

Sincerely,

\_\_\_\_\_  
*Local Association Official.*

The ----- Association, through the N.A.I.A. and the Consumers Insurance Information Bureau, is enlisting broad consumer support for a national program with the following specific goals:

- (1) Insist in minimum criteria for habitual offender legislation in all 50 states.
- (2) Demand strict enforcement of laws by local and state police—without fear or favor.
- (3) Urge courts to impose jail sentences rather than fines on habitual offenders.
- (4) Require periodic tests for driver health and vision.

A major forward step was taken in 1968 when Virginia enacted a habitual offender law. The Virginia law has resulted in over 1,100 drivers being convicted as habitual offenders. Twenty of these persons have subsequently been caught driving without licenses and are now serving time in the Virginia Penitentiary. Since the Virginia law went into effect, the death rate has dropped from 5.2 to 4.8 per 100-million vehicle miles, which compares with the national average of 5.5 deaths per 100-million miles.

If legislation similar to Virginia's was in effect in all states, tens of thousands of lives would be saved, and the current auto insurance difficulties would certainly be resolved.

Again, congratulations on your stand.

Sincerely,

\_\_\_\_\_  
*Local Association Official.*

Radio or Television Script for local station use. In person interview 8-10 min. This interview covers the subject of the drunk driver.

*Announcer:* This is ----- of station ----- And the program is -----

Today I'm speaking with ----- of the ----- Association of Independent Insurance Agents about one of the most important problems of the day—that of highway safety and the role of the habitual offending driver.

Mr. -----'s association is part of the 150,000 member National Association of Insurance Agents. This organization of independent insurance men is initiating, through the recently-formed Consumers Insurance Information Bureau, a campaign to get the habitual offending driver off the road and to improve highway safety for all of us.

Suppose we start at the beginning, Mr. -----, just who is the habitual offender?

*Agent:* Well, (*announcer*), we define the habitual offender as the drunken driver, the speed maniac, the hit-and-run driver, the careless motorist, the person behind the wheel without a driver's license. In short, he is the driver who is

continually disregarding the laws of the state in which he is operating his vehicle.

**Announcer:** Just how serious is the habitual offender problem in this country?

**Agent:** All evidence shows that approximately 90 per cent of the driving public stays well within the legal limits. The habitual offender is a part of only the remaining 10 per cent of the driving population. This small portion of the citizenry last year accounted for more than one-half of the 55,300 deaths occurring on our highways. These few drivers—who cause destruction far out of proportion to their number—are the ones the National Association of Insurance Agents is trying to remove from the road.

**Announcer:** Does any particular category of habitual offender stand out as a prime cause of highway accidents. I mean, who is the worst habitual offender?

**Agent:** Without any question, the drunken driver is the worst offender. And he is a primary target of the Consumers Insurance Information Bureau. Many states still have driving codes based on attitudes and situations existing in the 1930's and 1940's—laws which are woefully inadequate. A blood alcohol level of .10 percent is considered sufficient by the medical profession to justify calling a person drunk. The Bureau is striving to get all states to adopt the .10 percent figure in defining a drunk driver. Fortunately 31 states have already adopted this standard. Next, of course, is strict enforcement by police and the courts.

**Announcer:** What do you expect to accomplish? Just what can the individual citizen do?

**Agent:** Well, Mr. -----, the first step is primarily educational. We hope, through the Consumers Insurance Information Bureau, to acquaint the public with the offenses of the habitual offender . . . to increase awareness of the cause behind many of the deaths on our highways and then to make the public and the consumer into forcing legislation which will get the habitual offender off the road. With the support of the public, we hope to substantially reduce the deaths on the highway.

**Announcer:** Then the National Association of Insurance Agents is looking for legislative changes?

**Agent:** That's correct. We are seeking minimum criteria for habitual offender legislation in all 50 states. We are looking for a law similar to the Virginia law which was passed in June 1968. Under this law, the habitual offender is one who has been convicted three or more times of a major offense, or 12 or more times of lesser offenses, within a 10 year period. If a driver accumulates enough violations to make him a habitual offender, his driving license is revoked for life. And, if such a person is caught driving after his license has been revoked, he faces a mandatory 1-to-5 year penitentiary sentence which cannot be suspended.

**Announcer:** Is the law working in Virginia? For example, are habitual offenders going to jail and have fatalities been reduced?

**Agent:** They have indeed. In the two years following passage of the Virginia law, the highway death rate dropped from 5.2 to 4.8 per 100-million-vehicle-miles . . . compared with the U.S. average of 5.5. During that same period well over 2,000 drivers were certified as habitual offenders. And, of these, 20 are now serving terms after being convicted of driving after their license had been revoked. We believe the same sort of results can be accomplished on a nation-wide scale.

**Announcer:** What is the situation here in -----?

**Agent:** -- state -- law currently defines a drunk driver as one with a blood alcohol content of ----- per cent. (Latest figure should be readily available from local police or motor vehicle bureau.) As I noted before, the medical profession feels a person is drunk at the 0.10 level.

**Announcer:** What prompts the National Association of Insurance Agents to undertake such a massive task?

**Agent:** You're right, -----, it is a massive task—a tremendous undertaking. But we believe that the deaths on the highway must be stopped. And that they can only be stopped by going directly to their cause. Many people, as you know, are studying means of compensating the victims, but this will not *stop* the fatalities. Still others are seeking to improve the vehicle—to build a bumper able to withstand a 5 or 10 mile an hour crash, to add other safety features. But, we cannot ignore the fact that it is the individual at the root of the problem—that we cannot stop the accidents until we get tighter, tougher licensing laws, and tighter and tougher enforcement in the courts and give the maximum penalty to any habitual offender.

**Announcer:** Is it true that if traffic accidents are reduced, that the insurance companies will be able to reduce rates?

**Agent:** Certainly, the saving of human life is our primary goal. But it is also true that if we reduce the amount of money paid out by the insurance industry—which in 1970 alone was in excess of 16 billion dollars—it follows that insurance premiums will come down. But as long as the mayhem on the highway continues, as long as human life is lost, and as long as the costs of automobile repairs, medical care, hospitalization, and many other costs continue their inflationary trends . . . insurance rates can't very well be reduced. Thus, it is obvious that we want to try to stop the mayhem on the highway and thereby reduce the amount of money which the public must pay out for insurance.

**Announcer:** How soon could you see such a trend developing?

**Agent:** Well, -----, a target date is very hard to set and it will vary from area to area. First we need to have the improved loss experience on which to base the premium rates. This will take time, but it will come about. You've got to remember, however, that the insurance industry is continually facing increased costs of claims through inflation and that we've got to see enough of a decrease in accidents to offset these inflationary trends before we can reduce rates to the insurance buyer. Insurance rates don't develop in a vacuum, they are the result of a wide variety of factors.

**Announcer:** Which takes us back to the habitual offending driver?

**Agent:** That's right. In order to make any progress, we must start at the beginning . . . at the source of trouble. We in the (state) Association, the National Association of Insurance Agents and the Consumers Insurance Information Bureau hope that by alerting and arousing the public we can bring about a reduction in highway accidents, improve traffic safety for all our citizens and restore the old pleasures of driving.

(Suggested text for speech to Civic, Church and Service Organization—approximately 10 minutes)

#### A START TOWARD GREATER HIGHWAY SAFETY—GEORGE WILL DO IT

Some people say that an insurance man never stops selling and in a sense I'm not going to disappoint you good folks today.

What I would like to sell you in the next few minutes is an idea not insurance. The idea is keeping ourselves and our children alive and free from the fear of disaster on the highways.

That's a pretty strong statement, I know. The truth is though that with all the technology available to us today, we are facing disastrous circumstances every time we drive our cars.

One thing about the insurance business, we always have facts and figures available to us. I would like to review some sad ones for you but if you've heard or read them before, listen again.

In 1970 alone:

55,300 Americans were killed in highway accidents

Over 4,800,000 were injured in highway accidents

There were nearly 22 million highway accidents

They caused an economic loss of better than \$16 billion.

This, of course says nothing of the personal loss and tragedy of hundreds of thousands of families.

If these statistics sound rather remote, let's get them a little closer to home. Here in (state,) ----- people died in highway accidents last year and in (county or city), ----- of our neighbors were killed.

This is a somber theme for such a meeting as this but it is something we had better, as citizens, be prepared to face. I don't want you to think that there is nothing being done about it but I do want you to realize that we, collectively, can and must do something about it.

As an independent insurance agent, I am a member of the ----- Association of Insurance Agents and a member of the National Association as well. Obviously, we're pretty close to this situation as writers of auto insurance. And, we don't like what we see.

The National Association of Insurance Agents has initiated a program to make our highways safer for all of us. But there is a catch in the program. The catch is that we are going to have George do it. And the George is you—and me.

I don't think that anyone will argue that the statistics I cited previously are disgraceful. We pride ourselves on our technological expertise yet we still see highways being built which are contributing factors to the rate of destruction we experience every year. We still see cars being produced unable to withstand even minor bumps much less the serious head-ons we read about every day.

Of course, our technological expertise really is not of any value when we come to the primary cause of highway accidents and that is people. It's still people who drive the cars on the new highways and do stupid things, repeatedly, and who wind up in the hospitals and morgues.

Here is where you come in, George. Those responsible for laws and their enforcement tend to respond to the attitudes of the citizen. If the citizen is apparently lax and unconcerned, there is not likely to be an uproar among legislators to pass stronger laws. If the citizen does not seem too concerned about any but the most serious offenses then police and the courts will tend to be lenient.

The point being that if we are to improve highway safety here in ----- and across the country, the Georges of the country had better let the legislators, police and the courts know that this is what they want.

In specific terms, the habitual offender and the drunk driver must be swept from the roads. The habitual offender is the driver who has been guilty of multiple traffic offenses and may have even had his license suspended one or more times. The drunk driver, very often, is someone who has a drinking problem and may not realize it or he may be the fellow who, as many of us have done, enjoyed himself at a party a little too much.

Don't get me wrong, we insurance agents are not proposing that the jails of the country be filled with errant drivers, we want everyone to know that the laws governing operation of motor vehicles have been passed for good reason.

We want to see old laws updated, weak laws strengthened and all laws enforced.

We would also like to see jail sentences rather than fines being handed down in habitual offender cases. If the threat of severe punishment is present and known, motorists will think more clearly before they take unnecessary chances.

One of the saddest facts from 1970 is that of the 55,000 plus people killed in highway accidents, one-third of them were youngsters between the ages of 15 and 24. How do we equate this kind of loss with a lenient attitude toward so-called minor violations of law?

We don't think the country can afford to wait. In the past 10 years, over 500,000 people have been killed on the highways. Where do we draw the line?

Some municipalities and states are doing something now. In Chicago, the Cook County supervising judge of the traffic court, Raymond K. Berg, decided to call a halt. He initiated a crackdown on drunk drivers whereby those convicted get a seven day jail term and a full year's revocation of driving privileges. Effective? In the first quarter of this year there were 50 death registered but in 1970 there were 73. This is a reduction of 32 percent. The penalties don't seem so tough now, do they?

The State of Virginia passed a strong Habitual Offender law. A driver convicted of a combination of serious violations numbering three, is automatically referred to a court. If the record is accurate, the Court certifies him as a Habitual Offender which means a lifetime revocation of his license. He can petition the court after 10 years for re-instatement.

The kicker in the law is that anyone caught and convicted of driving after revocation under this law gets a one to five year sentence in the state penitentiary with no part of the sentence to be suspended. Over 20 habitual offenders are now serving such terms.

Once again, it sounds pretty harsh. But the State of Virginia has reduced its highway death rate to 4.8 per 100 million miles from 5.2. The national rate is still right around 5.5.

What I am saying is—Georges of the country unite—safe highways are your responsibility. Let's get started right here and let our public officials, our police and our courts know that the stupidity must stop and we're ready to help.

#### HIGHWAY SAFETY PUBLIC SERVICE RADIO SPOT

(60 Seconds)

Our constitution states clearly that all of us have the right to life, liberty and the pursuit of happiness. Watch out, however, there are those around us who would permanently deny us our life and liberty in their pursuit of pleasure.

These tyrants are the nation's drunk drivers—there were over 28,000 people denied their constitutional right to life last year by drunk drivers. There were over 2 and one-half million other people denied their liberty, some permanently, resulting from injuries caused by these same drunk drivers.

The Consumers Insurance Information Bureau points out enforcement of drunk driver laws is too lenient. We must make the threat of severe punishment so strong that those who might drink and then drive will *think* before they *drink*.

Only you can insure continuation of your family's constitutional right to life. Demand in writing that your municipal and state authorities begin now to get this menace off our roads. It's your life—protect it.

This public service announcement was brought to you by the -----  
Association of Insurance Agents and radio station -----

#### HIGHWAY SAFETY PUBLIC SERVICE RADIO SPOT

(30 Seconds)

Think before you drink.

In 1970, too many people did not and over 28,000 persons died in traffic accidents where alcohol was a direct contributing factor. The Consumers Insurance Information Bureau says that in 1971 another 28,000 people, or more, will die on our highways due to drunk driving.

We cannot afford this senseless waste of life. You *can* do something. Write to your local and state authorities today, demand strong enforcement of laws to rid the roads of drunk drivers.

It's your life, protect it.

#### SAFE DRIVING IS A HABIT TO GET HOOKED ON

Poster is now available from the Independent Insurance Agents of Iowa.

Uses for poster—Distribute to all secondary schools; Work in cooperation with state safety departments for state-wide distribution; General distribution to communities: All local agents can display.

Guidelines for quantities—In Iowa we distributed 5,000.

#### Prices:

1,000	-----	\$142. 50
3,000	-----	228. 00
5,000	-----	346. 00
10,000	-----	594. 00

For imprint of your individual state or local name on orders of 3,000 or more, please add \$18.00. If imprint is not ordered, only the "Big I" emblem will appear on the lower portion of poster.

NOTE.—The enclosed sample is exact size, color and paper weight as those that will be shipped to you. If you have a special size, use, or quantity for which you would like a price quotation, please write: "Big I" Posters—P. O. Box 279, Des Moines, Iowa 50301.

# SAFE DRIVING IS A HABIT TO GET HOOKED ON!

Independent Insurance Agents of Iowa

# **The Alcohol Safety Countermeasures Program**

**Spearheading the  
national effort to get  
problem drinkers off  
America's highways and  
to keep them off  
until their problem  
is alleviated**

**NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION  
U. S. Department of Transportation  
Revised, April 1971**

# The Problem

Nearly everybody has been aware since the automobile was invented that the use of alcohol by its driver is a major threat to life and limb on the highway. Slogans have underscored this dangerous combination (drinking-driving) — "If you drive, don't drink," "Gasoline and alcohol don't mix," "Make the One for the Road Coffee," and numerous others. But until publication of the "1968 Alcohol and Highway Safety Report" by the U.S. Department of Transportation, and its presentation to Congress, relatively few persons were really aware of the magnitude of alcohol-related highway casualties.

The report, which summarizes studies using the best scientific investigative techniques — including blood alcohol concentration tests, extensive research, and detailed analyses of police records — showed that the use of alcohol by drivers on the highways, particularly the continued, excessive use of alcohol by *problem drinkers*, is the single most important highway safety issue today.

The report also showed that alcohol involvement by drivers and pedestrians is responsible for more deaths on the highway than any other single factor. It disclosed, as a matter of fact, that drinking drivers and pedestrians contribute directly to about half of all traffic deaths and injuries.

The report further revealed, contrary to long-held popular opinion, that most of those deaths were not primarily the result of actions by what is commonly known as the "social drinker," but by the driver who drinks to great excess. It is emphasized in the report that in most of the alcohol-related traffic deaths, consumption had been to an excess seldom attained by the general driving public. This information was verified by highway spot checks and by extensive police and clinical investigations of blood alcohol levels of highway victims.

# What Are Problem Drinkers?

Problem drinkers are those who have more than one arrest for offenses involving alcohol—including non-highway arrests, who are known to the various health and social agencies in their communities, and who often have a history of troubled relationships with their employers, their families and their banks or creditors.

Most significant of all, they are the kind of drinkers, who, when checked at the time of their highway crash or arrest, had been drinking very heavily as indicated by their blood alcohol levels. Their blood alcohol concentration is 50 to 100 percent higher than the .10 percent level which the National Highway Traffic Safety Administration has set as indicating intoxication. Blood alcohol concentration refers to the amount of alcohol in a person's bloodstream. It is the commonly used scientific method of laboratory analysis to determine whether or not a person is drunk.

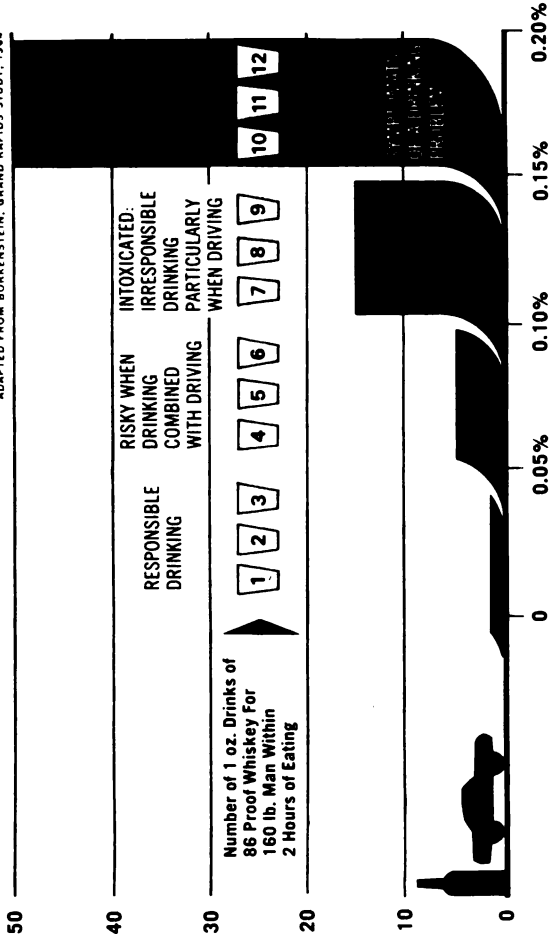

It is an extremely accurate method and can easily be given with the help of standard breath testing equipment available in most police stations.

The Federal standard on alcohol, which is part of the Federal Government's effort to improve highway safety, and which all states are directed to adopt, establishes that a blood alcohol concentration of .10 percent is legal evidence of drunkenness. This standard for drivers also calls for uniform "implied consent" laws which legally give police the right to check suspected drivers' blood alcohol concentrations. Even .10 percent blood alcohol concentration is considered too high by most authorities. A person with .10 percent concentration is almost seven times more likely to have a vehicle collision or to become a pedestrian casualty than a non-drinker. A

# Drinking and Highway Safety

## Relative Risk of Crash

ADAPTED FROM BORKENSTEIN, GRAND RAPIDS STUDY, 1964

Blood Alcohol Concentration

person with a .15 percent (B.A.C.) is 25 times more likely to have a collision than an abstainer. Medical authorities and exhaustive research have demonstrated that a person with this high blood alcohol concentration is totally incapable, physically and mentally, of driving a motor vehicle.

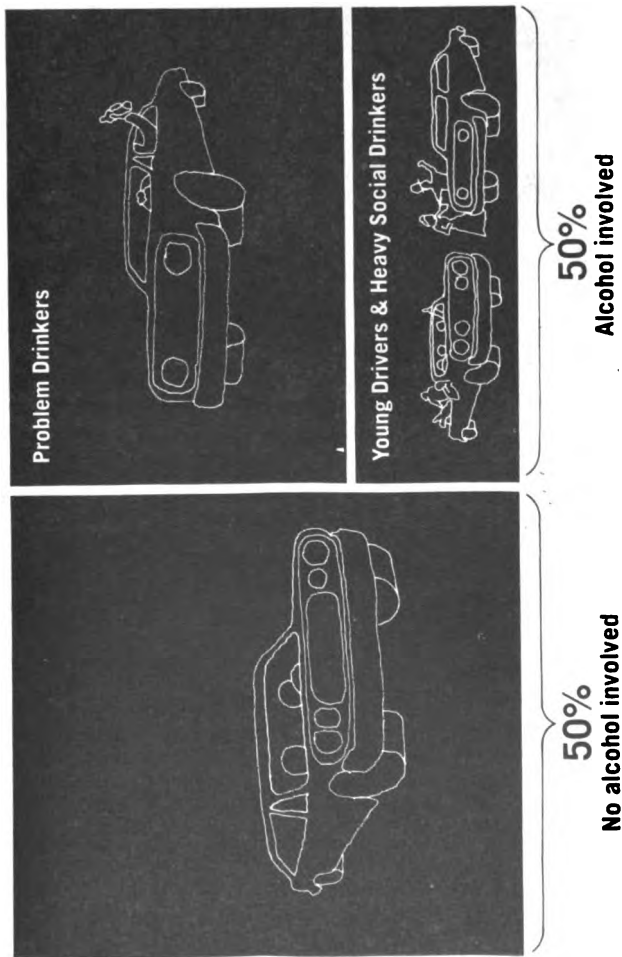

To reach a concentration of .15 percent, for example, within two hours after eating, a 160 pound man would have to drink ten, one-ounce drinks of .86 proof whiskey all to be consumed in one hour. The same drinker would reach the same state of intoxication with one-third less quantity, if taken on an empty stomach. Larger drinks hasten the process. That's a lot of drinking. Think about it. It is clearly a level of drinking way above the "social drinker class," and is, in itself, indicative of a drinking problem.

The 1968 report to Congress disclosed that it is excessive drinking, particularly by individuals with drinking problems, which causes the majority of the traffic deaths in which alcohol is involved. This report, on which the NHTSA's high priority Alcohol Safety Countermeasures Program is based, is available from the U. S. Government Printing Office, Washington, D. C.

Total highway deaths in the United States have been rising every year. In 1969, an all time high figure of 56,400 highway deaths was reported by the National Safety Council. Thus, our annual highway fatality rate is approaching, and during the 70's will probably pass 60,000 a year. Alcohol will play a role in 50 percent or about 30,000 of these

## Alcohol and Responsibility for Fatal Accidents

**1969 = 56,400 Traffic Deaths:**

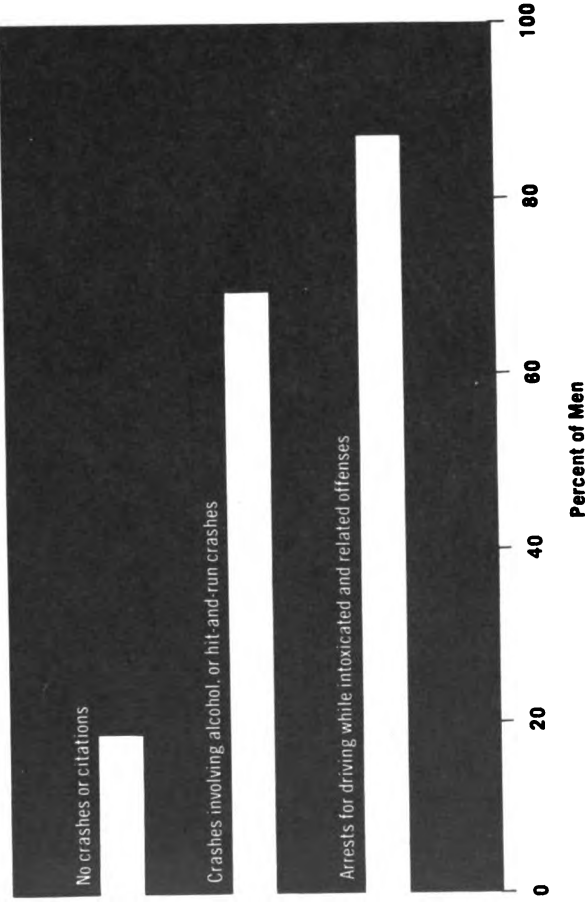

fatalities. Of these 30,000, an estimated two-thirds or 20,000 will be deaths involving problem drinker drivers or pedestrians who will kill themselves, their passengers and other innocent men, women and children as a result of driving after drinking excessively. The other third of the alcohol related accidents will involve social drinkers, particularly heavy social drinkers driving after a spree and young drivers who are learning both to drink and to drive.

Safety experts use the term "problem drinker" to describe about two-thirds of the drinking drivers and pedestrians who cause fatalities on the highway, not only because blood tests give evidence that their consumption of alcohol is far beyond normal levels, but, in addition, because research indicates that they have experienced problems with alcohol in the past. Studies of backgrounds of drinking drivers responsible for fatal crashes show that as many as two-thirds have had a problem with alcohol before, as indicated by a previous arrest, hospitalization or a social agency contact in which excessive drinking played a role. Thus, many of the drivers responsible for fatal collisions give evidence of both abusive use of alcohol and prior problem drinking.

Experts disagree in their estimates of the number of problem drinkers who drive, but most would agree that at least seven percent of drivers have a drinking problem. Seven percent of the total driving population of 108 million means there are about seven million-plus problem drinkers on the highways today who are the primary hazard in terms of

## Percentage of Men Known to Police Department and/or to Community Service Agencies Prior to Arrest or Crash Involvement

ADAPTED FROM WALLER, JAMA, 1967

alcohol-related deaths and serious injuries. That's about one driver out of every 15. Something ought to be done about *highway killer problem drinkers*, don't you think? Something is!

A combination of growing public awareness, scientific research, and improved laws is being applied to the control of the problem drinker, and headway is being made. The door is wide open for a full-scale attack on this Number 1 highway safety hazard.

The Administration's Alcohol Safety Countermeasures Program is the Federal Government's response to pleas from concerned citizens to do something about highway fatalities caused by problem drinkers; to get them off the highways, and to keep them off because they are medically sick.

It's a tough program, a program with teeth in it, but one that can work, given the cooperation of state and local community organizations. It takes into full consideration the schools of medical and social thought that have established the need of medical treatment for problem drinkers. It also regards the untreated problem drinker as a menace to society, when he gets behind the wheel of a car.

Logically, the problem drinker should no more be allowed free and uncontrolled access to the wheel of a car on a highway than a potential killer should be allowed to carry a concealed and loaded pistol.

# Three Important Measures

The Alcohol Safety Countermeasures Program strikes at the problem drinker with a three-pronged attack which, when effectively implemented by the states and local communities will reduce the death and injury toll on the Nation's highways due to alcohol.

The major measures are:

- Identification of the problem drinker. He must be separated from the great mass of social drinkers. He must be singled out, not just on the highways, even with innovative methods such as the use of video tape recorders and breath testing equipment, but through court records and the resources of social and health agencies, insurance companies, and other organizations. The program calls for setting up procedures under which these records and other relevant information from police files and driver licensing agencies can be exchanged on problem drinkers and their accident involvement. It also encourages social agencies to provide information to driver licensing officials and the courts concerning the identity of problem drinkers, with appropriate safeguards of the physician-patient relationship.

Consider: If records of court convictions for alcohol-involved offenses are readily available

to driver licensing officials, they can easily determine whether or not a person should be permitted to drive. Also, if the cooperation of social and health agencies which provide services to problem drinkers is obtained, special driver retraining and driver assistance programs can be made available to the problem drinkers.

- Decision on courses of action. The decision to take the most appropriate means to make sure a convicted drunken driver doesn't get on the highway again after drinking will be made by the courts and driver licensing officials, who will reach their conclusions on a presentencing investigation after the individual's guilt is determined.

Through this investigation, those who are responsible for decision making can determine whether or not the person is a problem drinker, and, if so, what rehabilitation procedures or action on his future driving should be taken. They can work closely with medical examiners who will provide driver license applicants a hearing when there is data indicating a drinking problem. After medical examination of the individual, they will be prepared to make a fair judgment. Actions that can be taken include revoking the accused's driver's permit,

- Action to assure a follow-up to carry out the decisions concerning the most appropriate procedures to reduce the drinking-driving problem, and to assure that drivers who drink excessively do not operate a vehicle on the highways.

None of these countermeasures will be effectively implemented automatically, easily, or without objection. Effective implementation requires technical knowledge and considerable expenditure of public funds.

In all cases the cooperation, interest and strong support by the local community, its citizens, its safety organizations, and its governmental agencies are a prerequisite to the adoption of alcohol safety countermeasures, and for the saving of thousands of American lives in years to come.

securing his cooperation in undergoing treatment for alcoholism, and limiting, but not revoking his driving privilege. This would permit him to drive, but not drink and drive.

If the action decided upon is to help the problem drinker to overcome his excessive drinking weakness, his cooperation must be gained to submit to medical treatment. If this course is accepted, the physician may prescribe a safe drug to help him to resist alcohol consumption.

For economic and physical reasons, the action taken may be to limit or revoke the abusive drinker's license to drive. It is possible that some leniency may be extended regarding the offender's disciplined drinking, but never to be followed by his personal driving. Generally, if the individual accepts a responsibility to abstain from alcohol, driver re-education programs will be made available and he may be restricted to driving to and from work during daylight hours.

# How It's Being Implemented

The Alcohol Safety Countermeasures Program is being activated as quickly as possible in states and communities which demonstrate that they are prepared to combat the problem of alcohol abuse by the drinking driver. The program is partially implemented by:

- Tangible support for state and community safety programs through matching ("fifty-fifty") grants prescribed by the Highway Safety Act of 1966. Funds available under Section 402 of this Act of Congress assist states in upgrading their highway safety programs in accordance with uniform Federal standards. It's going to take time, training of competent personnel, and the development of facilities to achieve the objective of maintaining rigid control of drivers with drinking problems.

- Research and development programs to generate improved, more effective countermeasures for community use. Basic research that clearly demonstrated the relationship of excessive drinking to soaring highway fatalities

was produced in the decade of the 1960's. This provided a basis for the introduction of more intensive countermeasures which will be improved as testing provides wider knowledge through practical application in the states and local communities.

- A public education campaign on alcohol and highway safety which points out the dimension of the alcohol safety program, and which distinguishes between social and problem drinkers. The public needs to be made aware of the magnitude of the problem and the fact that, while any drinking before driving is discouraged, direct aim is being concentrated upon an isolated group of medically sick people, not the public at large. Society has wrestled with this problem of drinking and driving for more than three generations. The countermeasures program's success depends upon concentrated, comprehensive effort aimed at the problem-drinker driver. This is based upon broad public and official support at the local community level.

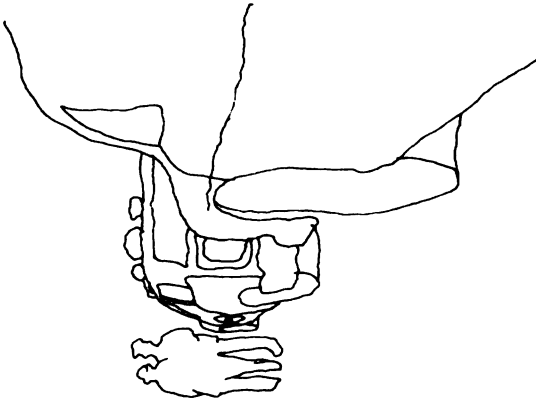

- Alcohol Safety Action Programs (A.S.A.P.) These model, community level demonstration projects for three years will be one hundred percent Federally funded to provide evidence at the community level of the feasibility of the countermeasures concept. Then the shift will be to state financial assistance on a matching arrangement. The demonstration projects also will test specific countermeasures, provide an opportunity to evaluate their effectiveness, and most important of all, begin to save lives. These programs are designed to show one of the principal ways alcohol safety countermeasures may be effectively implemented.

The A.S.A.P. efforts relate to ten basic areas. Many of the individual countermeasures to be employed are experimental and innovative. They have to be tested in the field before there are sufficient, valid data to support further application nationwide and meeting highway safety program standards.

The ten basic objectives are:

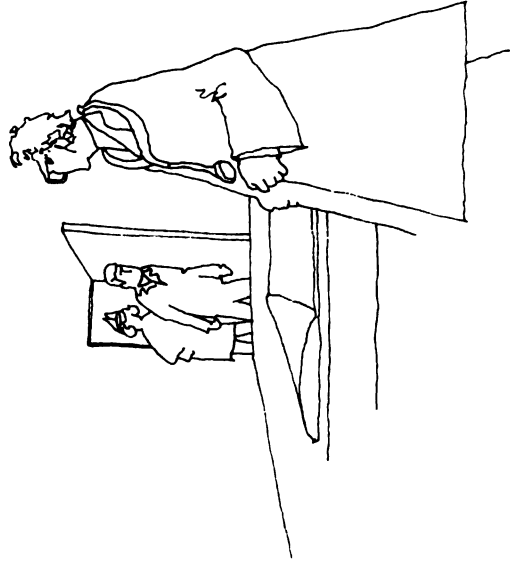

1. Official support—the initial step for a community undertaking an Alcohol Safety Action Program encourages the support of all the agencies involved in carrying out countermeasures activity.
2. Public support—the initiation of an educational campaign to gain widespread public acceptance is essential to augment official support.
3. Identification of Problem Drinker-Drivers—before they get on the road while intoxicated. The most practical method is by improving record systems so that convictions for alcohol-involved, non-traffic arrests appear on the driving record, together with records of treatment by public social and health agencies.
4. Enforcement—problem drinkers for whom no record exists must be apprehended through more intensive enforcement at the times and places where a drunk-driving offense occurs. There also must be more adequate enforcement against driving with revoked or suspended licenses.
5. Court action—following apprehension and conviction, a pre-sentence investigation should be instituted to insure objective sentencing; referral to treatment for those who need it; the use of preventive drugs under medical supervision where indicated.

6. Required Treatment—just as industrial organizations motivate employees identified as problem drinkers to take treatment under warning of dismissal, so the courts may induce convicted problem-drinking-drivers to take treatment as a prerequisite for reinstatement of their driver's license. If this option is to be available to the courts, communities must provide expanded treatment facilities. The Alcohol Safety Countermeasures Program administrators work closely with the National Institute of Mental Health, the Public Health Service, the Veterans Administration and others in the mental health area, to insure that combined efforts "dovetail" in the interest of rehabilitation of those who need it.

9. **Driver Training – Driver improvement** programs operated by the courts and motor vehicle departments provide a favorable opportunity to reach problem-drinking-drivers. All too frequently, drunk-driving charges are modified to “reckless driving” or a lesser charge, and the guilty wind up in driver improvement courses rather than with a license suspension. Such courses emphasize the general aspects of driving. What’s needed is the development of special

8. **Driver Assistance – Research** indicates that problem drinkers who have their license revoked frequently continue to drive. Enforcement efforts must be intensified, but the pressure to drive can be relieved by providing the restricted individual with assistance in finding a car pool. Crisis intervention, providing a “hot line” for the individual heavy drinker to call for help from voluntary groups when his driving impairment is alcohol caused, also may reduce illegal driving. Driver assistance is a vital rehabilitation aid.

7. **Licensing Actions –** by authorities generally empowered to levy or revoke driver licenses of those unfit to operate a vehicle because of disabling illness, physical limitation or dependence upon alcohol. This disciplined use of authority must be made effective under legal safeguards. Medical review boards should determine eligibility for a driver license of every individual who shows evidence that he has a drinking problem.

indoctrination within these courses tailored for drivers with a drinking problem. Further attention is recommended for devoting greater emphasis to drinking-driving countermeasures in public and commercial school driver education programs and the relationship of alcohol's role in highway fatalities and injuries.

10. Program Evaluation – A key feature of all A.S.A.P. projects will be the surveying of experience gained from application of objectives. Provision for adequate data collection and interpretation of findings is essential if we are to determine what works and what does not.

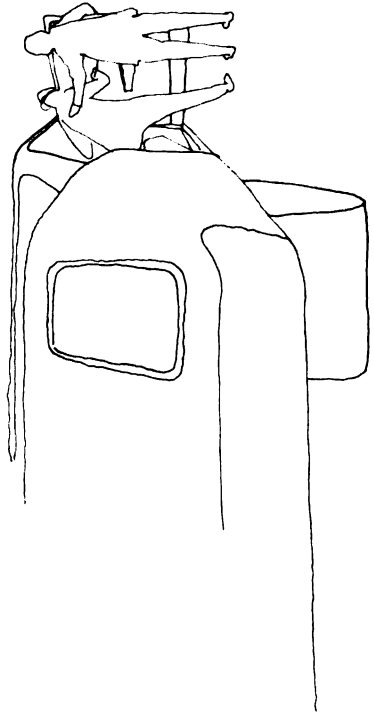

Nine A.S.A.P. initial demonstration projects were selected in widely diverse communities across the Nation. The locations were chosen on the basis of preparedness to demonstrate that lives can be saved through comprehensive support and cooperative action within the respective local communities.

Additional project applications are being studied in anticipation of funds approved by Congress, and it is contemplated that within coming months at least one demonstration project will be activated in each state.

With U. S. vehicle mileage estimates by the Administration projected to reach 1-trillion, 392 billion by 1980, countermeasures against those who drink to excess and drive must be twice as effective even to hold to present high level figures. To reduce our death rate even by half will require us to quadruple our present efforts!

Equally shocking are disabling injuries – future number incalculable – which recently were approximately two million annually – one in every 100 Americans injured every year.

Will this number increase? Yes, unless each driver makes safety his full-time obligation when using our highways.

# **AUTOMOBILE INSURANCE REFORM AND COST SAVINGS**

**WEDNESDAY, MAY 5, 1971**

**U.S. SENATE,  
COMMITTEE ON COMMERCE,  
Washington, D.C.**

The committee met, pursuant to recess, at 10:10 a.m. in room 5110, New Senate Office Building, Senator Hart presiding.

Present: Senators Hart and Cook.

Senator HART. The committee will be in order. I am delighted, and I wish more of my colleagues were here, to welcome one who has been a good personal friend and a very able trade union leader in this country, the international vice president of the United Auto Workers, Mr. Pat Greathouse.

We will order your statement printed in full in the record and, as you go along, if there are any comments you wish to add, please feel free to do so.

## **STATEMENT OF PAT GREATHOUSE, VICE PRESIDENT, UNITED AUTOMOBILE, AEROSPACE & AGRICULTURAL IMPLEMENT WORK- ERS OF AMERICA (UAW); ACCOMPANIED BY JACK BEIDLER, LEGISLATIVE DIRECTOR**

Mr. GREATHOUSE. I am Pat Greathouse, vice president of the United Auto Workers. I am here to express our union's strong support for a national system of no-fault auto insurance.

The shortcomings of the present costly and unreliable system of auto insurance are familiar. To the average factory worker and his family, the uncertain and expensive outlays for auto insurance present a most serious budget problem.

Last week President Leonard Woodcock of the UAW told the Moss subcommittee in the House of our support for H.R. 7514, and I am here before this Senate committee this week to reaffirm our position on the pending legislation for no-fault auto insurance.

The case for no-fault auto insurance is not complicated. A few facts gleaned from the Department of Transportation's studies seem to sum up the overriding need for legislation.

1. Legal fees totaling \$600 million were paid out in 1968 amounting to 20 percent of the total income of the legal profession—just for litigation arising from auto accidents in that single year.

2. Auto insurance companies, meanwhile, repaid only one-fifth of the \$5 billion in compensable losses resulting from deaths and serious injuries caused by accidents in 1967.

3. Victims with losses greater than \$25,000 recovered only one-quarter of their loss.

4. Those with losses of less than \$500 got back four times the amount in insurance settlements.

Plainly, these circumstances call for reform.

Let me mention what this litigation does to our courts. In Wayne County, Mich., where our union headquarters is located and with which I am most familiar, 40 percent of the court litigation is concerned with auto accidents. Yet, in spite or because of this, in Wayne County a claimant must wait 4 years before his case even comes to trial. It is estimated by DOT that 17 percent of our present litigation is centered around auto accidents.

The unfairness of the present system is also illustrated by the person whose rates are raised and whose policy is canceled without notice and with no reason given. Sometimes these are impoverished people, sometimes they are the elderly, sometimes it is the young.

A system of no-fault auto insurance—setting up a national insurance system—would prevent these arbitrary actions from happening and would set up a standard premium rate for all—rich and poor, young and old.

A study by the insurance industry showed that claimants with a permanent total disability had an average total economic loss of \$78,000 but received settlements averaging \$12,556—only 16 percent of their loss. Obviously, the present system fails in this instance.

In Michigan where I live the premiums for auto liability insurance have increased 115 percent since 1962. Take-home pay for nonsupervisory and factory workers has gone up only 50 percent while nationally the auto insurance rates have climbed by 65 percent from July 1960 to July 1970. There is thus a built-in deficiency to our present system.

Aside from the unfairness of the present system, we must also look at the impact of this economic misuse of resources as it affects the whole economy.

In 1968, for instance, only \$6.6 billion was paid to claimants while \$11 billion was paid in premiums. Only 42 percent of all the money paid in premiums is paid back in benefits. How much better for families and the economy if this administrative overhead could be spent as high velocity consumer dollars for items to raise family living standards.

The no-fault concept is not new. It is working now and working well in the province of Saskatchewan, Canada. The British, for 50 years, have had a limited no-fault system. There is no indication, incidentally either in Saskatchewan or the United Kingdom, that no-fault has in any way encouraged reckless driving. But it has meant substantial savings to consumers.

The premium rates paid by British motorists are dramatically lower than in the United States. Mr. George J. Stewart, chairman of the Insurance Marketing Group, reports that when you compare premium costs for comprehensive insurance for cars in three equal price and power ranges you find the following:

The United States: Cadillac (urban), \$861 to \$1,107; Cadillac (suburban), \$353 to \$486; Chevrolet (urban), \$558 to \$767; Chevrolet (suburban), \$245 to \$357; Ford (urban), \$590 to \$767; and Ford (suburban), \$245 to \$357.

Britain: Jaguar (urban), \$240 to \$331; Jaguar (suburban), \$132 to \$208; Austin (urban), \$135 to \$175; Austin (suburban), \$72 to \$94; Rover (urban), \$214; and Rover (suburban), \$113.

As we see it, the no-fault system would provide a prompt method of reimbursement following an auto accident. We favor a system of national health insurance which would provide complete hospital and medical protection for all. The no-fault insurance would then mainly provide reimbursement for loss of income up to, in our opinion, \$36,000. The reimbursement would be immediate, not long months and years after an accident. Beyond that point we favor the right of a person to sue for negligence or pain and suffering.

We favor Senator Hart's bill which permits unions to bargain for no-fault auto insurance and we favor legislation which legalizes group auto insurance. We also favor a \$36,000 pay-out level which is in Representative Moss' bill instead of the \$30,000 limit in Senator Hart's bill.

We are not in favor of turning this over to the States. That path is too slow, too uncertain, and too full of pitfalls. It is better to pass no national legislation than to turn this back to the States. We don't drive in States. It would never happen; there would be too many delays and deficiencies in the final outcome if we go the State-by-State route.

From what we know, we are certain that national standards, a national regulating system, is inevitable. So we say: "Do not tinker with the problem by throwing it back into the laps of the States. Take care of the problem at the Federal level."

Let me sum up again our position. We ask for an end to the costly, unfair, and unreliable system of fault auto insurance and call upon the Congress to legislate a national system of no-fault auto insurance. We see this as a way to greatly reduce insurance costs to the consumer. We see it as a sure way to reimburse injured persons immediately for nearly the full loss of income.

We also favor the retention of the right of injured persons to sue for negligence, also pain and suffering beyond a limit of \$36,000.

We oppose letting the States do this and we are asking instead for Congress to set up Federal standards and Federal regulations. The savings in both money and heartache are almost beyond calculation.

There is scarcely a group in the Nation today which is not hurt by the present clumsy method of auto insurance. There are no standards, there are no rules—there are only glaring deficiencies. Billions of dollars of consumer money is poured into an unfair system.

Even Blue Cross and Blue Shield, for all their deficiencies, do pay back 95 percent of their premium money into actual benefits.

Cancellations and rising premium costs, while they hurt the poor the most, also hurt the more affluent members of society. Those who are neither poor nor affluent are robbed of income they need for life's essentials which now goes into the pockets of insurance companies and lawyers because the system requires it.

Senator Magnuson, one of the coauthors of the legislation we support here, has noted that American motorists pay \$14 billion annually for auto insurance and receive only \$7 billion in benefits, while some \$11 billion in economic losses must be covered by the \$7 billion. Consumers are getting back only 50 cents on every dollar they spend.

Besides its unfairness, we regard the present system as a great source of economic waste. The automobile is a necessity to every family. We in the UAW have campaigned for built-in safety features and, while we favor all the highway safety features advocated by the conventional safety movement, we also recognize that built-in engineering safety features must be part of the total equation which makes for safe driving.

With 85 million passenger vehicles on the road today accidents are inevitable. There is no good reason why injured people must wait months and months, hire expensive lawyers and get back a fraction of their economic loss.

The no-fault auto insurance approach puts an end to these inequities and will give millions of American auto drivers the kind of equitable treatment they have a right to expect. We do not say this is a cure-all, but we think it will help. Every legal right of the insured motorist is protected under the system we are proposing, but he may no longer be fair game for a game of legal cat and mouse.

Mr. Chairman, we support this legislation and certainly hope that it is passed by the Congress.

Senator HART. Mr. Greathouse, thank you for your testimony and for the support which you voice on behalf of your union for the proposal.

One recurring theme in that testimony I sense, is that you believe that the adoption of the no-fault program would enable us to put our auto insurance premium dollars to better use?

Mr. GREATHOUSE. That is correct. There is no question in my mind that with the need for additional safety in automobiles, the costs that will entail, that certainly we need to have a savings on the automobile insurance, both because it will give better coverage and quicker service and also allow us the additional premiums we are now paying to be used for something else.

Senator HART. One of the basic themes of those who do not share the point of view that you just voiced is that no-fault plans sort of take money from the innocent and give it to the guilty. Did you, in reaching the conclusion that you did, consider that aspect of the debate?

Mr. GREATHOUSE. We considered this, but we don't really think in the innocents and guilty that there are many people who deliberately are guilty of causing accidents. It may be people who are assessed to be at fault, but in many instances this is a happening that takes place at which there is not a deliberate fault or a deliberate guilt and, therefore, we think it is more important that the insurance company insure and pay the people rather than argue about who is responsible for the accident.

Senator HART. And as so often happens, if you are found to be 5 percent at fault, your recovery is zero.

Mr. GREATHOUSE. We have also found out in experience in a number of instances there is a trade-off by the insurance companies when in many instances, because of a deductible policy, it will claim that each one is responsible for their own damage at the present time.

Senator HART. I have said that I have never been conscious in my driving nor am I aware of any friend of mine who is conscious that he ought to stay within the speed limit or be prudent at the stop sign

because of the insurance policy problem. There is a deterrent if you have a scout car at the corner, but not the insurance matter.

Mr. GREATHOUSE. I think the only deterrent at the present time is a number of people having accidents are afraid to report damage to their insurance company for fear they will be canceled or for fear that their rates will again go up.

I think the survey is not really accurate because there are many accidents that are not reported for this simple reason, because the individual would rather pay the expense than take a chance on having his insurance canceled.

Senator HART. I will not belabor it, but over this weekend I had a reminder very close to my home that that does happen with greater frequency than most of us realize.

Very shortly after you began, Mr. Greathouse, we were joined by the very able Senator from Kentucky, Mr. Cook.

Mr. Greathouse is a fine constituent of mine.

Senator COOK. It is nice to see you, sir. I am sorry I am late. I found myself in a meeting I could almost not get out of.

I take it from what you have said here, and I have read it now, that really you are calling for a combination of no-fault and the ability of the individual to acquire insurance above the provisions that would be required under a national no-fault program; is that correct?

Mr. GREATHOUSE. That is correct.

Senator COOK. Because I notice you do favor the retention of the right of injured persons to sue for negligence and pain and suffering beyond the limit of the Moss bill in the House which is \$36,000.

Mr. GREATHOUSE. That is right.

Senator COOK. So we are talking about a combination of both, are we not?

Mr. GREATHOUSE. That is right.

Senator COOK. We are talking about a basic no-fault and the ability of the insured to acquire additional insurance, over and above that provided under a no-fault program, in the event that he may find himself sued in the courts for negligence and pain and suffering?

Mr. GREATHOUSE. That is correct. In addition to that, we are also in support of legislation providing for auto insurance as a part of collective bargaining and for group auto insurance.

Senator COOK. I hope I say this and do not get too big a smile out of my Chairman—I try not to get into too many arguments with too many people—but I notice that you say that Blue Cross on a national average pays out 95 cents on every dollar. You also added the phrase "For all their deficiencies."

Now, you wouldn't really figure that even any Federal program that we would establish on a no-fault basis could do much better than 95 cents out of every dollar paid to the claimants, do you?

Mr. GREATHOUSE. We are not talking about the 5 percent being part of the deficiencies. They have deficiencies other than administration.

Senator COOK. I know they have tremendous deficiencies in the State of Michigan because I have been studying Blue Cross-Blue Shield's program throughout the United States, and I think the program in the State of Michigan is about as recalcitrant in its ability to effectively and efficiently pay claims as almost any other State in the Union. But

I would hope that you wouldn't mean that as a carte blanche indictment of all Blue Cross-Blue Shield programs throughout other States.

Mr. GREATHOUSE. We think there are deficiencies in the program, but the deficiencies we are talking about are not in the retention for administration.

Senator COOK. Thank you, Mr. Greathouse. Nice to have you here.

Thank you, Mr. Chairman.

Senator HART. The Federal Government is the patsy—I agree with my colleague—but you know we don't do badly in retention as far as social security is concerned, and I do not want to debate either.

Senator COOK. I do not think we do if you really want to know the truth. If we can get the accurate figures out of social security I would be happy, but we cannot ever get accurate figures out.

I know they take longer to pay a claim under social security as in the State of Michigan they take to pay a claim under Blue Cross-Blue Shield, which is 20 months.

Mr. GREATHOUSE. They both do better than the auto insurance companies.

Senator COOK. I cannot argue with that.

Senator HART. Thank you very much.

Now other good things; two gentlemen whom I have met on occasion in connection with the development of this legislation and other matters, the president of the American Trial Lawyers Association, Mr. Richard Marcus, and Mr. Craig Spangenberg, chairman of the Auto Reparations Committee.

Mr. Spangenberg is a graduate of a very distinguished law school and a very distinguished alumnus of that school.

**STATEMENT OF RICHARD MARKUS, PRESIDENT, AMERICAN TRIAL LAWYERS ASSOCIATION; ACCOMPANIED BY CRAIG SPANGENBERG, CHAIRMAN, AUTO REPARATIONS COMMITTEE**

Mr. MARKUS. Mr. Chairman, if we may, we would like to have our prepared statement accepted for the record, and then we would like to summarize it orally if we may.

Senator HART. We would welcome that. The testimony will be printed in full.

Mr. MARKUS. Mr. Spangenberg will make our initial comments and I would like to make some supplemental comments.

Mr. SPANGENBERG. I speak here today, Senators, on behalf of the American Trial Lawyers Association which comprises about 25,000 lawyers whose chief interest is in representing the plaintiff.

Senator HART. May I interrupt just as we begin, to introduce Senator Moss of Utah?

Senator MOSS. I am sorry to be a little late.

Mr. SPANGENBERG. I want you to know that what we say has that built-in bias or self-interest, that we speak for the injured man in the same way that one who speaks for the insurance industry has a built-in bias, too.

I would like to start with a simple hypothetical case. A driver is on the open highway, on the right side of the road and at an appropriate speed. Approaching another driver on the wrong side of the road

comes to a curve and tries to pass, can't make it, and a head-on collision results.

This same kind of accident happens at intersections where a driver runs a stop sign or a stop light, or where there are rear end collisions, though the most serious injuries are likely to come from head-on collisions.

We will assume that both drivers are seriously injured, hospitalized, disabled for weeks or months, and consider what ought to be done for them in a perfect world. I think a very strong argument can be made that society as a whole has an interest in seeing to it that both drivers should receive full medical care, should be patched up and rehabilitated and retrained as best they can be with modern medicine, and a strong argument can also be made that an injured man and his family and dependents should not suffer deprivation or hardship due to income loss during the time they are disabled.

Most countries in the world have looked at this same problem, and I would say every major nation in the free world, has decided that this social interest in rehabilitating victims demands that they receive a kind of social insurance.

In every major nation in the free world the driver who is injured will receive full medical treatment and will receive some disability payments, enough for a living wage while he is disabled. This has nothing whatever to do with automobilers, this is part of a broad, general social approach to the problem, because the same arguments for the automobile victim apply with equal force to a man who breaks his leg falling off a ladder hanging strips, or to the recreational skier who breaks his leg on the slope, or to the housewife who falls down the stairs and breaks a leg.

There is nothing particular about automobile accidents that requires any different social treatment than any other kind of accident. So we see in all other nations there is a broad national health insurance program for all kinds of accident victims which the American Trial Lawyers Association thoroughly endorses, supports, and we think would make almost meaningless much of the Hart bill if we could get it here.

All other nations have disability insurance, but these are also State funded. I notice the previous speaker spoke about Great Britain with which I am quite familiar, and there is national health insurance, national disability insurance. So the fact the driver gets patched up doesn't mean he gets it patched up by automobile insurance. He gets patched up by other means.

The difference that we see is that all other nations in the free world have a concern for the man who is innocent and who is right, and as to the man who is in the right they say he is entitled to full compensation, not half pay or three-quarter pay but full pay.

So, in Great Britain, the driver who is right gets full compensation. He retains his traditional right to sue under the tort system of Great Britain, and he will find that the other driver carries insurance with no upper limits at all, because Great Britain doesn't believe in 10-20's or 15-30's there.

If you are insured there, you are insured without limit at fairly modest premiums, a high coverage not costing very much. Again the same is true all over the world.

In most of these countries the liability insurer on the car is required to reimburse the State for its medical pay and its disability pay or for some part of it. But the key is that they distinguish between the man who is right and the man who is wrong. The man who is wrong gets full economic restitution, but the man who is right gets complete restitution.

The deficiency we see in the Hart bill is that it gives absolutely no compensation to the completely innocent victim, the right-side-of-the-road driver, the man stopped at the stop sign. And in at least 99½ percent of all cases, you provide in the catastrophe insurance that the man will have a tort suit, but you say he will have it only if he suffers permanent disability of at least 70 percent.

I am not sure you realize what 70 percent permanent disability means, but there are well-established tables for this, validated by the American Medical Association and State compensation insurance commissioners.

And you should realize that being totally blind in one eye or losing one eye is not 70-percent disability, nor is total loss of hearing, nor amputation of one arm at the shoulder, or one leg at the hip, or both feet below the knees. Seventy percent permanent disability, which you provide for, would apply to less than three-tenths of 1 percent, so far as we can read the tables of all accident victims. And you are saying to the rest of them it doesn't matter what your loss is, you will not be paid.

Now, I do not think the American public will sit quietly by and say we will forgo our right to pain and suffering.

There are questionnaires that say they will, but pain and suffering to the average man means a physical sensation of pain. And when you turn that around and say if you are totally deaf for life, if you have one eyeball ripped out, if you have an arm amputated or a leg gone or if your spine is totally fused, all these things which are not 70-percent disability, do you think you ought to be paid for that loss? And here the public opinion polls, I address you now as political people, of course, indicate that the great majority of the American people think that the innocent victim ought to be paid for his disability if not for the physical sensation of pain.

The DOT public attitude policy done by the University of Michigan started out with a question "Are you satisfied or dissatisfied with the present system?" which includes all the deficiencies of the way the insurance industry runs the system, of course, and about 2 to 1 of the public said we are satisfied.

Now, of those who were dissatisfied, questions were put "What don't you like about it?" Forty-four percent said high cost and about 25 percent complained about ratings, cancellations, nonrenewals—2 percent said they didn't like the fault system which doesn't mean there is a great ground swell of public opinion to support the no-fault concept.

Against the idea that there may be some magic in no-fault, let me make it clear that the American Trial Lawyers Association and so far as I know all other lawyers associations, do not oppose the no-fault concept in the sense that they are opposed to a kind of insurance which pays its benefits regardless of the guilt or innocence, right or wrong or fault of the person who suffers loss.

Such insurance is commonplace today. All life insurance is, of course, no-fault insurance, and most of us carry that. In the automobile field, collision insurance and comprehensive insurance on the automobile is strictly no-fault, first-party insurance.

I know that people say if we just adopt that kind of insurance, great things will happen, but let me point out to the committee that collision insurance rates in this country have risen faster than personal injury liability insurance rates which gives no promise that no-fault by itself cuts costs.

In addition, this committee, early in its consideration of the joint resolution, heard a great deal of testimony from people who complained bitterly that they got their policies canceled because they had two side-swipe accidents in 1 year when the car was parked in public places, which means that if you have a collision insurance claim you are very likely to run into cancellation or at the least a rate surcharge for 3 years.

Again, this is typical first-party, non-fault insurance. So, it does not mean that adopting first-party, no-fault insurance makes the insurance industry behave in a better way than it has behaved up to now.

Senator HART. Mr. Spangenberg, at least you would agree that the Hart-Magnuson bill prevents cancellation and obligates them to write it?

Mr. SPANGENBERG. Yes. We are for that.

Senator HART. You are?

Mr. SPANGENBERG. We are for that. On your group sales, we are for that. If you can cut costs with group selling, fine. Any way you can cut costs is good. We would suggest a better way to cut costs on personal injury. I am sure this committee knows that the personal injury liability rate is no more than a third of the insurance premium the average driver pays.

The last time I spoke was in Arizona, so I looked up Arizona rates, and at Flagstaff, if you have the typical coverage on an automobile, personal injury liability was 16 percent of the total premium.

In Phoenix it was 28 percent. So, if you are shown figures—here are the usual insurance rates in the United States—you must understand that most of the rates you are looking at is the no-fault kind of rate, the collision and comprehensive.

Most of the money goes for sheet metal and glass, not for people. So, we do not think the Hart bill has addressed itself to two-thirds of the cost problem. The solution to that two-thirds is in the bumper bills, is in the standards for repairable automobiles with which we are all interested. And on the personal injury side the American Trial Lawyers Association has recommended to Congress that when you pass a Federal safety standard saying that a car must have a seat belt, then you should at the same time pass legislation saying drivers must wear seat belts, because the best orthopedic surgeons and the best safety men in this country insist that if all drivers used all the safety devices that are mandated to be put in the automobile, there should be no injury at collision speeds of 20 miles per hour or less and the total injury picture should be reduced in this country by 50 percent.

Again, in the same way a good bumper will reduce your collision cost, so the use of safety devices should reduce the cost of injuries by reducing the injuries themselves.

U. C. RESEARCH LIBRARY

I would like to close with one comment about what I consider an over-kill in the Hart bill. You have provided very large benefits on the disability side, and there is argument this will take a lot of cases out of court. Well, if that is your motive, I would like to point out that the Department of Transportation study showed that you can take a lot of cases out of court if your economic benefit repayment is only \$500.

Two-thirds of all claimants have economic losses of less than \$500. Indeed, when you come down to economic loss, pain and suffering and everything else, at what level are half of all claims for personal injury paid by all insurance companies in the United States, what is the half figure? Again less than \$500 pays 56 percent of all personal injury claims in the United States. So, when you get up to benefits of \$30,000 wages plus unlimited medical, you know, \$50,000 and \$60,000 of benefits in serious cases, anything left over that is about two-tenths of one percent, we figure.

The number of cases that would be removed from the system with very modest payments of medical and economic loss we think would cure the ills of congestion, though to cure congestion we have got to have a no-fault felony bill, too.

If you can just say there is no penalty for stealing less than \$5,000 and no penalty for any assault less than murder, we can release perhaps half our judges that are now on the criminal side over to the civil side. I don't say I advocate it.

I am making the point that most court congestion is caused by the criminal dockets in the United States, and there are many studies to prove that. Again court congestion is not really a reason to destroy the rights of innocent people.

What we see in the Hart bill is not a change of the insurance system but rather a violent and revolutionary change in the rights of individual people to be treated as individuals and to have their losses fully paid on those occasions when they are completely in the right.

May I turn the microphone now over to Mr. Markus?

Mr. MARKUS. Senator Hart, as has been already suggested by Mr. Spangenberg, our position is substantially that this bill does not go far enough in providing no-fault protection and goes much too far in providing no payment protection.

In other words, this bill, as it is now drafted, is an attempt to protect the economic loss of a relatively small fragment of the population who are entitled to protection in a way which frankly we think will be a bonanza to the insurance industry.

We think, as it is now drafted, this legislation can and will be the bounty at the end of the rainbow for every insurer in the United States. We must tell the committee of our concern of this nature.

Senator HART. You ought to tell them first. Maybe we can get some support for the bill out of them.

Mr. MARKUS. Since you say that, maybe we should make it clear, I don't think the insurers are opposed to this concept. To be very candid, they are in favor of getting this concept at the State level where they have greater control over the State legislatures and the State insurance commissioners.

They are afraid of anything with the word "Federal" in it, and they are afraid that there is a real problem with the word "Federal" in it.

As far as the profitability, I think most of them can see from the Massachusetts experience that this is a bonanza.

Let me, if I may, consider the material that is contained on pages 12 and thereafter in our prepared statement and talk to you about some specific problems we think exist with the present legislation.

Mr. Spangenberg has already described our problems with section 2(9), which is the definition given to catastrophic harm, and I suggest to the chairman and to the committee that, if they would refer to such standard texts as the Journal of the American Medical Association cited by us, the U.S. Bureau of Labor Statistics, cited by us, and other standard texts in this field, I think they, too, would be shocked to find what the standard of 70-percent permanent partial disability means.

It is such a totally grievous loss that it would be, I think, far beyond what the committee contemplates. I think it is also interesting to note that what was an ambiguity in the former language of the act has been resolved but in a direction that I could never have anticipated.

The former language indicated that if there was economic loss beyond that which was provided by the policy prescribed in the statute, it was unclear whether that would be recoverable in a tort action. The present language leaves no question whatever, that if there is an economic loss by the innocent victim of money out of his pocket which is not compensated for out of this first party protection, he will not receive repayment of that in a tort remedy unless he can show this 70-percent permanent partial disability as well.

And I think also, with all respect, that is shocking.

Turning then to the definition that is used for disfigurement, it describes disfigurement as compensable if there is permanent severe and irreparable disfigurement. Those of us who have had occasion to work with claimants who have had serious disfigurement and who have seen them go through 20 to 30 surgical operations cannot help but wonder whether they will be deprived of any compensation, if at the end of this whole picture of misery and anguish it is said by some court that the condition is no longer—after all of this—irreparable, that it is no longer severely disfiguring.

Section 8(10) (C) talks about economic loss and describes what types of economic loss will be reimbursable.

Again I think that the committee may not have thought of some of these considerations and I offer them in a genuine effort to be helpful. The provision is that 85 percent of the economic loss will be reimbursed, that is 85 percent of the wage loss will be reimbursed. I presume that this is suggested on the theory that 15 percent represents income taxes that are not to be paid and are not charged against this sum.

As a practical matter, an ordinary person who has a wife and three children, taking the standard deduction, is not obliged to pay 15 percent of his total income as Federal income tax unless he earns at least \$18,000 a year.

So, for the overwhelming majority of the population, and particularly for the lower income groups, this is a drastic reduction. People whose every penny is a determination of whether they will have something to eat at the next meal will have that penny and that meal taken away under this provision, though they were totally innocent.

There is no payment, no provision for payment that extends beyond 30 months in the bill that Senator Hart has presented or in the 36 months in the bill that Congressman Moss has presented.

I point out to you that though this may sound like it covers every situation, because almost no people, certainly a very, very small percentage of the people, have wage loss that extends beyond those periods of time, the fact of the matter is, however, that the language as it is now written means that if there is disability that extends after that period of time, there is no compensation for it.

I suggest we think about the situation in which a man is injured, returns to work after a period of 6 months, and 2 years later is required to have extensive hospitalization and disability; he will receive nothing for his later lost wages under those circumstances.

Again I think this is not what the committee intends.

In this respect and in regard to the payment for permanent partial disability, this bill provides much less protection than any workman's compensation statute in the United States to the best of our knowledge.

Perhaps the most disturbing part of the language with reference to economic loss, however, is the use of a standard for measuring the wage loss as the date of the injury and as the income at that date.

In other words, whatever income the person is earning at the time of injury is his frozen rate under the language as I read it in the statute now. This means that the fellow who is between jobs, that the student, that the housewife, would presumably receive no compensation whatever for their lost earning capacity, that future earning which they would most likely have obtained, under the present language of the bill.

As it is presently drafted, the bill describes that there will be payment of the first party benefits as excess above other public and private insurance plans, but then provides that this isn't necessarily so if these other plans expressly state that the auto insurance described here will be primary and the other plans will be excess. I suggest to the committee these very significant meanings.

First, during the interval in which the policy prescribed by this statute rides on top of other insurance, we will have an illusory cost-savings simply by shifting the cost to another area. That cost saving will disappear fairly soon, because the other policies will find out and push it back onto auto insurance.

That is not very hard with this language. Indeed with this language, they could except themselves from coverage where there is an accident involving an automobile. But during that interval, people will be in effect paying double coverage. They will be paying for both types of coverage and they will be receiving only one.

Though we recognize the problems in double coverage, they are certainly not as disturbing as having people pay for both, so the insurer can receive double profit, and pay only one back.

I think the other problem that is lurking beneath the surface relates to the national health insurance industry. We have every reason to believe that the health insurance industry is going to be quite anxious to say that this automobile insurance, this junior national health insurance bill, if you will, will be primary, and that the national health insurance payment, if any, will be secondary and above it, so that they can hold on to their share of profits for this part of the market.

I want you to recognize what is here so that we don't do this blindly, if that is not what is really intended.

We also know that the overwhelming preponderance of economic loss is medical expense, and we think that there is serious doubt as to the need or wisdom for legislation of this type if there is a comprehensive national health insurance program. We do recognize that this still leaves wage losses as something which should be taken care of, and we are proposing in every State legislature that will give us an ear that there be temporary disability insurance laws similar to those that now exist in California, New Jersey, New York, and elsewhere.

I think, finally, the only other two comments that I would like to make with reference to the specific language are first that you have made the liability insurance that you provide optional. You have also prohibited any State from requiring liability insurance either by compulsory insurance or financial responsible laws.

As a practical matter, this means that your payment for even catastrophic harm will be illusory in most cases since there will be no compulsion of any kind whatever to force people to carry any liability insurance against that.

I suggest that you should consider the wisdom of making that coverage mandatory as well as the other coverage.

Finally, I wish to bring to your attention I think a really serious problem, and that is the last thing I discussed. Much discussion has been given by the populous about the poverty areas of our communities. Right now, we know that poverty areas have serious problems with automobile insurance. It is my firm belief that this legislation will increase those problems manifold. Typically the poverty areas contain people who are avoiding buying automobile insurance of any kind even in compulsory insurance States where they are required to do so by law. They don't have the money to buy the insurance so they find any method they can to drive that car without the insurance.

I am not pleased with that situation, but at least I can recognize it. This law will mean that they have no first-party protection and they have no third-party protection. They have no protection at all.

Now, although I can feel some concern that these are people who are violating the law, I have much less antagonism to the people who are violating the law because they are forced to by economic necessity than for the wealthy man who is in a hurry and has to go through a red light and who is given special consideration by this legislation.

Senator HART. What if he is a smoker and I am not a smoker, why is it consistent to support national health to pay the man who inflicts his own damage and yet raise such hell about the rich man going through the lights?

Mr. MARKUS. Because that is supported by a general tax funding. That is not supported by saying only the healthy people—

Senator HART. It sure comes out of my taxes. If I am a nonsmoker—I don't want to put Kentucky on edge—

Mr. MARKUS. If you give me the opportunity, I think I can explain why it is compelling and I think your example is an excellent one. As a nonsmoker and a smoker you are each contributing equally toward the potential risk of many, many diseases and injuries. As a motorist who is the one at fault, you are receiving benefits that you do not now receive and as one who is not at fault, you are giving up the benefits in order to pay for them.

Senator HART. One is a private health insurance program, the other is a national health program. You call no-fault in your prepared testimony a victim tax, but Federal taxation that covers smokers with funds from nonsmokers is all right.

Mr. MARKUS. That is a general tax. One is progressive—

Senator HART. It is money from the nonsmoker and not money from the safe driver?

Mr. MARKUS. The safe driver will contribute along with everybody else equally, not lose an overwhelming preponderance of his present benefits. Under the present system, liability system, he receives about \$30 for every dollar he pays into automobile liability insurance as the average payment out of—

Senator HART. But if it is a health program, the chances are that those fellows are giving more.

Mr. MARKUS. I don't understand, Senator.

Senator HART. Conceivably it would be based on a progressive tax structure.

Mr. MARKUS. I don't know, but I assume it will be a progressive tax structure, yes.

Senator HART. I assume that the wealthy nonsmoker will make more than the smoker.

Mr. SPANGENBERG. We may be in agreement.

Certainly we would have no objection to a national health program, nor national disability program, and the State disability programs that pay out to bad drivers their medical and their disability, and, of course, everyone would support the payment to bad drivers, good and bad.

Senator HART. Maybe we are hung-up on the use of some pretty emotionally charged labels.

Mr. MARKUS. Like no-fault.

Mr. SPANGENBERG. This is because of the broad social interest in rehabilitating victims, including foolish men like myself who smoke, although my doctor tells me if I didn't I might go crackers and psychiatric care costs much more than any other kind of care.

Senator HART. If you don't cross with the light, you may get hit on the curb anyway.

Mr. SPANGENBERG. Yes. Understand, we are not opposing no-fault benefits as such. I do seriously question, Senator Hart—I think our statement is consistent with that—I seriously—

Senator HART. Then don't call it a victim-like tax.

Mr. SPANGENBERG. The victim tax is when you say in order to keep the premium down we will not let the innocent victim recover full compensation. That is the tax. To the extent that you diminish the right to full compensation—

Senator HART. But there aren't any intangible benefits provided in a national health care program either.

Mr. SPANGENBERG. Certainly not.

Mr. MARKUS. It is not what it is for.

Mr. SPANGENBERG. My argument was based on West Germany, Sweden, Norway, Spain, Great Britain, Ontario, Saskatchewan—these I know about because I had the privilege recently of chairing an international symposium in Spain on auto reparations—everyone says we pay health care, we pay disability to every accident victim, but we pay

it out of a State fund because we have found it is much cheaper to do that way than through compulsory private insurance. In the same way we pay social security out of a government tax fund because it is cheaper. We wouldn't think of having a compulsory private insurance company retirement benefit program which every wage earner had to buy.

But they say beyond that the innocent victim, the man who is in the right will get full compensation. If he gets a busted arm, he will get some payment for the fact that he has a broken arm or if he loses one he gets it for that. He gets that in the traditional tort way, and the opposing driver must carry liability insurance and the amount they carry is far higher than anything we see.

In West Germany 68,000 U.S. dollars is the mark translation of the minimum, Great Britain, absolutely unlimited, Ontario, 35, and they are considering putting it up to 50, where we stagger along here thinking that 10-20 is pretty good insurance.

There have been comments that the man who has heavy losses doesn't recover under our present system.

Senator HART. Comments?

That is a fact; isn't it?

Mr. SPANGENBERG. Sure, because your liability limits are too low. The other countries said the way to cure that is to increase your liability limits. It doesn't cost that much more.

As you know, the difference between carrying 100-300 and 25-50 is a couple of dollars a year. There are other ways to reach this same result. I think we could just put that in a capsule form. We are not concerned with how many benefits you give everybody. We are only concerned with what do you take away from the man who is completely right.

Senator HART. We are in agreement that the existing system fails dramatically to respond to what you are talking about?

Mr. MARKUS. Yes. The social security system is inadequate, I agree with you.

Senator HART. I am talking about the existing automobile insurance programs where, and I think the facts are accepted—

Mr. SPANGENBERG. It doesn't fail as bad as the Hart bill.

Senator HART. Let me put it this way.

The average total economic loss for claimants totally disabled runs about \$78,000, but the actual set limits run less than \$13,000—16 percent of the loss. Are we in agreement that that system should be corrected?

Mr. MARKUS. First, I think your information can be modified somewhat. Again, from the Department of Transportation studies, of all—

Senator HART. That is where it is from.

Mr. MARKUS. I agree. Of all of the claimants who made claims and who received any money at all from the tort liability system, 97 percent received as much or more than their economic loss.

Now, we are talking about in the figures you are giving us, we are talking about the fact that there are many people who are not eligible for any money out of the tort liability system, and they therefore, necessarily will dilute those numbers drastically. Those people are people that should be protected by the social security system, and your data is a condemnation of the fact that our society has not given proper attention to people who fall down steps, who get cancer, or who are foolish drivers and go through red lights or go crashing into trees.

Senator HART. That is what we are looking at now.

Mr. MARKUS. Respectfully, that is not what we are looking at.

Senator HART. Not in this committee. The national health program is not in this committee.

Mr. MARKUS. We are with you there.

Senator HART. But two facts that are pretty stark and that cry out for correction, as I see it, and I sense that you do, too, are first, the woeful inadequate return to the disabled man now under the tort system, and you gave me a figure—I forget what percentage, a high percentage gets more than four times their economic loss—minor claimants under the present system are compensated four times more.

The fellow who really gets stuck with a bad disability is undercompensated even more.

Mr. SPANGENBERG. Please, this is true but please don't get hung up on this overcompensated four times. You are not talking about many dollars first.

Senator HART. Not talking about what?

Mr. SPANGENBERG. Many dollars.

Senator HART. We are talking about a lot of people, though.

Mr. SPANGENBERG. The man who has \$150 in wage loss or \$100 in wage loss and medical bills may go back to work and work with a sore back for weeks, but he gets more out of working, and he wants to keep his job. The statistics of DOT is that if he settled for less than \$500 he might get four times as much as his direct economic loss.

This was only 7.8 percent of all the dollars paid out in the system. So, my point is—

Senator HART. Ninety percent of the system's time was involved because that represents about 90 percent of the claims.

Mr. SPANGENBERG. A lot of adjustment claims. You are still going to have a lot of adjustment claims under your system, you understand. Not many of these claims go to a lawyer, not many go to court. These are the claims settled by the adjuster so that they don't go through a lawsuit.

Aren't there other ways to cure that without saying to a college student, if I may use that example, who gets his arm torn off, and I had one of those cases, a sideswipe, a boy suffered a traumatic amputation of the arm—this fellow carried Blue Cross and was driving—under your bill the insurance company pays him nothing.

Blue Cross paid all his hospital, Blue Shield paid all his medical. Your bill is excess. He was a college student so he had no wage loss. He would get nothing under your bill. He lost his arm with traumatic amputation for life. He gets nothing under your bill because he isn't 70 percent disabled.

Senator HART. On that point, I am advised that the Trial Lawyers Association has suggested language in communication with committee staff modifying the definition in order to respond to this problem. and I would ask you if either of you happen to be familiar with it.

Mr. MARKUS. I am familiar with the language, Senator.

Senator HART. Can you explain generally what would be achieved by the adoption of this language?

Mr. MARKUS. In our discussions with your staff, we attempted to explore what we thought were some rather drastic provisions in the bill. Even in the former language of the bill which described that

there would be payment for human losses or general damages only if there was permanent loss or loss of use of any bodily function or member. We pointed out the standard of permanency is an unreasonably great standard. You are, in fact, still doing an overkill: We thought if there were a standard that said that the disability extended for some reasonable period of time, and we suggested 14 consecutive days, that this would eliminate a very substantial portion of the really trivial cases but would still keep a meritorious claim alive.

Senator HART. You suggest the use of "compensable" instead of "catastrophic."

Mr. MARKUS. Let me explain if I may.

Senator HART. Let me read it for the record so the reader of the record will get a better understanding. Your suggested language is:

The term "compensable harm" means a bodily injury, including death, at any time resulting therefrom which results in a partial or total loss of, or loss of use of, a bodily member or a bodily function if such loss, or loss of use, extends for at least 14 consecutive days at any time after such injury.

What does that mean? What do you reach there?

Mr. MARKUS. First, let me explain why I suggested to your staff that you not use the words "catastrophic harm" and instead use the words "compensable harm." You earlier commented on what you felt was emotionally charged language in our statement.

I commented that the word "no-fault" was an emotionally charged word. If lawyers are going to be going into court to make claims and the Federal Government says this is a catastrophic harm, I think it is obvious there is going to be a larger verdict than probably is reasonable.

I represent the claimant, and I must say that is not fair. So I try to tone down and take out the colorful language by suggesting that you call it compensable harm instead, which is really what you are talking about regardless of what language is chosen.

I then try to approach the question that I think you are seeking to answer. That is, where is the standard that will realistically eliminate trivial cases and still keep a right to compensation for the human losses of disability, periods of intractable pain, and a real unhappiness in a substantial matter?

That is a difficult line to draw, I recognize it is a difficult line to draw, and I am sure that you and your staff have struggled with that a long time. Frankly, I was astounded when I saw that you came up with 70 percent permanent partial disability. That to me is not drawing a line at all. It is saying don't bother with it.

From our experience, from our study of the DOT studies, from our evaluation of this whole picture, several of us who are in the leadership of this association talked about this, and we tried to reach a conclusion as to what we thought might be a meaningful standard that would be possible, and we arrived at the one that is described here.

Mr. SPANGENBERG. May I give you a quick for instance?

One of my pending cases, where fortunately the tortfeasor was a large well-insured truck company, involves a young fellow who entered into a partnership with a friend to paint stripes on a highway. They were going down the highway, they had set out red lights and 5 miles of yellow markers behind them.

A truck driver apparently hypnotized by the road drove right down the five miles of markers and ran right over the whole painting truck.

That young man has been in and out of hospitals for over 3½ years trying to get put back together. The doctors now think they have secured the osteomyelitis which he had developed or have it quiescent, you never cure it, but they have gotten him put together quite well. He can now walk, he has gone back to work.

I do not think that you could say he has any permanent loss of function. He will get it again if the osteo flares up. But I point out to you that this man has had over a year in total hospital days, he has been totally unable to enjoy life at all or to perform the kinds of things that young men like to perform.

I think he is entitled to compensation for that temporary disability that went on for 3½ years. Where you have drawn the line before he gets well, I don't know. The same thing with your standard on irreparable plastic surgery. I had one client who went through 26 different surgical procedures to finally get a face put back together.

After 5 years she had a passable face. But wasn't she entitled to some compensation, again a woman who was completely in the right, for this dreadful period of time when she couldn't even go out of the house and didn't dare see her friends because her face looked so awful.

It was temporary and finally repaired.

But coming back to what other countries have done, I say I think the United States should have as much concern for individual rights, for the right of the free man to go about his business and play golf and bowl and go out with the boys to the bar drinking and ski or fish or whatever he likes to do. This is a valuable right, we think it is. We say we are free men, we can do these things, and if someone wrongfully takes those rights away, since our country was founded, we have said they should be paid for.

Every other free nation in the world pays for those things. They say they think their citizens' individual lives have value, and we view a bill that says there is no value to that at all in this country today, we think does not reflect the fate of the American people.

Senator HART. If that fellow that you are talking about had not had the good fortune to turn to you, given these figures that the DOT gives us, that poor fellow, forgetting whatever dollar sign you put on the joy of playing golf, he wouldn't have gotten more than a third of his economic loss.

Mr. SPANGENBERG. Not so. He carried Blue Cross, he carried Blue Shield, he had catastrophe medical insurance. He was already carrying first party.

Senator HART. You make him sound as though he was lucky.

Mr. SPANGENBERG. Eighty-five percent of the population now carry their own private health insurance, all of which you will put in underneath—

Senator HART. You are talking now about the intangible losses. We are trying to find a line to draw.

Mr. MARKUS. In the example that Mr. Spangenberg gave, that man was the innocent, and did have a tort claim and could and did recover—I don't know whether the case has been concluded, but certainly could recover not the low percent you have described, which takes into account all those people who couldn't recover.

That includes those who had no right to recover, those who were drunk and ran into a tree.

Senator HART. I don't know how many we find in this average of the totally disabled—we are told that they have an average total economic loss of \$78,000 and their insurance settlement averaged \$12,500, 16 percent of the loss. How many were drunk? How many were innocent bystanders? All of us can agree this is wretched.

Mr. SPANGENBERG. Again, Senator, no quarrel, no quarrel with the benefits you give the driver, whether he is right or wrong, no quarrel with that phase of the Hart bill. I don't mean to pretend that your bill gives him any benefits. It really doesn't.

It compels him to buy health and accident insurance from a private insurance company and then he will get the benefits from the insurance he has bought.

But again no quarrel with that. I am trying to address myself to the fact that in order to make this premium—total premium cost somewhat less—I assume that is the motive for it, you say we will not pay the innocent man full compensation.

Now, in this way I think you penalize a man who has a right to recover. You change the legal system completely, and you do it for what reason?

To make the cost lower for the fellow who is wrong.

Senator HART. To do something about this raw figure that I gave you is why we do it, but I think you and we together are trying to find the language that will take care of the intangibles of the innocent.

Mr. MARKUS. All right. I think that is a good goal.

Senator HART. Your own language draws a line so as to bar some of it, ours bars more of it. Together maybe we can find out a line that is appropriate.

Mr. SPANGENBERG. Your language bars about 99 $\frac{2}{3}$  percent of it.

Senator HART. I wouldn't put a percentage on what yours bars.

Mr. SPANGENBERG. Probably 50 to 60 percent, which we thought was enough to get the junk cases out of the system.

Senator HART. We will see if we can develop how much ours bars, but I have imposed on my colleagues.

Senator Moss.

Senator Moss. Did you participate in the hearings on the House side?

Mr. SPANGENBERG. I did not.

Mr. MARKUS. I did.

Senator Moss. I understood that a lot of the language problems have been gone over there and the bill has been somewhat revised on that side. Is that correct?

Mr. MARKUS. There have been some changes made in the House bill. None of them I think are germane to the subjects we are talking about here. The most dramatic one that I saw, and I again feel I must be candid, is the removal of the higher rating for commercial vehicles so that they would be charged at a rate that would be, under the House bill form, the same as passenger vehicles.

This, of course, is a tremendous subsidy to the bus and trucking industry and means that everybody else will have to pay higher premiums. I frankly cannot approve of that approach.

Senator Moss. The figures indicate that there are a great many who are not able to get compensation at all under the present system. So, isn't the real focus of this bill to see that everybody connected in an automobile accident at least gets his medical care?

Mr. MARKUS. Again, Senator Moss, that part of the focus gives us no trouble. It is the focus which says in order to pay for this we are not going to take it out of the general tax dollar, we are going to take it out of the innocent victim and reduce his benefits which we think are deserved. That's our problem.

Indeed, if the Senate were ready now to pass this bill and delete from it section 4 completely, we cannot philosophically disagree with it.

Senator MOSS. But section 4 would have to go?

Mr. MARKUS. Section 4 is the method of paying for it. We say that method of paying for it is morally wrong.

Senator MOSS. We now have, in fact I guess every State has, a requirement of carrying liability insurance for an automobile driver.

Mr. SPANGENBERG. I think only three States make it really compulsory.

Mr. MARKUS. In some form or another there is some type of coercion or direction.

Senator MOSS. I recognize there is variation among the States, but there is some requirement that way. Yet at the same time automobile drivers are having difficulties obtaining insurance. Some of them are getting canceled out and so on. They are having all kinds of troubles.

Mr. MARKUS. Senator MOSS, I think that is an excellent point. This bill does in part deal with some of those problems. As to those we think it is a very creditable effort, and we have been asking in State legislatures for very similar legislation, and we think it is a fine thing, that there be some method of curtailing really wrong underwriting practices and wrong cancellations practices.

This bill frankly doesn't go far enough in that direction. There is still ability of the insurer to use a system which has 10,000 rates, a whole variety of categories of rates. It is left up to the Department of Transportation to decide which categories are acceptable, and there is really little guideline in telling them how many categories will be acceptable.

So, I am concerned that it doesn't go far enough in that direction. But that is not what our problem is. That is not the objection we raise. Your objection is the one that I think the public is raising, that automobile insurance—first party no-fault insurance, if you will—is unmanageable, because the companies are canceling first party no-fault insurance, collision insurance—the companies are canceling, they are making weird underwriting rate structures, they are not conducting themselves in a meaningful or helpful manner for the public in first party no-fault insurance.

Mr. SPANGENBERG. I cannot buy medical insurance in my State at anything like the limits I would like to carry for the benefit of my guest passengers or myself if I were one of those guests.

Senator MOSS. Thank you very much.

Senator HART. Senator Cook?

Senator COOK. Mr. Markus, you said in your remarks when you were reviewing the sections that in your analysis, you point up some of the glaring deficiencies that the committee has not taken into consideration.

I want to make it clear to you this is not a committee bill, that we are here for the purpose of hearing and discussing, and trying to find

out whether a bill should be brought out, and what kind of a bill should be brought out. I must say to you the only thing that bothers me about both of your statements is that it would have been a lot better to speak from the standpoint of the ability of an individual to preserve his right of tort liability, even his constitutional right to recover, rather than to have compromised yourself by saying the real solution is to increase social security and to have a national health insurance program.

I must confess to you that it bothers me. In making reference to the fact that social security benefits, as you put them, Mr. Markus, are too low, and that the Congress should continue to increase them, you imply conversely Congress should continue to increase the tax. Thus you are saying that the Federal Government should reinvent the wheel by establishing a comprehensive national health insurance program so that we can save the right of tort liability on the part of somebody who is injured in automobile accidents.

I think some of the things you bring out are very important, and I would like to compliment you, for instance, in showing some of the deficiencies. Some of the deficiencies are in the field of payment and of loss of wages. There is the fact that this bill completely ignores the loss caused by an injury to a wife, for which there is no compensation under S. 945. There can be none because she is not a wage earner, and there is no way to establish that she is a wage earner, and therefore all of this loss goes down the drain.

I assume the husband would be unable to seek compensation under S. 945, even if he had to hire all kinds of services to take care of his family and his children while his wife was completely and thoroughly inundated in a serious situation.

I think your reference to 3(b), where it forbids a State to require liability insurance, would convince the insured under a no-fault program that he is now carried, and he need not carry any additional coverage.

If you get into an accident with somebody who is not of major standing in the community, you might settle a case. If he is in a major position in the community, he might find himself in Federal court. Therefore, he would still have to continue to carry a tremendous amount of liability coverage over and above any no-fault coverage, because he would find himself by some hook or by crook back in the Federal court, when he thought he was going to be excluded by having a no-fault program.

I think it would have been much better, frankly, to have talked about these things. Rather, you say we should hang on to the ability to go into court for the benefit of tort liability for an injured individual, and that we can satisfy all these things by increasing social security and having a national health program.

MR. SPANGENBERG. This is in response to arguments that have been flooded upon us by people who say as a social measure, as a welfare measure, we must pay the medical bills, the loss in wages of the fool who leaves the curb and wraps his car around a tree.

In the serious injury cases, remember, a third of all serious injury cases are single car collisions. That is a social argument, isn't it?

Senator Cook. I think it is.

MR. SPANGENBERG. So, we said if you are persuaded by that social argument that you must take care of the single car victim and the fel-

low who is passing in the no-passing zone and so forth, that same argument means you have got to take care of the man who is injured when he is taking down his screens, and so forth.

If that is your approach, the social approach, then we say go all the way.

Senator COOK. If we are going to have a national health insurance program, and the estimated cost after the third year is \$77 billion the consumer is going to find some type of tax that he is going to pay and it is going to be substantial, and it is going to deprive him of having the kind of health insurance that he wants.

Maybe he wants health insurance, when he is in the hospital that will pay a thousand dollars a month, so that he can keep his wife and four or five children at home when he is not being paid and he is in the hospital for an automobile accident.

Mr. MARKUS. Perhaps I could make some additional clarification. Really I think it is a question that these are difficult policy judgments that everyone must make and certainly the Senate must make. If you feel that there should be social legislation that tends to solve that type of problem, other than letting each individual buy the insurance which he thinks is most proper for him, then we suggest that you should do so, but you should not use this automobile insurance system as the excuse.

Senator COOK. I think the only criticism I am going to make today, Mr. Chairman, relative to this, is that it may be all right to be for a national health insurance program and not for no-fault, because there are fewer cases that we can have in court that deal with problems that are not involved in automobile accidents.

Maybe that is why we should say it is all right to have a national health insurance program and not no-fault.

Do you see serious constitutional questions in this approach?

Mr. MARKUS. I do. I might say I have just finished writing an amicus curiae brief relating to the Massachusetts statute. I have very serious doubts—that statute is not as drastic as this—but here are due process considerations that are very real here, and equal protection decisions that are very real.

As it is now drafted, I read this as being an invidious discrimination against the poor. I know that is not the intent of it, but I believe it exists under the legislation as it now exists.

Mr. SPANGENBERG. This bill would override the Ohio constitution's right to sue and recover which is covered in the 1912 Ohio constitution.

Senator COOK. I wonder if the staff might make some analysis of all constitutions in that regard.

Mr. SUTCLIFFE. The Department of Transportation study has addressed this question, and we have also requested the individual who did the work, on what State constitutions will have to be modified to provide the committee with that information.

So it will be available shortly.

Senator COOK. Having been a member of a State legislature, it is not going to be easy for State legislatures to modify their constitutions. For instance, in the State of Kentucky, it has to be presented to the State senate and house, and then be presented to the people in a referendum. This is going to be a very difficult thing to do.

Would you mind, because I would consider it a privilege to have it as a part of the record, submitting a copy of the brief that you submitted in the Massachusetts case?<sup>1</sup>

Mr. MARKUS. I would be most privileged.

Senator COOK. Other than this brief, what is your reaction to the Massachusetts experience? We had a gentleman who testified for and on behalf of the Governor of Massachusetts, who said that he considers this program a success on its 3 months' history.

I would like to have your comments.

Mr. SPANGENBERG. I am so happy that you asked me about Massachusetts.

May I say first, Massachusetts can be no test for the rest of the United States, and I can document that. The Department of Transportation publishes once a year a highway accident data book in which it lists all accidents, for all States, and those figures for 1968 show 13,600,000 accidents.

Only 1,600,000 produced any injury. If it did produce an injury, it averaged 1.7 injuries. So there were 2.6 million injuries out of 13,600,000 accidents.

In the same period in Massachusetts, the same year, 6 months' study, 144,000 accidents, 155,000 injuries. In other words, Massachusetts was having an injury rate seven to eight times greater than anywhere else in the United States. That curiosity lead me to investigate why should that be so in Massachusetts.

The only explanation I can give you is that Massachusetts had compulsory PI, personal injury liability insurance, no compulsory property liability insurance or property damage coverage or collision coverage.

I think what was happening was that in the Massachusetts fender benders on the Boston freeways, which are terribly designed, people were getting out and complaining about an injury to a neck that really translated into "fix my fender."

As soon as you go into compulsory property damage liability, as they now have in Massachusetts, those figures have to reverse. I would expect Massachusetts now will come down to the normal rate. They haven't quite gotten there yet, because the population isn't retrained yet. But there has to be a tremendous decrease in personal injury claims in Massachusetts because they started out eight times higher than they had any right to be.

But I would also point out that while in Massachusetts they decreased the PI liability insurance rate by 15 percent under legislative mandate, they at the same time increased the collision damage rate by 37 percent. So, there is no overall premium saving.

Again fenders and glass cost more than people in our insurance system. So, the insurance company can easily tailor a rate and say we will charge less for PI if we can charge more for property, which has happened in Massachusetts.

For that reason, I can't draw any valid conclusions from any result that happens in Massachusetts because they started out as a completely abnormal State, and what happens now may get them back to something different for Massachusetts, but would have no relevance for

<sup>1</sup> See p. 682.

Arizona or Montana or Ohio or Michigan where the injury claim rate is much more in line with national levels—where our personal injury liability rates are really very low and a very small part of the premium.

Mr. MARKUS. If I can supplement that by saying, to the extent you draw any conclusion at all from the Massachusetts experience, it has to be a condemnation, because according to the data that has been released for the first 3 months, they are paying half as many people as they paid for the previous year.

If a no-fault proposal is one that is supposed to make sure that those who are not now entitled to compensation receive some compensation, they are apparently failing miserably in Massachusetts since they are paying 50 percent less people.

Frankly, I think the reason they are paying 50 percent less people is the reason that Mr. Spangenberg has already outlined, that what were previously personal injury claims are now property damage claims. If you are going to draw any conclusion, it has been a failure for the public and a great bonanza for the insurance companies because, as the Governor pointed out, the companies are making a tremendous profit and keeping it.

Senator COOK. Let's get down to section 4 which you were discussing with Senator Moss and Senator Hart. Under our present system, I expect that almost every State in the Union has definitions of what we refer to as catastrophic harm. Maybe some do not. At least if they have it nowhere else they have it as a matter of case law.

Where do we find a standard for the phrase "catastrophic harm?" Does this revert to State law or Federal law? How do we make this interpretation? Where do we get it from?

Mr. SPANGENBERG. There is no standard anywhere in the world. There is no standard in any State of the United States. There is no other place in the world that takes away the right of a man to recover unless he has come up to some defined level of injury.

In the workmen's compensation field—

Senator COOK. That is where we come the closest, isn't it?

Mr. SPANGENBERG. Yes, but it is just any partial disability.

Senator COOK. But this is all done at the State level?

Mr. SPANGENBERG. It is just any partial disability.

Senator COOK. My point is, as far as the liability aspect of catastrophic harm, where do we make this determination of what it is, at the State level or at the Federal level? I am at a loss in reading section 4, and I just wonder how you would interpret it.

Mr. SPANGENBERG. I was raised in New England. Can I answer a question with a question like a good Yankee does? Why should you define catastrophic harm? Why should the man who was half destroyed get nothing and the man who was three-quarters destroyed get something?

Where do you draw the line of saying that a man who has disability shouldn't get paid?

Senator COOK. I am not arguing with you, because I have trouble with section 4, and I have trouble trying to figure out how to make a determination that, if, in fact, a suit is filed, what type of definition, at what level, would it be a federally created definition? I don't know.

Mr. MARKUS. Let me try and answer that, if I may. I think there are really two questions implicit in what you are saying.

The first is what is the standard for determining whether there is a right to bring an action, whether it is called compensable harm or catastrophic harm, and I suspect that that would be the standard that is placed in the statute itself. It seems to me that that is where that is being defined.

The second question, however, that is in the background, is what law governs the liability issue itself, who decides whether the fellow was innocent or guilty, at fault or not at fault? I would suppose except as expressly provided here that would be by State law, but I submit there is nothing in the State that says so.

The statute certainly could have help, I think, legislatively, if it said that State law or Federal law governs in certain respects, because otherwise I can see lawyers—and I respect the right of every lawyer to raise an argument—I can see that lawyers might argue with some merit that a new Federal standard of liability has been created and that all issues of liability will be resolved by some undefined Federal liability law.

Mr. SPANGENBERG. I wish you would go farther and consider comparative negligence, too. Remember the DOT in the query. "Do you think the system could be changed?" About a third of the people said yes, it should be, and they said "How?" and of the people who answered, half of them said comparative negligence.

Mr. MARKUS. If you are going to affect the tort remedy at all, let's affect it in a good direction, and a constructive direction. That is what we are saying.

Senator COOK. Let me argue one point with you philosophically, because one of the main arguments you have presented is somehow or other you think it is absolutely wrong and unconscionable, that the guilty driver should recover.

Mr. MARKUS. I will not debate that. I don't care if he is or not. If he has collision insurance, let him get his car fixed. If he carries medical pay—I think most drivers do, in my State 85 percent are covered—guilty or not he gets his bills paid.

Senator COOK. In your statement you say "We believe that such true social reform should be funded by the general population. It should not be supported by a regressive victim tax like no-fault insurance which takes money away from the innocent in order to pay health benefits to the guilty."

Mr. SPANGENBERG. Don't take money away from the innocent and the whole paragraph can be deleted.

Senator COOK. My whole point is it is being taken away from me now. That is the basis of my rate. I am paying for the guilty driver now. Isn't this the basis by which the rates are established?

Mr. SPANGENBERG. No.

Mr. MARKUS. I tried to make this explanation before, and I really didn't finish.

Senator COOK. I know you didn't, because I am sitting here watching my insurance premiums go up each year without any accidents. The only way I can figure the company I am in, I am carrying the load for the guy who has four or five accidents and he is still insured.

Mr. SPANGENBERG. You are in the wrong company then, but don't name it. But most companies fix a rate, to an incomplete extent, which

reflects the risk that a driver in that class will have an accident that year.

Senator Cook. I don't disagree with you, but when the insurance company comes before the State insurance commissioners and asks for a rate increase, he pretty well asks that rate increase across the board. He may leave me in that classification, but he is still increasing my rate, even though he is increasing it within that classification, and the reason I am getting a rate increase is because some other classification that he can't increase the 40 or 50 percent that he ought on, he may only go 10 or 15 or 20 percent.

So in essence I am picking up part of that bill. I don't think we are going to argue too seriously about that. I hope not.

Mr. MARKUS. There is no question about that, certainly.

Mr. SPANGENBERG. That is why I am very much pleased with your approach that the Department of Transportation ought to at least take a look at the rating structures. One of the DOT studies was Dr. Brenner's analysis, which I thought was very persuasive, that there is not a sufficient distinction in rates now between the very high risk driver and the average driver.

With a collision under no-fault the average driver's rates are going to go up.

Senator Cook. By the way, I am delighted that in your combined statements you refer to court congestion and you favor "realistic quotes of judges based on population so that our courts can meet the staggering criminal dockets and have some time left for civil dockets."

Frankly, I think this ought to be considered as a constitutional amendment the same way that we considered the selection of Congressmen based on population. We should take this out of the Judiciary Committee, sitting down and deciding when a State ought to have a new judge and when it shouldn't have a new judge. There ought to be a constitutional provision that says when a population increases within a given jurisdiction it is automatically entitled to a new judge.

Mr. MARKUS. You struck a nerve. I want to add that first we are supporting such legislation.

Senator, Florida does have that in its constitution now. We are seeking similar legislation in other States, and as a matter of fact I even have pending now a case in my own district which urges that the denial of equal judges on a population basis is a denial of equal protection under the Federal Constitution.

Senator Cook. In your statement, you say, "Several weeks ago Judge Thomas C. Clark, former attorney general and supreme court justice, characterized the 'no-fault' plan as 'no fair for the public.'"

Can you give me the source of that? Was it part of a speech or was it a comment? Did he make a speech where he developed this as a matter of topic?

Mr. MARKUS. This was a speech that he gave at the California Trial Lawyers Association convention about a month ago, as I recall.

Senator Cook. Would it be possible to get a copy of that speech to put in the record?

Mr. MARKUS. I believe his remarks are contained in one of the most recent issues of our publication, *Trial* magazine, and I will be happy to supply it for the record.

Senator HART. It will be received.

(The article follows:)

[From Trial magazine, March 1971]

**EX-SUPREME COURT JUSTICE CLARK HITS NO-FAULT INSURANCE PROPOSAL**

Palm Springs—Retired U.S. Supreme Court Justice and former Attorney General Tom C. Clark criticized California proposals to adopt a compulsory "no-fault" automobile insurance concept and abolish the traditional right to a jury trial in civil cases Saturday.

Clark took issue with the controversial plans at a press conference in the Riviera Hotel preceding his luncheon keynote address to the California Trial Lawyers Association's sixth annual convention.

Calling the jury system "the only bulwark we have for protection of the individual," Clark denied claims that civil cases were the primary cause of congestion in the courts. He placed the fault, instead, on the greatly increased number of criminal and post-conviction remedy cases. A committee of Los Angeles Superior Court judges recommended abolishment of civil jury trials last month.

"Our main problem with the judicial process today, however, is a lack of information, a lack of dialog with the public. Judges," he said, "are rather sensitive to talk. They can't put on robes and join picket lines. They can't mount public relations campaigns. They have no money to take out ads in newspapers.

"Indeed, the jury system provides the only real contact the courts have with the public. All others," Clark said, "know the court system either as visitors to or violators of the system."

Clark said there are several ways to improve the system and make it more efficient and economical. He cited a pilot program underway in Minnesota involving a reduction in the number of jurors.

"The cost of maintaining the jury system is not as heavy as some say it is," according to Clark. "But even if it is, I think it is a price we can and must afford."

In the matter of "no-fault" insurance, currently under consideration in the California Legislature, Clark said the concept "does not afford the protection and certainly not the returns that civil litigation affords."

Here, again Clark called the argument that automobile accident cases are congesting the courts as "specious." In most personal injury accident cases, he said, "the determination of fault is a simple matter and once that is accomplished it is amazing how few cases ever get to the jury trial judge. Most are settled out of court."

Clark warned that the "no-fault insurance plan would impose the "same computerized, scheduled benefit type of system on automobile accident victims that Workmen's Compensation has so confusingly, ineffectively and unsatisfactorily imposed upon the American working man.

"I am a firm believer in the jury system as one of the cornerstones of our American freedoms," he said, "and would consider any elimination of it as a reduction of our basic rights."

Senator COOK. Thank you, Mr. Chairman.

Senator HART. Mr. Sutcliffe.

Mr. SUTCLIFFE. Mr. Markus and Mr. Spangenberg, I would like to spend some considerable time, with your permission, to find out where lines are being drawn under existing proposed legislation and how we can draw lines in other ways in order to build a record that this committee can use in forming intelligent positions on legislative proposals. So I will go through the prepared hearing statement and ask you specific questions as they occur.

You say, "We submit that the 'no-fault' concept has been foisted on the public by a misleading multimillion dollar public relations campaign \* \* \*." Since you have broached the subject of public relations campaigns, let me ask you a few pointed questions.

First, would you tell this committee what you know about an organization called LIFT?

Mr. MARKUS. It is my understanding that there are people in Texas who are interested in political action in the same fashion as the—

Mr. SUTCLIFFE. You say people; what people?

Mr. MARKUS. I believe they are principally lawyers. I am not sure that they are entirely lawyers.

Mr. SPANGENBERG. I think the word "LIFT" translates to Lawyers Involved For Texas.

Mr. MARKUS. That is correct. They have been to my knowledge largely involved in political action efforts in the State of Texas.

Mr. SUTCLIFFE. Would you tell this committee what you know about an organization called ADOPT?

Mr. MARKUS. This is a similar political action organization that is being considered in my own State, I believe it is in its formative stages, for political action in the State of Ohio.

Mr. SUTCLIFFE. Is the political action you have mentioned directed toward any particular goal?

Mr. MARKUS. My assumption is it is toward all political action of the people who are supporting it, and I would include in that certainly legislative goals in the automobile insurance area as well as others.

Mr. SPANGENBERG. I assume ADOPT will try to work in comparative negligence, abolition of the guest passenger law in Ohio which says the guest passenger cannot recover no matter how negligent the driver is.

Mr. SUTCLIFFE. Will that organization work against anything?

Mr. SPANGENBERG. It will certainly work against any no-fault plan which takes away the right of recovery.

Mr. SUTCLIFFE. In the intangible area?

Mr. SPANGENBERG. In the intangible area.

Mr. MARKUS. I might say the items you are describing—frankly I wish they were stronger and more effective—represent a very minuscule percentage of the amount the insurance industry is now spending in this area. We have reason to believe it is many millions of dollars.

Mr. SUTCLIFFE. Are these organizations established to counter insurance expenditures?

Mr. MARKUS. No. But I gather from the tenor of your questions you are implying that this is their purpose.

Mr. SUTCLIFFE. I have no knowledge of these and am only inquiring as to what they are.

Mr. MARKUS. They are political action groups to attempt to accomplish in their States political goals, similar to those which are established by unions, trade associations and so forth. The American Medical Association has a very large one. I am afraid the ones you are describing are small in comparison to the others.

Mr. SUTCLIFFE. Has your organization considered a budget for 1971-72?

Mr. MARKUS. We will be considering a budget at the next board meeting which will occur on May 22 and will then eventually be considered by the general membership. Thus far, of course, we are in the formative stages.

Mr. SUTCLIFFE. In the proposed budget you will take before the board on May 22, have you allocated any new expenditures of significance?

Mr. MARKUS. Yes. I would say we have allocated first money for staff personnel who will assist in the relationship between the national organization and the State organizations. We also have allocated funds for a public information organization to try to carry our views to the

public in a very small way. We wish it could be more extensive, but it will be very small compared to other people who have apparently more funds for such purposes, and also to give us an opportunity to have better liaison with this Congress.

There will be some funds for that purpose so that we can give information to the Members of the Congress and their staff members who we think are anxious to hear what information we think we have.

Mr. SUTCLIFFE. So these will be experts able to offer constructive suggestions?

Mr. MARKUS. We are hopeful. These things have not been finalized.

Mr. SUTCLIFFE. It would not be in the normal sense a PR operation?

Mr. MARKUS. I think some of the effort will be in using personnel who are experienced in the field of public communications so that our position can be communicated. I am afraid that lawyers may be very effective in understanding or evaluating but very poor in communicating with the public media.

Mr. SUTCLIFFE. Let me go on to another question arising from testimony of your statement. You say "It may be worth noting that national health legislation would probably mean a major reduction in legal fees, yet we support it."

By your own estimates 89.2 percent of injured auto victims have medical expenses of less than \$500. DOT tells us that 95.8 percent were not hospitalized for as much as 2 weeks. For the record, are you sure that national health insurance will mean a major reduction in legal fees arising from automobile accidents? Because it seems to me that a very small percentage of the injury population would have a very large percentage of medical recovery upon which a fee of an attorney would be based.

Mr. MARKUS. We do know from the DOT studies that 53 percent according to their conclusions, of all economic loss are medical expense. The American Insurance Association claims 61 percent of all economic loss are these medical expenses. I cannot help but say that that involves the potentiality of a major reduction in legal fees. It seems to me that, manifestly, is there.

Mr. SUTCLIFFE. What is that? Are legal fees a measure of intangible loss?

Mr. MARKUS. No. I cannot tell you what the legislation would be in the national health legislation, but it would seem there is a great likelihood that no one would need a lawyer to recover those fees. I assume the frequency for needing a lawyer for social security cases is much lower, though there are some, when people need and should have lawyers. The frequency in national health insurance programs should be much lower.

Mr. SUTCLIFFE. As to its impact on the tort liability system, we were trying to analyze the need for lawyers in the tort context, not in the context of pursuing claims for national health insurance.

Mr. MARKUS. I think first to the extent that you remove the medical expense element from a claim you have significantly reduced legal fees, and secondly—

Mr. SUTCLIFFE. Now, let me understand what you say about, "Significantly reduced legal fees." If more than 90 percent of the accidents have less than \$500 in medical expenses and you have a certain percentage of your fee based upon recovery, then as to the individual

lawyer, is there going to be a sufficient reduction in the fees he recovers?

Mr. MARKUS. The answer is yes.

Mr. SPANGENBERG. Again you are talking about dollars, aren't you? Half of all claims are settled for \$500 or less, but that is only 7.8 percent of the dollars. I think about 20 percent of the cases produce 80 percent of the dollars.

Mr. SUTCLIFFE. That is the point. If you are still preserving 80 percent of the dollars upon which the legal fee is based, how much of an impact upon attorneys' fees is the national health insurance going to have? I am simply trying to clarify the record.

Mr. SPANGENBERG. I have had a number of cases in which the medical expenses exceeded \$15,000. The national health insurance programs in Canada, for example, all provide that the national fund has a lien on recovery and gets reimbursed. If I recover for a client the \$15,000 in medical fees, which is subject to a lien which is reimbursed, I do not charge the client on that. He did not get it. Therefore, if you are taking out—there is an assumption in here that the national health insurance would be of the type around the world most of which lien their payments, and if you recover they take it back and the lawyer does not charge a fee on it.

This cuts across not only automobile cases, but all broad liability cases—I was going to say air crash cases, although I have only had two cases of survivors of air crashes, they are mostly death cases, of course.

Mr. SUTCLIFFE. I do not want to belabor this point, and upon reading the record if we have any further questions, perhaps we could submit them in writing to you to clarify that statement about how there would be a rather marked reduction in legal fees from a national health insurance program.

Mr. MARKUS. I think anything we are talking about would be dependent upon the language of the particular legislation, but we have reason to believe that it would probably have a significant impact. Of course, it will depend on the language of the legislation.

Mr. SUTCLIFFE. Mr. Markus, Mr. Spangenberg, you point out that your organization has fought hard for the elimination of contributory negligence as a defense to a claim, and that you also have tried to eliminate certain tort immunities—host-guest statutes and the like. Will this kind of elimination or modification of the existing tort system increase the amount of benefits reaching the injured victim?

Mr. MARKUS. It will increase the number of people who are entitled to recover. To the extent that people are now complaining that some innocent victims are not receiving compensation, we must acknowledge, not only that, we must endorse their position that some innocent victims are not receiving compensation, and we say they should be receiving compensation.

Mr. SUTCLIFFE. A corollary question must follow then. Would this enable more cases to be litigated?

Mr. SPANGENBERG. No. Dr. Rosenberg did a study on that in Arkansas which changed from a harsh contributory to a comparative negligence statute. His results were that more people were paid. They were paid on the average less. The total dollars was about the same. That is, if you give the jury a chance to knock off 5 or 10 percent they

will. If you say all or nothing, some cases where they would tend to reduce, they do not. It has not led in the States that have comparative negligence to more litigation.

Mr. SUTCLIFFE. I am asking if we as a committee, when considering a modification at the Federal level, as you have suggested, to establish a comparative negligence program, must consider the litigious effects of that particular modification.

Mr. SPANGENBERG. I can tell you there is no statistical evidence in the States which have adopted comparative negligence that it increases dollars paid out or premiums or that it increase litigation. Litigation is a very small percentage of the cases in any event, as you know.

Mr. MARKUS. As a matter of fact, it may well have the opposite effect, because it increases the likelihood of settlement, since the issue of whether it is all or none is gone. It is then that you should be getting some type of compromise.

Mr. SUTCLIFFE. Mr. Markus, in your statement you ask "Government and industry to stop paying lip service to safety measures."

In light of Congress enactment of the National Traffic and Motor Vehicle Safety Act, or Highway Safety Act, certain proposals in S. 976 and the alcohol study now being funded out of funds from the Highway Trust Fund, is that comment appropriately directed to this committee?

Mr. MARKUS. Not at all. First, may I make a word of explanation that may help us. The language that you are reading was the language that was provided to you last night. There were some minor modifications in editing which is in the prepared statement submitted this morning. I apologize for our inadvertence in not having our final form to you last night.

Our attack here is there has been really inadequate attention to driver licensing requirements, and this is not necessarily by this Congress—

Mr. SUTCLIFFE. Who is responsible for licensing?

Mr. MARKUS. To date it has largely been with the States, and it may well stay there. We are saying that measures in those areas are necessary, that the intoxicated driver has to be gotten off the roadway and the incompetent driver has to be gotten off the roadway, and roads have to be made better and cars have to be made better. The Federal Government has some involvement in this, and frankly it has done a much better job than the States in this area. We think that more effort is necessary.

Mr. SUTCLIFFE. I simply wanted to clarify what your meaning and focus was for the record.

Mr. SPANGENBERG. When you mandate safety belts on the cars you ought to mandate that the drivers wear them.

Mr. SUTCLIFFE. We have made efforts through passive restraints requirements.

Mr. SPANGENBERG. You are coming to that.

Mr. SUTCLIFFE. I think the Department of Transportation is trying to protect the passenger and the vehicle.

Something puzzles me in your testimony where you claim there is no truly reliable actuarial study to support the claimed premium reduction. How does an actuary proceed to calculate the amount of premium necessary to take in, in order to cover future losses?

Mr. MARKUS. There are two basic elements involved in this estimate or guesstimate, if you will. First, to determine what the average payment will be and how that compares to the average payment now, and second, to determine how many people will be paid and how that compares to the number of people that will be paid now, and then imposing certain historical data on those conclusions so as to arrive at the premium number.

There is no sound basis on which to predict either of the critical numbers, that is, whether the average payment will be one number or a different number is really a big guess, based upon very limited data because there is not data available for a huge number of people who are injured.

The Department of Transportation study itself points out the severe limitations on its own data because it was only able to survey a small number, and even the insurance industry is guessing. Even more tragic is their guess as to how many people they will pay.

Mr. SUTCLIFFE. Isn't this from an actuarial standpoint, one who looks at past experience to judge future experience—

Mr. MARKUS. But there is no experience. That is what I am saying.

Mr. SUTCLIFFE. That is the precise point. Your condemnation of no precise actuarial data is a condemnation of the science of an actuary which must rely on past data. Any change to a new system will have a very difficult time establishing reliable actuarial data.

Mr. MARKUS. I agree.

Mr. SPANGENBERG. We are in agreement on that.

Mr. SUTCLIFFE. So I just want for the record to point out that this is not necessarily a condemnation of attempts to move in a new direction. If we were to rely upon precise actuarial data we could never move, because the science of actuary is based on prior experience.

Mr. MARKUS. Only to the extent, Mr. Sutcliffe, that if you make a drastic change you have got to recognize that there are some highly imponderable, unpredictable characteristics, and consider that as one of the factors. We really do not know what will happen to the rate structure. I think there are wild guesses which are being made for public benefit but not for anybody's real reliance.

Mr. SPANGENBERG. In the year 1968 there were very reliable estimates of how many people were injured. The National Institute of Health made them, the National Safety Council made them, Travelers Insurance Co. made them, DOT made a head count. The number of people injured in that year ranged from 2 million to 2.3 to 3.1, 2.6 and 4.4 million. That is a tremendous range. The DOT in its formal published study used the 4.4 million—

Mr. SUTCLIFFE. 4.75.

Mr. SPANGENBERG. Well, one of them on economic consequences said 4.4

Mr. SUTCLIFFE. The final report is 3.75.

Mr. SPANGENBERG. That was based on the Statistical Abstract of the United States. The table to which they refer is published in the abstract but it is itself only an estimate by Travelers Insurance Co. At the same time another department of DOT has published what was supposed to be the most accurate compilation of all highway accident facts in 1968 which said 2.6 million.

Mr. SUTCLIFFE. Is there any question, though, that we have a goodly number of automobile accidents?

Mr. SPANGENBERG. Oh, there are a lot of them. There are a lot of them. And I do not fault the actuaries if they cannot come up with a number of how many people are injured and how badly. The data just is not there.

Mr. SUTCLIFFE. The Department of Transportation is working very hard to develop an accident investigation system which will be able to give us the precise estimates and the causes for each accident.

Mr. SPANGENBERG. I think their 2.6 is the best estimate of all, although it is not in their published report.

Mr. SUTCLIFFE. To the point about the failure of the S. 945 to require compulsory liability insurance, you have already pointed out that three States only in the United States require compulsory liability insurance.

Would you care to comment on why you have singled out S. 945 for criticisms whereas under the existing situation your compulsory States are only three in number?

Mr. MARKUS. May I make a brief explanation since I was the source of that particular writing?

S. 945 prohibits any State from either having compulsory insurance or even having a financial responsibility law, as I read it.

Mr. SUTCLIFFE. Explicitly?

Mr. MARKUS. Yes.

Mr. SUTCLIFFE. Explicitly?

Mr. MARKUS. Yes.

Mr. SUTCLIFFE. Have you had an opportunity to review the House bill that parallels S. 945—

Mr. SPANGENBERG. I have not.

Mr. SUTCLIFFE (continuing). Which has made changes of this nature to comply with some of the problems that you have spotted?

Mr. MARKUS. I cannot tell you whether that change was made.

Mr. SUTCLIFFE. I just suggest that you might look at that. This committee will look to see if they have taken care of that problem.

You mention the need for property loss reduction standards and sense titling laws.

Are you aware of S. 976 before this committee at this time?

Mr. MARKUS. In general terms, I am. Not in specifics.

Mr. SUTCLIFFE. This legislation does mandate particular bumper standards, gives authorities to the Department of Transportation for property loss standards, and sets up a diagnostic inspection system to remove unsafe vehicles from the roadways. It was introduced as a package along with S. 945 sponsored by Senator Hart and Senator Magnuson. To suggest that S. 945 did not consider that is to ignore the joint introduction of that legislation along with S. 976.

Mr. MARKUS. All we say is the package should be untied, that there are good things in much of this legislation and there are some bad things in some of this legislation.

Mr. SPANGENBERG. We certainly support the bumper bill.

Mr. SUTCLIFFE. If you had your choice, would you support a Government-run facility for providing tangible loss benefits to injured accident victims, or would you prefer that the tangible loss sources be left to private insurance carriers?

Mr. SPANGENBERG. Government, based on world experience. It is much cheaper that way when you go into any kind of welfare or social legislation, which we think this is.

For instance, Ohio is one of the few States which has a State-funded workmen's compensation system. We pay benefits quite comparable to other States. The total cost of administering it has always been less than 10 percent of the premium. The cost of a private insurance carrier doing it runs 65, 67, and 70 percent.

Mr. SUTCLIFFE. Has your organization ever considered the possibility of putting on a mandatory first-party basis recovery for intangible loss?

Mr. MARKUS. I am not sure how this would be structured.

Mr. SUTCLIFFE. Let's just suppose that you submit it to a jury, as we do now, and you have the representation of a lawyer and the insurance company can bring in their lawyers to determine the level of damages. But in any event, the person is compensated for the intangible losses on a first-party basis.

Mr. MARKUS. Of course, this is what you are doing now. The only additional factor you are adding—

Mr. SUTCLIFFE. You are not quite doing it now when—

Mr. MARKUS (continuing). Is the fault factor.

Mr. SUTCLIFFE (continuing). Forty-five percent of the people who make claims recover, and their recoveries are not uniform.

Mr. MARKUS. Now, I understand you better. If your question is do we think it would be wise to have legislation that in some fashion pays the total economic loss and in some other fashion pays the total human loss for everybody, the answer is yes.

So that you can have no misunderstanding about this, what we are saying is if you are going to have some method in which everybody gets paid everything, we see no problem with that. But the difficulty is to date our society is not willing to pay everybody for everything. Therefore, it must divide the society into those that it finds more meritorious and less meritorious. The more meritorious get paid everything, the less do not.

Mr. SUTCLIFFE. If you submitted your first-party claims, for intangible losses to a jury and argued the case, do you think there would be different degrees of recovery for those intangible losses even if they are on a first-party basis?

Mr. SPANGENBERG. I have such a strong feeling, I have seen some cases where the drunk wraps himself around a tree at 90 miles an hour, he really ought to hurt on his own time.

Mr. SUTCLIFFE. What about the jurors making those awards, would they agree with that?

Mr. SPANGENBERG. I think they will, but we don't know.

Mr. SUTCLIFFE. From the standpoint of your expertise in international systems and looking towards what kinds of compensation systems have been developed, I wanted to get your reaction to that kind of a proposal.

Mr. SPANGENBERG. My experience has certainly been—and judges today, because in many of the other countries they have a judge trial system where the judge tries the fact as well and makes the award—I think the experience of all of us was when it comes to compensating

intangibles the trier of the fact, be he judge or jury, does seem to come out with numbers that reflect the real guilt or the real innocence.

Mr. SUTCLIFFE. Gentlemen, I am now going to beg your indulgence and ask to play the numbers game in terms of statistics so that we can understand what element of the population of injured victims we are concerning ourselves with when we try to draw the line as to where we will allow tort action for recovery of intangible losses.

Let me direct you to your testimony where you say that Senate bill 945 will be fair to perhaps 1 percent of all injured victims and unfair to 99 percent.

Mr. SPANGENBERG. That is a conservative number.

Mr. SUTCLIFFE. Let's analyze that if we can on the basis of the information we have and see why our comparisons are somewhat different.

In your appendix you explain that the 1 percent figure was arrived at through discussions with people involved in processing workmen's compensation claims.

Mr. MARKUS. In part. That confirmed other data.

Mr. SUTCLIFFE. You were using figures for injured workers, then, rather than an injured driver?

Mr. SPANGENBERG. We were using DOT figures on how many people in the injured automobile accident victim population of the United States might approach your 70-percent permanent partial disability figure.

Mr. SUTCLIFFE. Then let me address you to the final report which has been provided for you if you do not have it with you. It is the white book there on the table.

Table 6 lists the type of permanent injury as to fatality, permanent total disability, permanent partial disability, permanent disfigurement, all the permanent injuries, and the paid claimants constitute various percentages; as you can see from the table which we will put in the record at this point.

(The table follows:)

*Table 6—Percentage distribution of paid personal injury claimants by type of permanent injury*

<b>Type of permanent injury :</b>	
Fatality .....	1.0
Permanent total disability .....	.2
Permanent partial disability .....	4.0
Permanent disfigurement .....	2.5
No permanent injury .....	92.4
<b>Total <sup>1</sup> .....</b>	<b>100.0</b>

<sup>1</sup> Detail does not add to total due to rounding.

Source : Automobile personal injury claims, p. 19.

Mr. MARKUS. I think this confirms what we said.

Mr. SUTCLIFFE. Let's carry through and see if we can use this to confirm what you have said so that the committee can understand your figures.

Now, let me ask you, is it possible to extrapolate from table 6 to the total injury population and assume that of the population not paid, which is half the population, that the same ratio of injuries and types of injuries are occurring?

Mr. SPANGENBERG. We would think so.

Mr. SUTCLIFFE. If anything, it is favorable to the comparison because these people who are guilty and don't recover under tort may have been the drunken driver, and those involved in the more serious accidents. We don't know, but that is a possibility.

So, if we have a 50-50 breakdown, then the ratios we have before us remain the same and constant for the entire injury population; is that correct?

Mr. MARKUS. Assuming, I have got to make an assumption here, and the DOT makes the assumption, too, assuming that the DOT data here is reliable, and they recognize they have very little basis to make these statements here, as to what percentages were permanent total disability, those are objective judgments.

Mr. SUTCLIFFE. If you can submit data to us which refutes these and provides better data, please do.

Mr. MARKUS. I am willing to accept them for purposes of discussion, certainly. They are all we have.

Mr. SUTCLIFFE. This shows as to fatality, 1 percent of the population suffered fatality; as to permanent total disability, 0.2 percent; as to permanent partial disability, 4 percent; as to permanent disfigurement, 2.5 percent. These are the permanent injuries.

Nonpermanent injuries were 92.4 percent.

Mr. MARKUS. So you are suggesting that 7 percent instead of 1 percent is really fair.

Mr. SUTCLIFFE. Let's start with that approach. We don't know—

Mr. SPANGENBERG. As a quick statistical answer, as soon as you say 70 percent permanent partial, almost everyone of those people would be considered industrially or in any other way total disability. If you get over 70 percent, you have to be totally blind.

Mr. SUTCLIFFE. Let's assume that the intent, if not the execution, of S. 945 were to cover the permanent injuries.

Mr. SPANGENBERG. Then, it is totally different.

Mr. SUTCLIFFE. But let's then—

Mr. SPANGENBERG. That is only 95.8 percent who were not.

Mr. SUTCLIFFE. Bear with me, because I am very new at this analysis.

Let's take away the 4-percent permanent partial disability, because S. 945 clearly covers fatality, permanent total disability, and permanent disfigurement.

Mr. SPANGENBERG. Irreparable disfigurement, which means you are going to have lawsuits over whether or not plastic surgeons with seven proceedings can cause correction of a disfigurement.

Mr. SUTCLIFFE. I want to get a general picture of what we are covering and what we are not covering and at what point we might draw the line. In fact, because I have figured it out on the basis of a permanent partial disability coverage, which I think was the intent, if not the execution, the recovery for permanent injuries of S. 945—

Mr. SPANGENBERG. The original bill did.

Mr. SUTCLIFFE. The original bill introduced did, and there was some difficulty in defining permanent partial that caused the initial placing of it at 70 percent. We will not debate that issue; we will simply explain that at this point.

This means on the basis of permanent injury 7.6 percent of injured victims are under the Hart-Magnuson bill capable of recovering for personal injury.

Mr. MARKUS. I can't accept those numbers; you will forgive me. It mechanically sounds right, but then we have to know whether you are saying any permanent disfigurement or permanent serious and irreparable disfigurement.

Mr. SUTCLIFFE. We have assumed that we are covering the permanent injury.

Mr. MARKUS. All right. In that case, I would say that if you are counting injuries and deaths, that is a correct number.

Mr. SUTCLIFFE. That is permanent injury?

Mr. MARKUS. Yes.

Mr. SUTCLIFFE. You would compare that 7.6 as the fair portion?

Mr. MARKUS. Fairer, certainly.

Mr. SUTCLIFFE. We are working with that 1-percent-99-percent formula. You would compare that to the 92.4 percent as being unfair. OK. But it seems to me at that point you are comparing apples and oranges. The 7.6 percent would more appropriately be compared if you are judging fairness to those injured victims who suffer intangible losses that your organization itself judges compensable under your definition of compensable loss that you provided our committee, or even if we don't—I don't want to argue that that was something that you absolutely support; that may have been a suggestion for modification of language. But let's assume we have to make a comparison of the 7.6 percent that we cover not to the total injured population but to those likely to have any legitimate intangible loss claim.

Mr. MARKUS. Mr. Sutcliffe, it is impossible for me as a lawyer who sees injured people to say that someone who does not have a permanent injury, as you have described it, does not have a serious loss.

Mr. SUTCLIFFE. I am not arguing that point with you. I am trying to get the perspective of what you have covered here and what you want us to cover and how far apart we are. You are saying that our distance is 7.6 to 92.4 percent. I am suggesting that the distance is much less than that. I am suggesting our distance is 7.6 percent compared to the amount of those claimants in the injury population who are likely to suffer intangible loss.

Let me work from that point.

Mr. MARKUS. A hundred percent of those people suffered intangible loss. The only question is whether some of them are small enough that the society is going to make them bear it themselves.

Mr. SUTCLIFFE. The DOT study shows that seriously injured accident victims constitute about 12 percent of the total injury population.

Mr. MARKUS. That is by their definition of serious disability.

Mr. SUTCLIFFE. Wait a minute, please. I recognize that, I understand that.

Mr. MARKUS. It is a word of art, their language.

Mr. SUTCLIFFE. Would you explain that word of art?

Mr. MARKUS. Sure. It is set forth in the economic consequence study right in the beginning. It is defined to be not what someone thinks is serious but it is defined to be "medical costs excluding hospital bills of \$500 or more, or 2 weeks or more hospitalization, or"——

Mr. SUTCLIFFE. Let me stop you right there, 2 weeks or more of hospitalization. That was the 14-day line that you drew when you submitted to us suggestions for language for the definition of compensable

loss. So, we are not that far apart when we are talking about where the lines are drawn. All right.

Mr. MARKUS. You will find the definition on page 9 of the study.

Mr. SUTCLIFFE. Let's assume that that is at least a ball park guess as to the number of claimants in the injured population that suffer intangible loss that our society at this point in time deems compensable. We will certainly admit that that might not be, because some people who suffer the loss of both eyes, one day hospitalization and virtually no other cost, would not be compensable under that definition.

So under that definition 12 percent are seriously injured. We recognize that there would be people who exceeded that who a jury might not consider meritorious. But there would be a trading back and forth.

If this is so, by the logic of your own argument, S. 945, the Hart-Magnuson bill, which is picking up 7.6 percent of the 12 percent, is really covering 63 percent of the intangible loss that we have deemed for this discussion to be deserving of compensation. The ratio is 7.6 percent of the injury population compared to 12—

Mr. MARKUS. Why don't you want to cover a hundred percent? Why is it a determined effort to give some people injustice? I don't understand.

Mr. SUTCLIFFE. We have just agreed that some losses are so small that we would ask them to absorb it.

Mr. MARKUS. We simply said if that is your goal that you should take that approach, but you should not simply exclude the consideration that these people are suffering.

Mr. SUTCLIFFE. Let's say our goal is to cover intangible losses for seriously injured accident victims which seemed to be what you were telling us we were not doing. What I am trying to find out is how far have we come and how far do we have to go to cover the seriously injured accident victim.

Mr. SPANGENBERG. The only difference between us is in communicating in words. When we say there are people who are hurt, who have serious and intangible losses, you say serious means what DOT said it meant in their definition. That isn't what we meant really. I think if a man has to stay out of work for—

Mr. SUTCLIFFE. Would you provide for this committee a definition of seriously injured victim and that definition would be the label to trigger recovery for intangible loss?

Mr. SPANGENBERG. Sure.

Mr. SUTCLIFFE. You have already done this apparently with the information you have provided us previously in the draft that Senator Hart has read into the record. If we used that test, I suggest to you that our 12 percent of the entire injury population is a very accurate or it is a very close approximation of the number of people that we would recompense for intangible loss.

Mr. MARKUS. I don't agree with that conclusion.

Mr. SUTCLIFFE. Perhaps for the record you could explain the points of disagreement, and I would be more than happy to develop with you any areas where communication as to what we were discussing has broken down.

Mr. MARKUS. Do you want me to do that now? I didn't understand. Was that a question?

Mr. SUTCLIFFE. If you feel capable of that now, sir.

Mr. MARKUS. I will do the best I can.

As Mr. Spangenberg pointed out, your 12.5 is based upon a work of art called serious injury in the definition given by the Department of Transportation. As I tried to read before from page 9 of the study, that is "2 weeks or more of hospitalization, or, if working, 3 weeks or more of missed work, or, if not working, 6 weeks or more of missed normal activity."

Those standards are all considerably stronger than the standard we suggested might be a conceivable standard. So, I must say, instead of 12.5 percent, I would anticipate you are talking about something in the nature of 25 percent or 35 percent or something perhaps in that category.

Mr. SUTCLIFFE. The point still remains that, when you make your comparison of what percent of the Hart bill at this point is fair and what percent is unfair, you yourself should be obliged to consider that element in relation to the injured accident victim population which reflects those people who would be eligible for the recovery of intangible loss.

Mr. SPANGENBERG. I will speak off the top of my head and probably regret the words for the rest of my life.

If you start out that some people are not hurt very much and maybe the system can absorb not paying them anything for their intangibles, maybe the crude approach is half of them are hurt bad and half of them are hurt not very much and pay the half that are hurt badly. So the halfway figure I think I could get out of the statistics very easily.

If they have total economic loss—hospital, doctor, medical, and lost time, or in the case of the housewife the loss of equivalent days that the worker would have temporary disability—that would amount in total to, I think on the DOT studies, about \$150. That is your halfway figure. It will be a very small number.

If you want to go half and half with us, I think we would consider that.

Mr. SUTCLIFFE. On page 41—I think this is responsive to the point you make—the DOT final report, the average payment for recovery in tort for a nonpermanent injury is \$830. The average economic loss was \$333. So, for the record, if we used the Department of Transportation's definition of seriously injured—if we used as a line to be drawn permanent injury versus nonpermanent injury, on the average we would be asking the population to give us \$497 worth of intangible loss, the difference between the average economic loss and the—

Mr. SPANGENBERG. I follow you. Right.

Mr. SUTCLIFFE. So that gives us at least a monetary measure of what we would be asking society to do.

Mr. MARCUS. I am not sure, Mr. Sutcliffe, and maybe some caution should be exercised here. I believe a good deal of the data we are looking at from the Department of Transportation only relates to people who are already classified as serious injury cases.

It may be that 100 percent of these people are classified as seriously injured people under the standard that I have described.

Mr. SUTCLIFFE. You are correct. In table 13 they are classified as seriously injured, but there is a breakpoint between permanent injury and nonpermanent injury. That is the drawing line I was trying to get.

We are talking on an average of asking a person to give up \$475 of intangible loss recovery. I am trying to focus for the hearing record at what level we are approaching.

Let's focus on what S. 945 covers. Through the tort liability system it permits the recovery of tangible and intangible loss not covered under the first-party provision for all types of permanent injury with the problem of the 70 percent permanent-partial which the committee has recognized. Through its first-party coverage it covers almost all economic losses of all victims.

Mr. MARKUS. May I stop you for a minute?

I think there is a fundamental error. The statistic that we have heard described over and over again, that the person who has the grievous injury with over \$25,000 economic loss, is only getting 30 percent of his payment. He is going to get 32 percent under the Hart bill, because the change that is made for wage repayment extends only for 30 months or even 36 months under the House form, and that is where the loss is.

The DOT study shows it is all in future losses, and you are not covering many of those. So as a practical matter, you are not helping that situation significantly.

Mr. SUTCLIFFE. I have tried to calculate what percentage of the total economic loss would be covered by the Hart-Magnuson proposal using the Department of Transportation statistics. So, let me present that to you and get your views on this.

On page 1 of the economic study, it is reported that only 0.5 percent of the seriously injured accident population had economic loss exceeding \$25,000. The seriously injured population constitutes, as we have explained before under the definition of the Department of Transportation study, 12 percent of the total injured accident victims.

Thus, on those figures, figuring it with a \$25,000 cutoff instead of the \$30,000 wage replacement cutoff that it is, to be conservative, S. 945 would not cover the economic loss in 0.6 percent of the cases involving injured accident victims. Conversely, it would cover the economic loss in 99.4 percent of all bodily injury cases.

Mr. MARKUS. I think, as you said, you have been playing numbers as you started this discussion. What we are saying is the people who now have protection without this law are still going to be protected. Those that do not now have protection, that is that same very small percentage which is something less than 1 percent, you are still not going to protect.

Mr. SUTCLIFFE. Everyone who operates a vehicle will be required to have this basic economic loss protection. Everyone would then be compensated for their economic loss except 0.6 percent of the injured accident victims.

Mr. MARKUS. That is the same—

Mr. SPANGENBERG. You are very light on the fatality side from my general experience in the field.

Mr. MARKUS. That would be about 1 percent, I think.

Mr. SUTCLIFFE. That is the economic loss recovery for the person whose losses exceed \$25,000 in economic loss.

Mr. MARKUS. The same people.

Mr. SUTCLIFFE. The Hart-Magnuson bill covers 99.6 percent of that economic loss.

Mr. SPANGENBERG. Your first-party benefits are the best in any no-fault bill that has been introduced in the United States.

Mr. SUTCLIFFE. So we are at a point now——

Mr. MARKUS. Mr. Sutcliffe, I think I am not communicating. Maybe I should try to make this clear, though I agree with Mr. Spangenberg that the first-party benefits are the best that have been introduced, we should not fool ourselves by pretending that you have solved the problem that you described, in which people with more than \$25,000 economic loss are only getting 30 percent of their economic loss reimbursed.

That is not going to be changed under this. Those are future wage losses that are beyond the 3-year interval.

Mr. SUTCLIFFE. And that accounts for 0.6 percent of the injured population?

Mr. MARKUS. Today and later.

Mr. SUTCLIFFE. Let's compare the economic compensation for the person who has \$25,000 worth of damage now to what the Hart-Magnuson bill would provide.

Mr. SPANGENBERG. Why should we? What you are saying in the Hart bill is go out on a compulsory basis and buy first-party health and accident benefits and pay for them out of your pocket, and once you have bought it and paid for it, you will get the benefits.

Mr. SUTCLIFFE. That's it.

Mr. SPANGENBERG. If you wish to do that, we are here saying we are not quarreling with that approach.

Mr. SUTCLIFFE. Let me say why it is important to make a comparison of what the proposed legislation covers and what the existing situation covers. It has been claimed that the Hart-Magnuson bill is heartless. At the present time for people who have claims of economic loss of more than \$25,000, their average recovery would be 30 percent of the economic loss.

Mr. SPANGENBERG. Are you talking about under the tort liability system?

Mr. SUTCLIFFE. Yes.

Mr. SPANGENBERG. If you want to be fair about that, shouldn't you add the amount they now recover under first-party benefits that they are already carrying?

Mr. SUTCLIFFE. And for the \$25,000 economic loss that brings it up to what, around 40 percent or around 45 percent?

Mr. SPANGENBERG. Something like that.

Mr. SUTCLIFFE. If you will provide that for the record.

That comes from life insurance, social security, and other forms of compensation.

Mr. SPANGENBERG. Medical pay, disability insurance, and so forth.

Mr. SUTCLIFFE. Would you agree, then; that under the proposal before us we have covered 99.6 percent of the people who will experience economic loss?

Mr. SPANGENBERG. You have compelled people to by first-party health and accident insurance to cover the loss.

Mr. MARKUS. I suggest you get better coverage——

Mr. SUTCLIFFE. One hundred percent coverage?

Mr. MARKUS (continuing). If you just required them to buy a life insurance policy. You get better economic response to the numbers that

you are describing if you simply said everybody must buy a life insurance policy at \$50,000 for operating an automobile.

You would get a bigger impact on those same numbers that you are talking about.

Mr. SPANGENBERG. That would take care of the fatality cases immediately.

Mr. MARKUS. Numerically those are the biggest numbers.

Mr. SUTCLIFFE. In terms of what is being covered now under the Hart bill for intangible loss, at the upper end of the spectrum in the permanent area there is coverage and there is an absence of coverage below that point to some unknown where society might determine that intangible loss is not necessary to cover, and your recommendation to this committee is to move the line as has presently been drawn down to some point to cover those intangible losses?

Mr. MARKUS. No, it is not. It is our recommendation to this committee that you not have a line and that there be full compensation for everybody that is an innocent victim now.

But if you are determined to have a line, we suggest that you have drawn it at the wrong place.

Mr. SUTCLIFFE. Are you suggesting that the present lines that are drawn in the tort system where for the economic loss of \$500 that four times the economic loss recovered for intangible losses is appropriate for the full compensation.

Mr. MARKUS. As the Department of Transportation itself pointed out, the relationship between the medical expense or economic loss and the severity of the injury is one of the most illusory things that can be stated, that it is almost meaningless.

I can cite to you—in fact, that is one of the great problems in the Massachusetts statute—I can cite to you people with really tragic injuries who do not have medical expenses of \$500 and people who have medical expenses of \$500 who have trivial injuries.

Mr. SPANGENBERG. I have had people blinded for less than \$500. The boy with the traumatic amputation didn't have large medical bills.

I am suggesting if he has \$400 in medical bills to repair a stump for a lost arm, I am not going to be shocked if he got four times that as his payment for intangible losses, and all that kind of cases go into your average number.

Mr. SUTCLIFFE. But you mentioned the Massachusetts situation where they were using the bodily injury claim to pay for property damage. How do we avoid that kind of situation while allowing for the interest that you want to protect?

Mr. SPANGENBERG. Have compulsory property damage insurance. You end the problem immediately. It makes as much sense to have compulsory collision insurance as compulsory bodily injury.

Mr. SUTCLIFFE. Would you make it compulsory or would you take away the tort remedy for the automobile and let the individual opt to insure or not insure?

Mr. SPANGENBERG. Then you are going to create the same kind of problem. I say be blunt about it, have compulsory collision insurance and then take away the tort remedy if that is what you think you ought to do.

Mr. SUTCLIFFE. I apologize for spending as much time in questioning, but I hope this has been productive.

Mr. SPANGENBERG. It is valuable to us because it clarifies your thinking, and I hope it makes us clarify ours. And you have given us some work assignments to do to furnish information to you which we will get on and furnish.

Mr. MARKUS. May we say we stand ready at any time to work with the committee or the committee's staff, if they want any additional information, to try to supply it. We think perhaps we can be of help to this committee.

Senator HART. Let me thank you both for your patience. It has been a long morning, I know. The committee will, I am confident, give thoughtful consideration to every argument which you have raised.

Having said that, I will plead just as my law school classmate pleaded when he started, I have a built-in bias, too. I hope that the decision of this Commerce Committee in response to these arguments will be basically the same decision that the Department of Transportation's conclusion was when, I am sure, Mr. Spangenberg made the same arguments, because he was a member of that study, to them.

You didn't persuade them and you haven't persuaded me, but you have sobered me. How the committee will react I don't know.

Mr. MARKUS. May I say, Senator Hart, that the final report of the Department of Transportation does not direct the language of Senate bill 945. That is from sources otherwise. It is not derived from the report of the Department of Transportation. You may have used some of the data in reaching the conclusions that you thought were appropriate, but certainly Senate bill 945 is not a bill that has been drafted by the Department of Transportation in its language, form, or substance.

Senator HART. Right. The Department of Transportation has recommended to the Congress that we go to a no-fault system and we do it fast.

Mr. SPANGENBERG. And that you preserve the right of the victim to sue in the tort system, and they said the cutoff was if they had an economic loss of more than \$1,000. I argued, over there, \$500.

Senator HART. How we draw that line is an issue that you clearly presented to us this morning.

Mr. SPANGENBERG. You are very gracious to thank us, Senator Hart, for responding to what we consider a very great privilege indeed to be allowed to come here and address you.

Senator HART. Senator Cook, who had to go to meet an earlier commitment, as he left, asked me to introduce for the record at this point the resolution adopted by the Kentucky State Bar Association with respect to the several bills that are under consideration, S. 945, S. 946, S. 947, and S. 948, and the resolution expresses opposition of the Kentucky bar to each of those bills.

So, I might as well throw in the editorial of the *Louisville Courier Journal* of April 26 which disagrees with the Kentucky Bar Association.

(The resolution and editorial follow:)

#### RESOLUTION

Whereas, the Kentucky State Bar Association at its annual convention held on April 22, 23, and 24, 1971, felt the need to explore the pros and cons of the No-Fault Concept of insurance which has become a matter of national importance and the subject of proposed legislation in the Congress of the United States, Senate Bill Nos. 945, 946, 947, and 948, and other state legislatures throughout the country, and

Whereas, the Kentucky State Bar Association feeling the importance to properly acquaint its members with all relevant facts and possible results incident to the No-Fault Concept has notified each member of the Association of the study undertaken at the annual convention; and

Whereas, the study undertaken by the Kentucky State Bar Association at the convention assembled has established the following facts:

1. That the major premise for the introduction of the No-Fault Concept, that is congested Court dockets, depriving the litigants of a proper trial, does not exist in the Courts of the Commonwealth;

2. That the No-Fault Concept destroys incentive for safety, and, therefore, highway accidents will increase and excepted conduct will be replaced by irresponsible highway conduct, resulting in higher accidents on the highways of the Commonwealth of Kentucky;

3. That the Concept of No Fault is alien to the Judo-Christian heritage of this country that one must be responsible for his carelessness or negligent conduct involving other citizens.

4. That the No-Fault Concept will sacrifice the constitutional rights of the aggrieved citizen to have his rightful redress in Court;

5. That the No-Fault Concept discriminates against the poor, the blue and white collar workers, the frugal citizen, the young and those on fixed incomes who could not afford to fill the many gaps for insurance protection caused by the No-Fault Concept;

6. That the No-Fault Concept denies a citizen of his full right to recovery for pain and suffering, for disfigurement, disability and the monies lost as a result of being denied his right to pursue his gainful employment;

7. That the limited experience where No-Fault has been adopted clearly demonstrates an *increase* in the premium to be paid by the average citizen in order to obtain *less* protection;

8. That payments under this concept would be indiscriminately made to all citizens, to the sober and the drunken, the careful and the careless, the responsible and irresponsible and to the honest and the dishonest regardless of merit and oblivious to fault;

9. That the limited experience where No-Fault has been adopted clearly demonstrates that the inept language, complicating legislation and friction between insurer and insured by low benefits results in more claims and more lawsuits, further encumbering the dockets of the Courts; now, therefore, be it

*Resolved in convention assembled*, That the Kentucky State Bar Association, through its membership, goes on record as denouncing the No-Fault Concept of Insurance and specifically the proposed legislation in the Congress of the United States promoting the concept, as being violative of the American way of life and as hereinabove set out detrimental to the rights of the individual citizens, and further

*Resolves*, That a copy of this Resolution be made available to Senator John Sherman Cooper, Senator Marlow W. Cooke, all United States Congressmen of the Commonwealth of Kentucky, and the Governor of the Commonwealth of Kentucky so that its contents may be known to them and they may take the necessary action appropriate to their commensurate position to prevent the enactment of legislation implementing the No-Fault Concept, and further

The Kentucky State Bar Association dedicates itself to continuing its efforts to further implement the ideals set forth in this Resolution to prevent the inequities being exacted upon the citizens of the Commonwealth.

Passed this 22nd day of April, 1971.

ALLEN SCHMITT, *President*.

[From the Louisville Courier Journal, Louisville, Ky., Apr. 28, 1971]

#### COULD LOSING LEGAL FEES EXPLAIN BAR'S STAND ON AUTO INSURANCE?

As a general rule of thumb, when an organized group starts condemning something as a threat to the "American way of life" it's often instructive to see whether its target also might be a threat to the group's pocketbook.

A seeming case in point is the Kentucky Bar Association's condemnation of "no-fault" automobile insurance the other day as un-American and "detrimental to the rights of the individual citizen."

Specifically, the KBA and other legal groups opposing the no-fault concept are saying that it would deprive people of the right to sue for damages for "pain and suffering" as a result of an auto accident; that other "benefits" now available would be lost. One of those "benefits": high legal fees.

Simply stated, the "no-fault" approach means that insurance liability claims would be paid without considering who caused the accident. That is what happens now in other forms of automobile insurance—collision, for example, and "comprehensive," which protects the insured against theft, fire, glass breaking, vandalism and other hazards.

So why the resistance to extending the no-fault principle to auto liability insurance?

One reason is that the legal profession stands to lose a great deal if the present system is abandoned. In 1969, 16 cents of each \$1 of automobile bodily injury liability premiums went to claimants' lawyers fees. Another 2 cents went for court costs. Looking at it another way, in 1968 parties to auto accident litigation spent \$600 million in legal fees, and this amounted to one-fifth of the legal profession's income.

#### THE MASSACHUSETTS PLAN

An acquaintance with these facts can help the average American make a better appraisal of no-fault insurance, and discredit some of the negative arguments in what has become a real scare campaign.

The basic purpose of no-fault is to reduce litigation and speed up payments of claims, which is why we buy insurance in the first place. There is the further possibility that the no-fault approach will cause soaring premium costs either to come down or at least level off.

Supporters of no-fault don't contend that it is a perfect solution; only that it is better than what we have now. Indeed, there are a number of different no-fault plans.

Massachusetts, for example, has a limited no-fault law covering personal injuries but not property damage. It provides automatic medical benefits of up to \$2,000; pays up to 75 percent of loss of wages and salary; and allows no benefits for pain and suffering unless medical payments are more than \$500 or in cases of death, dismemberment, loss of sight or hearing, disfigurement, or fracture.

A better plan is the one now before Congress—the Uniform Motor Vehicle Insurance Act. It would set national standards and cover most personal injury costs. Those it didn't cover would be left to liability action through the courts.

This plan also would pay all medical costs not compensated by other insurance or programs; replace lost income up to 85 percent of salary or \$1,000 a month, whichever is less, provide cash payments of up to \$30,000 for surviving dependents of a wage earner who dies as a result of an auto accident; and allow no pain-and-suffering benefits. The no-fault proposals that permit unlimited lump-sum payments for pain and suffering are far less generous in other benefit categories.

This may not be a perfect plan. But it's infinitely preferable to what we have now, in its ability to deliver benefits when they're needed and in a less expensive and wasteful fashion. Federal legislation also is the answer, despite the Nixon administration's urging that each state act on its own. The latter course would take years longer because the insurance lobby always has had more clout at the state level.

As for the alarms expressed by the legal profession that the no-fault approach will leave those responsible for accidents unpunished, we believe this is an exaggerated fear. Those who are the cause of this kind of accident have often violated criminal laws, and they can be prosecuted regardless of how the victims are compensated.

**Mr. MARKUS.** We had one from the Cleveland Plain Dealer which agrees with the Kentucky Bar Association.

**Mr. SPANGENBERG.** I can give you a resolution of the Negligence Committee of the Ohio State Bar Association. But I hope, Senator Hart, you appreciate that we have not come here to oppose or to support S. 945 because we find that the bill has some good features and some bad. I hope our criticism has been directed only to those portions which we oppose and that you appreciate that we do support a good deal of the philosophy of that bill.

Senator HART. I am sure the record makes clear that that is the tone of the testimony.

(The statement follows:)

STATEMENT OF RICHARD MARKUS, PRESIDENT, AMERICAN TRIAL LAWYERS ASSOCIATION

Mr. Chairman, we appear before this committee on behalf of more than 25,000 lawyers, judges and law professors of the American Trial Lawyers Association. Our Association has traditionally fought as the people's advocate, the consumer's ally, the polluter's enemy, as the lawyer for the individual victim of our industrial society. Several members of this committee will remember the vigorous support by our Association for numerous consumer safety measures which would attack manufacturer indifference to safety—a program that necessarily reduces the number of cases and the legal fees available to our members. During the course of this testimony, we will outline our affirmative recommendations for reform, many of which will mean less legal fees for our members but which will fulfill the same objectives of the Hart-Magnuson Bill without taking away the legal rights of citizens.

By contrast, we must conclude that the principal supporters of the so-called "no fault" proposals are insurers that conspire to make greater profits at the expense of every motorist. After initial opposition to the "no fault" concept, some segments of the insurance industry changed their position overnight and jumped on the bandwagon in a desperate last-ditch effort to preserve and improve their profit-structure, while they make a last-ditch effort to prevent true social reform. We submit that the "no fault" concept has been misrepresented to the public and that there is not and has not been any public "ground swell" for "no fault" programs.

The Public Opinion polls demonstrate clearly that the majority of the electorate does not want a plan like the S.B. 945. When the University of Michigan Survey Research Center sampled public opinion for the Department of Transportation, they asked people what features of the present automobile insurance system were undesirable. The complaints were overwhelmingly about the industry practices: Cancellations, Non-Renewals, Raising Rates after a Claim, Insufficient Differentiation in Rates Between Good and Poor Drivers and Rising Costs. S.B. 945 is only incidentally involved with these complaints. Only 2% of the people dissatisfied with the present system made voluntary reference to the fault system. (D.O.T. "Public Attitudes" Report, Table III-2, p. 24)

When people were asked whether there should be a change in the present system of paying only when the injury-causing driver was *alone* at fault, 68% answered "No." When the minority 32% were asked what change should be made, 10% said that payment should be made without reliance on fault, but just as many (10%) said that comparative negligence was the proper change to adopt, making payment inversely proportional to fault. (D.O.T. "Public Attitudes" Report, Table VII-S1, p. 125). It is significant that none of those persons polled on this question volunteered the suggestion that the system ought to be changed by eliminating payment for general or intangible damages such as compensation for loss of sight, hearing, or other functions.

It is true that other questions in the survey indicated that for sufficient cost savings a substantial number of people would be willing to forego damages for "pain and suffering." The term "pain and suffering" is insurance company jargon for general damages, but to the public it means the physical sensation of pain, as other surveys have shown. A citizen might forego damages for the physical pain when a sharp piece of glass pierces his eyeball, but it is not conceivable that he would give up compensation for the loss of sight of that eye.

Indeed there is evidence to suggest that the majority of people do not realize what "no fault" is nor the extent to which the proposed "no fault" program would take away their civil rights. The most recent Gallup Poll showed that only about 4 out of 10 persons had ever heard of "no fault" and only about 18% surveyed were acquainted with the principal features of the "no fault" proposals.

Let me state the five legislative goals of my association, which relate to this subject. First, we seek affirmative social reform to help all victims of all accidents and injuries—a meaningful program of general national health insurance. Indeed, when such a program is adopted by this Congress, there will be little or no reason to discuss an automobile health insurance program called "no fault." We see no justification for greater public concern over the drunken driver who sus-

tains self-inflicted injuries than for the hapless housewife who falls down the basement steps or the innocent cancer victim. We believe that such true social reform should be funded by the general population. It should not be supported by a regressive victim taxlike "no fault" insurance which takes money away from the innocent in order to pay benefits to the guilty. It may be worth noting that national health legislation would probably mean a major reduction in legal fees, yet we support it. Its most bitter opponents are those same insurance companies that are terrified by its potential impact on their profit structures.

Second, we continue to seek state legislation which would provide greater equity for the relatively innocent victims of auto accidents. Thus, we have sought and continue to seek an elimination of the antiquated contributory negligence rule, and realistic liability insurance limits. We have sought and will continue to seek an elimination of meaningless immunities that render drivers free from responsibility to their guests, family members free from responsibility to their loved ones, and governments free from responsibility to their citizens. It is most curious that the very insurance companies that complain about inequities in the present legal system have been the traditional antagonists who have lobbied against every one of these reform measures to help the innocent victim.

Third, we have sought and continue to seek greater efficiency in the administration of claims. Although court congestion is largely a local matter in certain key metropolitan areas, we actively support arbitration, non-unanimous verdicts, and smaller juries in the less disastrous cases. We favor realistic quotas of judges based on population so that our courts can meet the staggering criminal docket and have some time left for the civil docket. We endorse legislation that would encourage insurers to make early payments long before any law suits, and we support legislation that would impose burdens on the tardy insurer by making interest run on those unpaid obligations at an earlier time.

Fourth, we ask government and industry to act more forcefully to bring about safety measures which would halt the carnage on our highways and reduce high claim costs and automobile insurance premiums. The public is demanding real legislation that will rid our highways of drunken drivers, require meaningful repeated operator examinations so that a driver's license is not a license to kill, and stiffen the backbone of courts by legislation that will require repeated traffic offenders to forfeit their licenses.

Finally, we seek greater economy and a realistic reduction in automobile insurance premiums. Insurers supporting the "no fault" plan are infected with the virus of wishful thinking when they make unrealistic and unsupported claims about supposed premium reductions. We charge that there is no truly reliable actuarial study to support the claimed premium reductions, that there is a good reason to believe that there would be major premium increases, and that any premium reductions obtained would be the result of reductions in benefits paid to innocent victims. Instead, we ask for realistic measures that will reduce the frequency and severity of human losses and property losses from highway havoc. Several years ago the president of a leading automobile insurer pointed his finger at the real problem when he said at a stockholder meeting, "What the industry needs most is a good five-mile-an-hour bumper for automobiles." Automobiles can be designed to withstand a ten-mile-per-hour impact without any significant damage. In contrast to the \$320 damage that a 1971 vehicle sustains in a five-mile-per-hour impact. Highway design for safety is not a textbook dream. Sensible titling laws can slash the frequency of auto thefts by making stolen cars less saleable. Although we have received some comfort from cooperation by part of the insurance industry in supporting these measures, we are sad to report that many insurers do nothing more than complain about the real source of rising insurance costs.

Neither legal nor insurance gymnastics will ever provide a lasting reduction in insurance premiums. Premiums can be cut only when we cut the losses, and that is the only humane way to approach that task. Remember that at least two-thirds of every insurance dollars goes to pay for sheet metal and glass, property damage—not flesh and blood, and personal injury. Most "no fault" plans do nothing to meet the property damage problem.

Then why do we say that the "no fault" proposals are a poor substitute for these reform measures? Why do we label them "retreat" rather than reform? A critical analysis of key sections of S.B. 945 is attached to this statement. Basically, we believe S.B. 945 addresses itself to guaranteeing easy defenses and easy profits for the insurance companies, but does not address itself to providing justice for millions of innocent victims of careless, reckless, bad driving. Every

other major nation in the free world has adopted a system of compensating automobile accident victims which provides medical payments and disability payments for all victims of every kind of accident, and, in addition, guarantees that in automobile accidents the innocent victim of another's bad driving will receive full compensation for all his injury, including payment for temporary or permanent disability, disfigurement, loss of function, and suffering. In these other countries, the payment of medical expense and disability benefits to the victims of all accidents—whether automobile, household, recreational or any other kind—is treated as a broad social problem.

It is government insured and government funded, simply because any type of universal social or welfare insurance can be handled at lower cost by the government. It would be as unthinkable to have compulsory private-company health and accident insurance as it would be to have compulsory private-company Social Security. The traditional tort system has been retained, and without exception, gives full justice to the innocent victim, requiring payment for all those intangible human losses incorrectly called "pain and suffering" by the American insurance industry.

The United States, which up to now has claimed to have the utmost respect for each individual citizen as a distinct person, would now dehumanize a special class of its citizens—automobile accident victims—and turn them into plastic people suitable for uniform processing through the insurance industry's computers.

For example, under S.B. 945, if a good driver on his own side of the road is hit head on by a reckless speeder on the wrong side of the road, he will not receive any payment for the destruction of his body if he loses any of the following: 1. one arm at the shoulder, 2. one leg at the hip, 3. the sight of one eye, 4. his total hearing in both ears, 5. total immobilization of his entire spine from head to tailbone for life. The crippled victim has no claim for bodily injury unless, under Section 2(9) of the Hart Bill, he sustains a permanent partial disability of at least seventy per cent, which would require the loss of at least two extremities, or both eyes. Even the loss of both hands by a young man would not be classified as 70% permanent partial disability by many authorities. It is unfair to pretend that the Hart Bill does allow some traditional tort recovery for serious bodily injuries and then qualify the standard so that an innocent man who is half destroyed by his injuries cannot make any claim at all.

S.B. 945 will be fair to perhaps 1% of all injured victims and unfair to only 99%. Half-Pay, "No Fault" plans pretend they are truly just and fair to each individual citizen.

The chief claim of the proponents is that they are cheap—or can be if the benefits are kept small enough. How cheap "No Fault" will be depends on how much will be paid. It is obvious that premiums could be reduced as much as two-thirds if the insurance company paid out no benefits at all, spending the whole premium for commissions, salaries, overhead and reserves.

The American Trial Lawyers Association is indeed concerned about the cost of insurance, but it is even more concerned with the value the consumer will get and the quality of justice each citizen will receive.

The American Trial Lawyers Association cannot endorse the Administration's position reported by Secretary Volpe. His request for a nebulous "sense of the Congress" resolution calling for some undefined legislation and threatening some unstated Federal retaliation denies the essence of any Federal government. Further, to the extent that the Administration appears to endorse alleged compromise "no fault" legislation, it is asking us all to compromise with injustice. We see no reason to seek retreat instead of reform. We see no reason to seek a "little" injustice when we can have complete justice. We oppose "no guilt insurance" that simply trades your rights for someone else's wrongs. With "no fault" insurance, you pay more and get less—less equity, less justice, less reparation for pain, suffering and economic loss. Only the guilty will get their money's worth.

In summary, we do not object to welfare-oriented, social-security style, first party-health and accident benefits plans. Motorists ought to be allowed to buy all the health and accident insurance they want. We would support without hesitation a national health insurance plan. We do question whether all drivers should be compelled to buy health and accident insurance from private insurance companies at whatever rates they choose to set, without government control over those rates.

We do vehemently protest against any plan which is deliberately designed to take away a substantial part of the compensation the innocent victims rightfully deserve in order to create a fund to pay the bad drivers who injured them. It is not the American faith to create injustice for the deliberate purpose of depriving the innocent, crippled victims of bad driving. The driver or passenger who is in the right should not be penalized for the benefit of the driver who is in the wrong—nor for the benefit of private insurance carriers. S.B. 945 is unjust, not because of the limitation on benefits it gives, but because of the rights it takes away.

In conclusion, we appreciate this opportunity to present the position of the American Trial Lawyers Association in regard to S.B. 945 and all other proposed no fault programs—a position we believe is strongly in support of consumer rights. While the objectives of this bill—to reduce costs, to speed up claims and to provide automobile victims quick benefits—are all laudable, the enactment of “no fault” will not fulfill these objectives. Several weeks ago, Justice Thomas C. Clark, former Attorney General and U.S. Supreme Court Justice, characterized the “no fault” plans as “no fair for the public.” We agree with him.

We are not against change, but we are against untested and hastily designed change just because change is needed. We are confident that the program of national health insurance and court reform supported by our Association represents a positive and practical solution to the problem within the framework of the present tort liability system.

#### ANALYSIS OF KEY PROVISIONS IN SENATE BILL 945

The following analysis of Senate Bill 945 is pertinent to our position and to the inherent weaknesses of the bill itself.

1. Section 2 (9) defines the term “catastrophic harm” to mean death, permanent partial disability of 70% or more, or disfigurement that is “permanent, severe and irreparable.” Since this is the term which authorizes any remedy beyond the first-party insurance provisions, its significance is obvious. Unless the standard provided by this definition is met, there will be no compensation for disability, disfigurement, dismemberment, prolonged intractable pain, or loss of enjoyment of life. Further, as a later section makes clear, unless the standard specified by this definition is met, there will be no compensation for economic losses involved in lost earning capacity (which is explained below as differing markedly from the wage replacement provisions of the Act) or the portion of wage replacement not provided by the Act (also explained below).

A standard of 70% permanent partial disability would exclude at least 99% of all injured motorists, according to all data available to us. We know that the D.O.T. found that only 2/10th of 1% of motor vehicle victims sustained an injury which caused a loss of earnings that extended beyond 2 years. Discussions with persons involved in processing workmen's compensation claims indicate that substantially less than 1% of injured workers are found to have more than 70% permanent partial disability. Although there could be some difference of opinion as to the extent of disability which meets that standard, certain recognized reference sources give us some guidance. By reference to the official publication of the American Medical Association, we find that the following conditions are each rated as constituting less than 70% permanent partial disability; amputation of the leg at the hip, amputation of the arm at the shoulder, 100% restriction of spine movement. See “A Guide to the Evaluation of Permanent Impairment of the Extremities and Back,” A.M.A. Journal (February 15, 1958). The International Association of Industrial Accident Boards and Commissions would rate the loss of an arm at the shoulder or a leg at the hip as less than 70% permanent partial disability for any person 53 years old or younger. That same Association would rate the following conditions as constituting less than 70% permanent partial disability, regardless of age: loss of hearing in both ears, loss of an eye. See Bulletin of the United States Bureau of Labor Statistics No. 359, Page 17.

The term “catastrophic harm” is also defined to include disfigurement that is “permanent, severe and irreparable.” With modern plastic surgery, there are very few disfigurements that cannot be substantially improved—if enough plastic surgical procedures are undertaken. In some cases, there may be 20–30 subsequent surgical procedures. One wonders whether they would leave a condition that is considered to be “permanent, severe and irreparable,” since there would

be no compensation whatever for all the human loss that occurred up to the point in which the surgical improvement was sufficient to remove it from that description.

This standard is drastically more severe than the standard imposed by any workmen's compensation statute—anywhere in the United States. Every state workmen's compensation statute provides payment for permanent partial disability in recognition of the human losses and the loss of earning capacity (discussed below). This statute effectively ignores all such losses.

2. Section 2(10)(C) defines economic loss to include "an amount equal to 85% of the monthly earnings at the time of the injury or \$1,000, whichever is less . . . provided, however, that in the case of injuries such period shall not exceed 30 months (36 months in the House Bill 7514)." This means that the insurance provided by the statute would not pay 15% of the income loss sustained by any victim, would not pay any income loss beyond the maximum period of 30 months (or 36 months), would not pay any income loss exceeding \$1,000 per month, and would not pay any income loss beyond the pay rate at the moment of injury.

Presumably, the 15% reduction was based upon an attempt to recognize federal income taxes which would reduce the employee's earnings and which would not be charged against these payments. For people in larger income brackets, that might be extremely favorable. However, for people in lower income brackets, this represents a drastic reduction in the amount of income which would be replaced. Based on 1971 federal income tax rates, a married man with three children who uses the standard deduction would not pay 15% of his total income as taxes unless he earned at least \$18,000 per year. Since people in those earning brackets typically have higher deductions than a "standard deduction" (interest on house payments, other taxes, etc.) most people earning less than \$20,000 per year do not ordinarily pay as much as 15% of their total income as federal taxes. This means that most Americans, and *particularly lower income Americans*, will receive substantially less than their full wage replacement under this Bill. Of course, those who earned more than \$1,000 per month will not receive that excess under the insurance provided by the Bill.

In addition, there will be no payments after the expiration of the statutory time limit of 30 months (36 months). This might not seem significant, since we know that every, very few people will lose wages consistently from the time of the accident for 30 to 36 months thereafter. However, many people will sustain injuries will cause them to lose wages in a subsequent period of hospital care or disability, long after they have returned to work. In other words, there will be many people with serious injuries who have an initial period of disability and lost wages, who then return to work for an extended period of time, and who subsequently are again forced to have disability and lost wages. If that ultimate period of disability extends beyond the 30 months (36 months), there will be no payment from the insurance provided in the act. To our knowledge, no workmen's compensation statute in the United States is this severe.

Finally, the most drastic denial of payment for economic loss relates to loss of "earning capacity." Any person who is temporarily unemployed or earning at a rate lower than his usual income will have his wage replacement frozen at the rate he was earning when the accident occurred. Thus, a student, a housewife, a retired man with occasional jobs, or a man between jobs will receive nothing for lost wages—since they were not earning anything at the time of the accident. If a man is at a temporary job with a lower earning rate, he will be frozen at that earning rate for the future period of lost income. We cannot imagine a more cruel method of determining income loss. This language is a drastic change from the language previously used in Senator Hart's bill in the last Congress (Senate Bill 4339) which provided for wages that would have been earned over that future time interval. This change has a particularly horrendous effect on lower income groups who are often in the unpleasant circumstances of being "between jobs."

3. Section 2(12)(A) provides that the insurance benefits provided by the Act will be excess above "any benefit or payment received, or entitled to be received . . . under any private or public insurance or plan or other source of benefits (with stated exceptions discussed below)." This means that all fringe benefits that have been earned by union members through difficult bargaining struggles, as an alternative to wage increases, will be pirated to reduce the insurance company's payments. The union member who has earned these "fringe benefits" by his sweat will have them deducted from his insurance payments when he is injured. In effect, he will pay for the same benefits twice, and receive them only

once. This applies to all union-negotiated health benefits, wage continuation plans, or hospitalization plans. In fairness, it should be recognized that a group policy written under the provisions of this statute might permit some slight premium reduction where such fringe benefits exist (usually estimated by proponents at 6%-8% on the personal injury coverage only). If that occurs, the very slight reduction will still not counterbalance the loss of benefits for very substantial premiums that are being paid.

4. Section 2(12)(A)(v) provides that the insurance under the Act will not be excess over "any private or public insurance or plan or other source of benefits" if that other source explicitly provides that the insurance described in this statute will be paid first. As a practical matter, this could not have any meaning for a substantial period of time during which all other insurance policies covering the same losses would have to be rewritten. When that rewriting eventually occurs, it is obvious that the premiums for the insurance provided by this statute would go up. In that situation, the premium provided by this statute would no longer be a parasite on other insurance and the costs would have to reflect the fact that it was standing on its own two legs.

Reliable estimates establish that medical expenses represent 53% to 61% of all economic losses of motor vehicle accident victims. Therefore, when the medical expense part of the economic loss is removed entirely from the automobile insurance policy, only a minority of the economic losses would be covered by this statute. We have reason to believe that the health insurance companies want to hold onto this part of the market, so they will try desperately to make any national health program provide benefits that are *excess* above the automobile insurance coverage in this statute. This means that any savings in administration that is obtained by national health insurance will be lost for the automobile insurance injuries, so those companies can continue to make their profits on those injuries.

5. Section 3(b) forbids any state to require liability insurance by a compulsory insurance law or a financial responsibility law. When we see that in Section 5(b) liability insurance is an optional coverage for the insured, this means that there will be no federal or state requirement that anyone carry liability insurance of any kind. Therefore, the right to obtain damages for "catastrophic harm" are not only limited but meaningless, since they must be collected from someone who does not carry any liability insurance at all. So, his right to collect for "catastrophic harm" could well be a cruel hoax.

6. Section 4 is the "tort exemption" section that prohibits any recovery beyond the basic insurance provided by the statute unless there is "catastrophic harm." This means that unless there was at least 70% permanent partial disability there would be no right to seek any recovery for economic loss beyond the statutory amounts (wage loss not covered by the statute, loss of earning capacity) and no ability to recover for the human losses of disability, disfigurement, dismemberment, long periods of pain, or loss of ability to carry on life's pleasant activities. As explained in the discussion of Section 2(9), this is a grievous restriction on the ability of the innocent victim to obtain full payment.

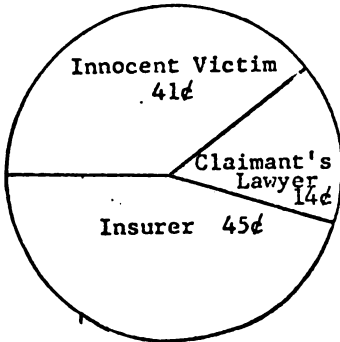

7. Section 5(a)(7)(A) direct the Secretary of Transportation to establish higher premium rate classification for commercial vehicles larger than passenger cars, in accordance with their higher injury-causing propensities. As we all know, busses and trucks cause more injuries and pay higher premiums today. This Section was removed entirely by Congressman Moss from House Bill 7514, creating a major subsidy to the trucking and bus industry. Obviously, without such a provision, all other motorists will pay higher premiums to absorb the amounts that are no longer being paid by these larger commercial operators.

8. Section 5(b) describes the "optional" catastrophic harm liability insurance. As explained before, this means that no one will be required to carry liability insurance. This Section also provides for a meaningless uninsured motorist coverage. The uninsured motorist coverage permits the insurance company to provide an optional insurance for the motorist that would pay him for "catastrophic harm" losses if he is struck by an insured motor vehicle. However, the term "uninsured motor vehicle" is defined by Section 2(2)(B) to be a vehicle that does not have the insurance required by the statute. In other words, if someone carried the required first-party insurance and no liability insurance whatever, he would be an *insured* motorist, so the uninsured motorist provisions would be inapplicable.

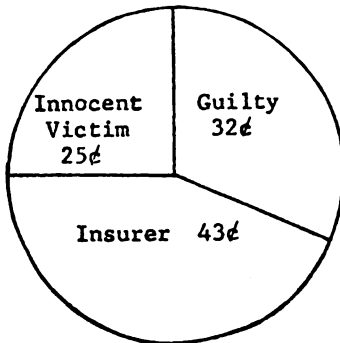

9. The impact of this legislation will be particularly drastic for low income and poverty sectors of our society. Such persons are commonly operating uninsured cars, even in compulsory insurance states because they can't afford to pay insurance premiums. With this legislation, they will lose virtually all third-party

protection as tort victims, and they will be denied any first-party protection Section 5(A) (3)A—they will have no protection. Those who seek to draw a parallel to workmen's compensation forget that employee benefits are an automatic incident of employment, but auto insurance is not an automatic incident of operating a car.

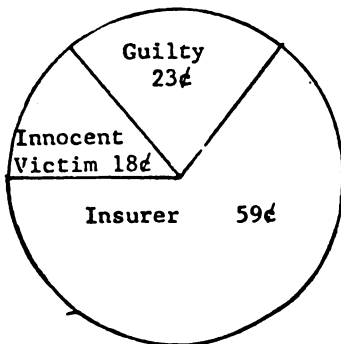

WHERE THE PREMIUM \$ GOES

TORT SYSTEM

"NO FAULT"  
(AIA VERSION)

"NO FAULT"  
(MASS. 3 MONTHS  
EXPERIENCE)

## NOTES TO EXHIBIT

The Exhibit reflects the distribution of the premium dollar under specified conditions. For the "tort system" the payment of \$.55 per premium dollar is reflected in the actuarial studies "Report of Special Committee to Study and Evaluate the Keeton-O'Connell Basic Protection Plan and Automobile Accident Reparations (New York: American Insurance Association, 1968), Exhibit 1, Sheet 2". The "claimant's lawyer's portion of \$.14 is derived as 25% of gross loss payments. See D.O.T., *Economic Consequences*, p. 48, Professor Keeton estimates the net paid to victims as 44% of the total premium, so the values suggested here are conservative. See D.O.T., *Final Report*, p. 51.

For the "no fault" (AIA version) the portion of the premium attributable to loss payments and insurer operations are reflected in the same study by the American Insurance Association referred to above. The division of payments between guilty and innocent victims correspond with the conclusion by the DOT that only 45% of seriously injured victims obtained any compensation from the tort system. DOT, *Economic Consequences*, pp. 3, 37. Seriously injured persons consistently made a higher percent of claims and a higher percent of serious injuries led to some payment. DOT, *Economic Consequences*, p. 49. No portion of the premium dollar is allocated in this example to claimant's lawyers, although it is presumed that some expense would be incurred for that purpose. For these reasons the share allocated to the innocent victim may well be overstated.

The last drawing depicts the Massachusetts experience. It is derived from the same data and considerations described above, together with the report by Governor Sargent as to loss payments for the first three months of 1971. See New York Times, April 24, 1971. Loss payments decreased 36%, though premiums had been reduced only 15%. Thus loss payments were 35.2% of the prior premium level (64% of 55%), or 41% of the new reduced premium level (33.5% divided by .85). That 41% can again be divided between innocent victims (45% to 41%) and guilty (55% to 41%). Again, the share of the innocent victim is probably overstated because no share has been allocated to fees for claimant's attorneys.

Senator HART. Apologizing to others who have sat here this morning, I regret that we will have to recess. I have a luncheon that was arranged largely at my request with some mayors, and it has been in session for 35 minutes, and I simply must attend.

Let me suggest a recess until 2:30 p.m.

(Whereupon, at 12:50 p.m., the hearing was recessed, to reconvene at 2:30 p.m., this same day.)

## AFTERNOON SESSION

Senator HART. The committee will resume.

Senator Cook has asked that we continue and hopes very much to be able to get here before you conclude. He would join me in welcoming all of you.

May I suggest that you proceed in any fashion that you find most expeditious.

**STATEMENTS OF EDWARD W. KUHN, PAST PRESIDENT, AMERICAN BAR ASSOCIATION, MEMPHIS, TENN.; JUDGE JOHN T. REARDON, CIRCUIT COURT, QUINCY, ILL.; LOUIS G. DAVIDSON, PAST CHAIRMAN, ABA SECTION OF INSURANCE, NEGLIGENCE, AND COMPENSATION LAW, CHICAGO, ILL.; AND THOMAS E. DEACY, JR., KANSAS CITY, MO.**

Mr. KUHN. Thank you so much, Senator Hart.

May I introduce the panel of the American Bar Association. This is Judge John T. Reardon seated to my immediate right. He is chief judge of the 8th judicial circuit, Quincy, Ill. He is immediate past pres-

ident of the National Conference of State Trial Judges. He represents the American Bar Association.

Seated to his right is Mr. Thomas Deacy of Kansas City, Mo., chairman of the Special Committee on Automobile Accident Reparations of the American College of Trial Lawyers.

To my immediate left is Louis Davidson of Chicago, Ill., immediate past chairman of the Section of Insurance Negligence and Compensation Law of the American Bar Association.

My name is Edward W. Kuhn of Memphis, Tenn. I am chairman of the Section of Insurance Negligence Compensation Law Special Committee To Achieve Justice Through the Adversary System.

We have been designated by the president of the American Bar Association to appear before you on this important subject.

I might explain to you briefly what the American Bar Association is. It is composed of approximately 150,000 lawyers, judges, and law professors. It is the largest legal organization in the world. We have a house of delegates composed of 291 members representing all of the State bars, most of the large local bars, and approximately 20 or 21 affiliated organizations. Therefore we think that because of the composition of our house of delegates we can speak authentically for the entire legal profession in the United States.

We have had a vital interest in the auto insurance, this so-called legislation pending in Congress and we have given it much attention. A committee was appointed several years ago and we composed a report which was submitted to the house of delegates and was approved unanimously, that is, our recommendations were approved unanimously by the house of delegates and, of course, that represents the position of the American Bar Association.

We treated this subject very comprehensively from practically every angle and we had 38 meetings of 2 days' duration each, so I assure you that we have given this serious and very, very close attention because it is so vital to the general welfare of the people of this Nation.

We adopted a resolution. The fundamental principle, and I will read it to you because I want it to be clear, is as follows:

The present system for providing reparations for those injured in automobile accidents, based upon the concept that if there is no fault there is no liability and relying upon an adversary method of trial before a court or jury as the means of determining liability and the amount of damages be retained as the basic legal structures for dealing with such cases but that the following proposals for further study, changes in, additions to, and modifications of such system should be further considered.

Then our report of approximately 250 pages, which I understand has been filed with this committee, contains about 60 committee recommendations for improving the present tort system.

We have recommendations as to the delay in the courts. Twenty-four of those recommendations, we think, can improve court procedures.

There are recommendations as to the substantive law, seven in number.

There are recommendations as to the law of damages in automobile cases, four in number.

There are recommendations as to certain categories of persons who are injured in automobile accidents, three.

Recommendations as to cost, eight.

Recommendations as to automobile insurance, four.

There also are recommendations to deter dangerous driving, promote highway safety, and so forth.

Senator HART. Mr. Kuhn, for the record, the report to which you make reference has been provided the committee and is a part of our files.

Mr. KUHN. Thank you so much.

I won't go into all of those recommendations because I understand each of our witnesses is going to take only about 5 minutes of your time. We think those recommendations contain the lawyers' plan to solve this problem.

Our general objection to no-fault legislation is that there is no great public demand for a change. We are familiar with and cognizant of the surveys conducted by the Pennsylvania Chamber of Commerce, Market Facts, Inc., the State Farm Mutual Insurance Company, insurance agents, Drake University, the University of Michigan, which has a very fine survey as you Senators are well aware, the Minneapolis Tribune and even the Department of Transportation has indicated that the majority of the public are satisfied with the present system.

We think these surveys are the answer to the criticism that our position may be in the interest of the lawyers individually.

We think that before any legislation of this type is enacted that the public should be given the information as to what they are giving up. For instance, their claims for pain and suffering, for loss of life's pleasures, inconvenience, loss of limb, disfigurement, hearing, consortium, prenatal injuries, impotency, right to catastrophic losses and many other losses, in return for a certainty of payment of some of their hospital bills and some loss of earnings.

We think the no-fault plans—and I will not single out a particular one but we are addressing ourselves to your particular plan, Senator—discriminate against a large segment of our population such as the housewife, the minor, the elderly, the disabled, the unemployed, the married man with a large family and many other segments.

We think they are also discriminatory against the laboring men who have their own health and accident protection. They have these collateral benefits. Many of these plans would limit the amount of recovery in proportion to the amount of the available collateral benefits available.

There is no proven certainty that costs to the premium-paying public will be lowered. We think that most of these no-fault plans would require a person to carry two policies, one for no-fault and one for fault.

There are many claims by the actuaries and our studies show that they are in fundamental disagreement. Many eminent statisticians contend that the costs will increase under a no-fault plan.

The no-fault plan will have great impact upon the industry itself. You will find that a great many of the small and efficiently run companies will pass out of the picture because only the giants can have the facilities and can withstand the rating uncertainties and the retraining of personnel and all of that under a no-fault plan.

We do not accept the contention that automobile cases are clogging the courts. We have gone into that question very closely. We had

several judges on our committee, one of them being Judge Reardon, and Judge Horace Gilmore from Detroit whom the Senator may know.

Senator HART. Indeed I know him.

Mr. KUHN. He was on our committee.

We think that as far as the courts are concerned there are other culprits more prominent than the automobile cases. For instance, the criminal cases and all of these facets such as habeas corpus and so on. We don't think that there is anything to the argument that automobile cases are clogging the courts.

It would be difficult for any lawyer to leave this subject without some comment that goes beyond the economic realities involved.

The law, and all those involved in it, can view with reasonable pride the advances in individual rights which have been made in the last 20 years. That a correlative growth in individual responsibility is often lacking seems all too obvious.

A large part of the American population has abandoned the belief that one is responsible in the next world for what he does here. We are now busy considering plans which will tell the same people that they aren't even responsible in this world for their actions.

All the present no-fault programs contemplate one further abandonment of individual responsibility.

It is our position, briefly, that the present system should be retained. But recognizing its inequities and deficiencies we have made 60 specific recommendations on how it can be improved and we think with the improvements it can serve the American public.

Thank you so much, Senator, for allowing me to speak.

Senator HART. Thank you.

I was struck by your suggestion that in addition to those who are insisting that there is no ultimate responsibility, that this is part of a package to relieve temporal responsibility.

Mr. REARDON. Mr. Chairman, Senator Hart, I too want to express our appreciation for the opportunity to appear here. I would like to mention that in 1968 the Special Committee on Automobile Accident Reparations of the American Bar Association began its study and evaluation of the existing system of providing reparations for those injured and damaged in automobile accidents. This system is one based upon the concept that if there is no fault there is no liability and relied upon an adversary method of trial before a judge or a jury and judge as a means of determining liability and the amount of damages.

After extensive inquiry, research, and public hearings the committee determined that the fault concept should be retained as a part of the legal structure for dealing with these cases, but that numerous modifications should be considered. Mr. Kuhn has covered these recommendations and I will not repeat them.

I suggest to the committee that they are all contained in the report which you have received into evidence here.

About 2 weeks ago the American Bar Association appointed a new special committee to work in this area. Its purpose is to assist in presenting the association's views on this subject and to cooperate with interested sections and committees of the American Bar Association and with State and local bar associations to bring about enactment of legislation to improve automobile accident reparations procedures.

The American Bar Association is the major voice of lawyers in the United States. Despite evidence that may have been previously given, the American Bar Association does not have a closed mind to the frailities and defects of the existing system. At the time of the report of the American Bar Association Committee on Automobile Accident Reparations the extensive research that has been provided by Congress to this committee was not available.

The change that is being suggested by the pending legislation is a drastic one, and reasonable men, whether they be legislators or lawyers, or both, will approach the plan with caution.

It is unquestionably true that backlogs do exist, particularly in metropolitan areas. It is also true that in some metropolitan areas (Miami, Fla.), and in less urban areas of the country, there are no appreciable backlogs. There are hundreds of trial courts around the country which are as current as they should be.

In these areas, efforts that were previously made to speed up procedures are being slowed down because there is such a thing as a trial court being too current. (Determination of injury permanency cannot be made and counsel have had insufficient time to prepare.)

A typical example of this situation may be found in the State of Illinois where an enormous backlog exists in the metropolitan area of Chicago, but in the area of downstate Illinois, where approximately one-half of the 10 million people of that State reside, there are no worrisome backlogs in the trial courts.

Trial judges throughout the United States vary in their judgment as to the percentage of judge time that is required to handle tort cases. I have an uneasy feeling about the statistics in this area. They vary so greatly they seem to lose credibility.

Some judges feel that as much as one-third to one-half of their judge time is used in handling tort cases. Other judges disagree.

Studies were made in the superior court in Boston which indicate that automobile accident cases did not represent as substantial a part of the trial calendar as was believed. In my own case, and in my own court, we estimate that 50 percent of judge time is used in the handling of criminal cases. Domestic relations and automobile accident cases share secondary importance.

Trial judges cannot help but wonder as to the preoccupation that seems to be attached to auto accident cases since the same concern does not seem to exist for other tort cases and for criminal cases.

It would seem to me that if we are going to enter into a program that will make whole the victims of automobile accidents, then logically we might well consider a more comprehensive plan involving the health, medical expense and loss of employment of all accident victims. Individually, many of us who oppose such a broad concept wonder as to the validity of preferring the victim of the automobile accident.

As an individual I cannot bring myself to the point of saying that I oppose no-fault plans. We already have no-fault plans in our system. Collision insurance and medical pay are examples.

If no-fault plans will work and if the cause of justice is served, then certainly judges throughout the United States will support them.

I would like to emphasize that the American Bar Association has an open but troubled and critical mind on this issue. The appointment of this committee is an evidence of its concern.

The American Bar Association has in the past, and I am sure will in the future, respect its solemn obligation to the advancement of the public interest.

It is in the great American legal tradition to support even unpopular causes if they contribute to the public welfare. Surely, reason and prudence direct us to proceed cautiously. Let us learn the results in Massachusetts. Let us withhold judgment until after sufficient time has elapsed and ample experience has been gained for reasonable people to formulate considered judgments.

I certainly am no expert in the field of no-fault as distinguished from fault concepts, but I am convinced it is foolish to believe greater benefits can be provided at a lesser cost.

I also am concerned about the distinction that is made in most plans between the small and the large case. This would seem to me to require two types of protection—one, a first-party type to cover the small claim, and, second, the policy to cover possible losses suffered within the tort system. It seems doubtful that this would be less expensive.

I would be the last to suggest that traditional methods of operating courts have not contributed to court delays. There are many of us who have, for years, urged and worked desperately to modernize and speed up judicial procedures to the end that we can cope with the ever-increasing volume of work. It seems to me that the suggested proposal is one that will provide lesser benefits at a lesser cost.

Again I say I do not disagree with this concept, but I do disagree with those who would sell this proposal to the people on the theory that they are going to get something for nothing.

I also find it difficult to agree with the idea that the fault concept is not relevant to damages or injuries arising out of an automobile accident.

It is my impression that juries do act as the community conscience and are able to reach reasonable judgments in this regard, and it seems to me that even the proponents of the no-fault system must agree with that because they recommend the retention of the jury trial system for the more serious types of automobile tort cases.

The same can be said of the proponents again with respect to suffering and pain. They would eliminate it from the small case as an element of damage, but they would retain it for the more serious case. Somehow or another this logic escapes me.

Although I was a member of the American Bar Association Committee on Automobile Accident Reparations, I do not agree with their failure to recommend the Philadelphia arbitration plan. This plan will reduce delay in the disposition of claims and will relieve the court of congestion.

My inquiry causes me to believe that the plan works extremely well and that few cases are appealed for trial de novo, and of those appealed most are settled without trial.

Certainly we can urge the adoption of the comparative negligence doctrine of Wisconsin and eliminate the doctrine of last clear chance and assumption of risk.

As was recommended by the American Bar Association Automobile Accident Reparations Committee, we should do away with charitable, governmental, and intrafamily immunities where they exist. We should have mandatory liability insurance with realistic limits.

I personally feel that we should require increased first-party medical payment coverage. A \$2,000 amount to encompass loss of wages to be deducted from any future award would have a chilling effect on subsequent legal action.

We certainly cannot continue the unfortunate automobile guest statutes which came into being as an overreaction to instances of collusion. We should insist that uninsured motorist coverage be included in our policies.

Most important of all, we should realize that in a sense we are dealing only with the symptoms of the problem that besets us. The language of Justice Blackmun in a recent concurring opinion in the Supreme Court of the United States (*Tate v. Short*) highlights this thought. He was speaking of using jail sentence as punishment for traffic offenses. He said :

Eliminating the fine whenever it is prescribed as alternative punishment avoids the equal protection issue that indigency occasions and leaves only possible Eighth Amendment considerations. If, as a nation, we ever reach that happy point where we are willing to set our personal convenience to one side and we are really serious about resolving the problems of traffic irresponsibility and the frightful carnage it spews upon our highways, a development of that kind may not be at all undesirable.

Our sincerity should motivate us to tighten up on the issuance and renewal of drivers' licenses and make examinations for drivers' licenses meaningful. Should we consider implied consent laws on a national level? Should we insist upon State implementation of the requirement of the National Highway Safety Act?

Our actions here may test and grade our sincerity to the cause of safety on our highways and may relieve us of some of our concerns in the field of reparations.

Senator HART. Thank you.

I think for the record it would be useful if you would state briefly the nature of the jurisdiction of the court over which you preside.

Mr. REARDON. It is a court of general jurisdiction. It is the Eighth Judicial Circuit in Illinois. It comprises an area in west-central Illinois about 120 miles east and west and about 110 miles north and south. It has eight counties in it. We have 11 judges and four magistrates in our circuit.

Senator HART. Thank you very much.

Mr. DEACY. Mr. Chairman, my name is Thomas E. Deacy, Jr., of Kansas City, Mo. I am a practicing lawyer, a member of the American Bar Association, a fellow and regent of the American College of Trial Lawyers, and chairman of the special committee on automobile accident reparations of the college. I am honored to appear here with the distinguished representatives of the American Bar Association.

The American College of Trial Lawyers is an honorary association of trial lawyers from each of the 50 States numbering approximately 2,300. Fellowship in the college is extended by nomination and election in a highly selective process. Membership is limited to 1 percent of the lawyers in each State and in most States is less than that.

The membership of the college includes lawyers who represent both plaintiffs and defendants, lawyers who handle litigation in all fields in trial and appellate courts and administrative tribunals, both civil and criminal.

The scope of advocacy practiced by the fellows of the college extends far beyond the tort reparations field. The college addresses itself seriously to studies and reports concerning matters which relate to the public concern and the administration of justice.

Last year its report and recommendations on disruption of the judicial process set the pace for a reasoned approach to the protection of the rights of both the criminal defendant and the courts.

The college's concern with problems relating to the public interest and the impact of the law upon the public prompted its study and report and recommendations on automobile accident reparations.

This report, Senator Hart, I believe, has been furnished to the committee and I ask that it be included in the record.

Senator HART. It has been received and will be made a part of the record by reference.

Mr. DEACY. The report and recommendations of the special committee on automobile accident reparations were approved by the board of regents of the college on March 11, 1971, and ordered printed and distributed among the fellows and other interested persons. I offer the report for the record of this hearing.

The basic recommendations of the report include study of Senate bills 4339, 4349, and 4341, then pending in the 91st Congress.

The basic recommendations of the committee were against the adoption of any of the current proposals for auto plans and firmly opposed to the intrusion of Federal law into the area.

As to the latter, we believe that the States are important laboratories for social experiment in the field of auto reparations. We believe that evaluation of auto plans involves assumptions about costs, claims consciousness, fraud, deterrence, settlement behavior, lawyer behavior—upon all of which experience with actual operation will shed some light.

The change from the common law to a plan would be irreversible and it would be imprudent to change the tort and insurance law everywhere in one single giant step.

We found compelling each of several considerations against current auto plans:

1. We are not persuaded that auto accidents present a case requiring special treatment and departure from the principles which control in other common law tort situations.
2. We see no reason to single out the auto accident for treatment as a special case requiring social insurance.
3. We believe that any plan will either cost more or lower substantially the benefits the accident victim may now receive at common law.
4. We firmly believe that the tort law still has a substantial role to play in the moral culture of our society; that the public should not surrender lightly the principle of personal responsibility in the auto case.
5. We believe that the public should be fully apprised of the effect of the proposed shift from the format of third party liability insurance to that of first party accident insurance and the fact that such a shift would transfer the cost burden from the individual as an accident creator to the individual as an accident victim.

May I add also that your candor, Senator, in the statements that preceded the introduction of your bill in the congressional bill acknowledges that there would also be a social shift of the cost of insurance from the low-wage earner to the high-wage earner, and the emphasis, of course, of the first party plans is that it is the risk of the person as an accident victim and not an accident creator which determines whether he is a good risk or a bad risk.

6. We believe that modification of the collateral source rule as an underpinning for the financing of an auto plan tends to conceal from the ordinary citizen that he may be getting back under a plan only the benefits of insurance he has already paid for.

7. We believe that the Massachusetts experiment may provide valuable experience for further study and evaluation.

8. Our recommendations against plans at this time include the two-level plans which preclude or diminish common law benefits. Their advantages are: they will cost more unless the award level is diminished so that even the person eligible to use the tort action left over will receive less than he would have at common law; that the tort actions left over will be trivial or the level of compensation to all victims will be trivial; that the criticized inefficiencies, fraud, arbitration and delays will remain and additional coverage will be required.

We believe that the negligence principle and the determination of fault are capable of judicial application and are being applied meaningfully to the auto accident. There is impressive agreement to this among seasoned lawyers and judges.

We also believe that pain and suffering or general damages for injury involving the elements of discomfort, inconvenience, limitation of earning capacity both present and future, disruption of participation in avocations and pursuit of pleasure, all make rational components of damages the availability of which makes the law more just and humane in its handling of personal injury.

A principal consideration against the plans is that they do not even purport to meet the major expense of the automobile reparation system, that of the cost of repairs to automobiles.

Approximately two-thirds of the premiums and loss payments go for the repair of damage to automobiles; thus, any plan which treats only the personal injury aspect of the problem relates to only one-third of automobile insurance expense.

As a strategy for reducing staggering property damage costs we enthusiastically recommend support for standards of automobile manufacture to eliminate property damage and injury resulting from low-speed collisions.

I understand that S. 976 has this purpose and we are wholeheartedly for it.

We found that the handling of the small claim is the target of most of the criticisms of the functioning of the system. They are overpaid due to the nuisance factor, the costs of processing them are disproportionately high, payments and costs are inflated by attorneys' fees, and they aggravate court congestion.

Each plan attempts to eliminate the small claim and thereby these problems. However, in so doing it would also irreversibly alter present tort remedies. We believe that these criticisms can be largely met, yet the benefits of the tort system be retained without increasing costs.

We recommend that the familiar medical payment coverage contained in approximately 80 percent of auto liability policies today be expanded and revised by State law as follows:

1. Offer of such coverage be made mandatory, perhaps even compulsory inclusion of such coverage.
2. Coverage be extended to the insured, members of his household, and passengers in his automobile.
3. Coverage be expanded to include wage and income loss as well as medical expense.
4. The limits for the combined medical expense and economic loss be set at \$1,500 per person covered; and I emphasize this is a strategy directed to the small claim.
5. The insured may reject such coverage, but only in writing. This provision applies in uninsured motorists coverage and only 2 percent of the people in California, and I assume of the other States, rejected it.
6. The insurer would be entitled to a credit for the amount paid pursuant to this coverage to any claimant who makes a tort claim against the insured or driver of the automobile covered by the policy.
7. The insurer would also have a lien, to the extent of payment under this coverage, upon any tort recovery that a claimant made against another person.

We believe that such reform of the automobile insurance system would have the advantage of affording more injured persons compensation for their whole economic loss. This would add little to insurance premiums and we believe that such additional costs would be offset by the savings which would result.

The number of small tort claims made would be substantially reduced. The injured person who recovered full economic loss would now be disinclined to engage an attorney and pursue a tort claim.

The lien which the insurance company has on any tort recovery to the full amount of the medical and economic loss paid would so diminish the value of the tort claim to the claimant or his prospective attorney that the engagement of counsel and the bringing of suit would be deterred. Court congestion would lessen.

As first-party claims, these claims can be handled with less expense than tort claims. Under this method the pressures to overpay the small claim would be reduced and the nuisance value factor would be largely eliminated.

This suggestion is a modest strategy to supplement the present system with an increase in first-party insurance which it is hoped will serve to mop up a major part of the small claims. The increase in insurance would be voluntary and the structure of the tort system would be left intact.

The change would not be irreversible. The expectation for improved efficiency in the system could be tested against experience.

The report also recommends further reform of the existing tort law—liability insurance reparations system and improvement of its administration in the courts.

We recommend changes by the States of the tort law, where applicable, designed to close gaps in compensation: the adoption of the comparative negligence doctrine of the Wisconsin type; the elimina-

tion of automobile guest statutes, and of charitable, governmental and intrafamily immunities.

If these changes are made, the only victims of automobile accidents who will not be fully compensated in tort are the driver of a car involved in a single-car accident and the victim who is himself the predominantly negligent party to the accident.

We are not persuaded that the protection of these two groups of accident victims from themselves warrants altering the basic architecture of the common law of torts.

To close solvency gaps we recommend that the States require that uninsured motorist coverage be mandatory in automobile liability insurance policies, that higher liability limits be required, and that the States adopt either compulsory liability insurance or an uninsured motorist fund.

As further suggestions for reducing the incidence of automobile accidents and damage, we enthusiastically recommend the adoption and enforcement of sanctions designed to prevent injury resulting from alcohol or drug-influenced drivers; the adoption by all levels of government of highway safety programs and the support thereof by the bar and the public; and the exploration of effective merit rating systems for automobile liability insurance to reinforce the deterrent effect.

As changes designed to improve the administration of the auto accident tort system in the courts, we recommend that each State adopt procedures for quick and economical handling of small claims such as mandatory arbitration, short cause, nonjury procedures as are being pursued in Los Angeles County, Calif., the expanded use of courts of inferior jurisdiction and small claims courts.

We also recommend that each State should, by court rule, provide for the regulation and supervision of contingent attorney's fees.

We are opposed to the imposition upon the people of abrupt and drastic change in the law of the various States by which they have long been governed—a drastic sweeping away of the tort and insurance law and regulations which have evolved over long periods of time through action of the legislatures and the decisions of the courts in the various States.

The proposals being considered by the committee would impose a new and untried system upon everyone, everywhere, in an area of the law with which every man is most likely to be affected.

The cost of the proposed system is unknown and incapable of determination. The loss of the benefits enjoyed by the innocent victims of automobile accidents under the present law is drastic. Yet, the change for better or for worse would be irreversible and the damages, if that be the result, would be irreparable.

We believe that change should be responsive to the demands and requirements of the citizens through the laws of their respective States, and that wisdom as to the direction and magnitude of change should be acquired through experimentation in the various States through which reform may evolve and directions may change according to experience.

And, from the information which Mr. Kuhn stated in respect to surveys, 94 percent of the people are satisfied with the fault system and feel that fault should be an element in the system.

On behalf of the American College of Trial Lawyers, I thank you for extending to us this opportunity to present our views.

Senator HART. Mr. Deacy, we appreciate your willingness and that of the College of Trial Lawyers to give us these ideas and voice these concerns. I take it now Mr. Davidson will speak?

Mr. DAVIDSON. Thank you, Mr. Chairman.

Thank you for the privilege of allowing us to appear here for the American Bar Association, and I will refrain as best I can from repeating anything that has been covered by the previous speakers, although I endorse what each of them has said.

I think it has become most manifest from what this committee has heard today and from all the reports flowing in that all the bar associations, judges and lawyers recognize that there are serious deficiencies in the present system and the real problem is how to remedy this without doing more harm than need be done.

I would estimate that probably 3 million claims a year are disposed of under the present system, Senator, and perhaps more. If you think in terms of perhaps 30 years, 100 million cases or claims, or more, have been processed in an ordinary way under the system of State case law, and statutes where there is a vast amount of know-how on the part of judges and lawyers because the people are accustomed to working under and live with and accept these procedures.

The problem is whether such a system, admitting its deficiencies, as any human-made system is bound to have, whether it should be discarded at one fell swoop for a system that is new and uncertain and untried.

Once you cast out the old, as has been said to you, it is very difficult to turn and retrace those steps.

I think a planned, orderly development enables us to use this experience and knowledge of mankind, to evolve in an ordinary way. As has been pointed out, one State has taken that action.

We have been advised, Senator, that about 27 States—and I don't know how reliable this statistic is today—have bills pending in the various legislatures dealing with various facets of the no-fault problem. I suggest we give them an opportunity to decide whether they want to take this step.

Admittedly, there are serious objections to a State approach to the problem because of a so-called patchwork that we might have in dealing with a problem of this nature. But, at the same time, we can learn from their work and experience if the States are given a chance.

I know the States have gone very slowly and I realize that the work of this committee and the DOT study has given impetus to what is being done in the States. I know the concern being felt at the State level. Things are now beginning to happen. You have, in effect, built a fire under them.

We don't know what the effect of this statute will be on the costs, but if you were to take out of the court system the so-called small cases, under \$3,000, which are estimated to encompass 70 percent, approximately, of the cases—and these are the cases that are the greatest burden on this present system, costwise, where it is hardest to justify keeping them in the present system—the question might well be asked, what will the effect be on costs if you take those cases out of the system, as they are doing in Philadelphia, and perhaps we can learn meaningful lessons from what is going on there.

It seems to me the other problem that may not have been given fair and due consideration is this. The jurors, in a way Judge Reardon described, function as the conscience of the community. Those of us who have worked within the system know that jurors have, in the past, set a standard for the courts and the lawyers and the insurance companies as to what the community believes is fair and just as to who should bear the responsibility and what is just compensation.

This tends to be lost, Mr. Chairman, if this is not adhered to as a way and method of doing business.

There is the hope—and I know this is implied—that some of the cost of this system can be reduced by taking the lawyers out of it, so far as possible. But I think this is not realistic for this reason, that the service rendered by the lawyers under the present system has resulted in recovery, on the part of clients who do have counsel, of a net recovery beyond that of injured persons who do not have representation. The workman is worthy of his hire.

No matter what system this committee shall recommend, and the Senate and the House may eventually adopt, if there is one, unless it be free from problems and questions, the public is going to need legal counsel and their services to protect their interests if they are going to get fair consideration.

We were studying with some care to try to see under the present bill what some of the problems are that will necessitate help of counsel on the part of the injured public. Whether plaintiffs or defendants; it wouldn't make any difference because they will all be claimants under the no-fault system.

We see the question, for example, Is the disablement for which a claim is being made, due to injuries caused by entering, alighting from, or being struck by an automobile, or during loading or unloading?

These questions have arisen, for example, under policies of insurance now in effect.

We must realize many of these are unwitnessed accidents. There may be single car accidents with no one else around to see what happened. A person may say, "I got hurt getting out of a car. I fell and broke my hip." There will be claims of this kind, inevitably.

What is the extent of the disablement? Is it great enough to entitle this person to a catastrophic loss recovery? This troubles us very deeply. First, the fact that it is a rare professional man, be it doctor, lawyer, judge, or Congressman, who can fall within the so-called 70 percent category of the loss. I don't know how anyone is going to say what that loss is, that you are 70 percent totally disabled.

Many a man with an education may have paralysis, have his body paralyzed, and still not have 70 percent disability. Peculiarly, under the law as being proposed, that injured person won't know whether he has a right to proceed with a claim based on negligence and fault unless he first tries out this question as to whether he has that disablement.

So he has to go through a trial of all these medical issues and then there has to be a determination by a jury or a court, and if they say that he now is disabled to a degree, 69 percent, then he is out. If he is disabled up to 70 percent, then he has a right to proceed and recover under a negligence action.

I do not see, frankly, despite a lifetime of experience in this work, I must say to the chairman, at what level this ought to be fairly pegged or how it could be worked out satisfactorily. You have this problem. A person has a serious and permanent disability or a severe disability and I think you might say in good conscience he ought to be allowed to recover for human pain and suffering, even though he hasn't suffered amputations.

But under this present standard as now written into the law, it would be very, very difficult to determine whether he has come within the provisions.

You have other questions that will arise. Is this man justified in staying off work? You know, Parkinson's law—I beg the Chairman's pardon for addressing you this informally.

The level of expenditures and time away from work tends to rise to the sum of money available to pay the bills. If you have a \$36,000 limit, who is to decide whether this person should go back to work or need to stay off as long as he says he must? Does he need rehabilitation, psychiatric help and care of one form or another? Shall he be entitled to elective surgery? Is it rendered necessary by this injury?

So you have an unbelievable number of elements that will require expert counseling to protect his rights, whatever they may be.

We are basically concerned with the fact that overall, the proposed bill tends to allow too little to too many, partly because of the effort to keep the cost down. Something is being taken away from others who might be entitled to recover, to compensate others who would have no rights.

Comparative negligence might help to some degree to meet the point raised by the committee that too many people are not compensated, and perhaps they should not be denied compensation merely because they were substantially to blame.

I think the foregoing, if I may briefly summarize, accelerates our reasons why we should hesitate to leap instantly from the present system to this completely new and untried system.

I realize the temptation to go on and not hesitate when you have reached a certain posture, but I respectfully urge that you wait and give the States a chance to try their hands and see what can be done.

I thank you again for the privilege of appearing before you.

Senator HART. Gentlemen, thank you very much.

I shall now confess that I am a member of the American Bar Association, but inactive.

Based on the testimony, I am not a very useful contributor. Your last point, not that it is the most important, but it sticks in my mind, is to proceed with caution.

We are fussing with an area where for generations, or for centuries we have been evolving a pattern in the general concept of torts and damages. At least wait before we apply a national program to see how the States come along and what the experience is.

There are two reactions to that. First, the track record on how States proceed, particularly in an area where there is such political pressure is wretched. That is just one man's opinion.

Second, the basic figures on performance of the existing system suggest we risk an uncharted course on the assumption that the rocks

won't be any more penetrating of the hull than what is happening to the ship on its present course.

The rough figures are that we spent \$14 billion a year in premiums and \$7 billion is paid back. Just the economic losses are \$11 billion. That is an unsatisfactory allocation of resources, unresponsive to the needs.

Mr. DAVIDSON. May I respond? I might say that a great many members of the American Bar, Senator, are in complete agreement with your thought that it costs too much to process, if I may use that term, or directs the premium dollar into too many of these small cases. We can't satisfactorily justify by taking up the time of the courts, doctors, witnesses, and lawyers in these small cases. We are spending too much of our energy and brain power on matters of this kind.

I have felt this way for many years. I feel a choice must be made. It is hard for me to justify differentiating the treatment of the so-called small case, but at the same time there are areas where we must yield to the realities of the times.

Senator HART. Most of the dollars, as I understand the DOT study and other testimony, as of now go for persons with the smallest claims where there is overpayment, and for putting back together the automobile.

The human being who is seriously hurt is on the short end of the payment.

If our computations are correct, responding to another point which was made, all but 0.4 percent, or 99.6 percent of the \$11 billion of economic loss would be compensated under the no-fault bill that we have filed, and which we are attempting to improve and get opinions on. If our figures are correct, I think that is an overwhelming argument justifying the taking of a new course and not waiting, even, for the evolution of experience in the States.

As I say, the record of that is unencouraging. The first Federal workmen's compensation law was passed in 1908. It was sort of a no-fault system. The last State in the Union got around to adopting a workmen's compensation law 3 years ago.

Let me repeat the summary positions that we find in the DOT report to Congress, speaking first to the advantages and then to the disadvantages of the system that basically they propose.

It would increase limits, make almost compulsory, or at least require a written declination and these other things. It would be improvement within the existing system, which is basically the American Bar Association's recommendation.

The advantages they recite are these. It would bring reparations to some victims not now compensated, for example, those who are covered by contributory negligence or immunity doctrines.

The second advantage, compulsory universal insurance would prevent uninsured motorists from being able to benefit from the system while not contributing to it.

The third, delay occasioned by court congestion would be mitigated.

As against that, they cite these disadvantages. It retains most of the costs inherent in any adversary system.

It doesn't come to grips with the needs of the guilty victim and his dependents or survivors.

It is more likely to increase costs than to decrease them.

Finally, a more efficient judicial administration may increase the litigation burden rather than decrease it, since more cases can be litigated, albeit faster.

How do you evaluate their evaluation of improvements within the system?

Mr. DEACY. May I speak to that, Senator Hart?

I think we all recognize that it is the small claim which creates most of the problem, the expense problem. We suggest the modification of the existing first-party coverage that will cover most of those small claims, and effectively, without denying anybody their rights under the tort law, but will effectively take them out of the system.

As we say, if the system is modified as we recommend, the only person who will not have recourse to full recovery under tort is the person who is predominantly negligent, predominantly the cause, and the driver in a single car accident. Even those people will be covered under the first-party coverage that is available, and indeed, under the other collateral benefits which the figures show are substantial, so far as the social problem is concerned.

We feel that this is a sound way to proceed and we don't think that you have got to turn the whole system upside down in order to provide special remedies for these two classes of people, and they would be few.

When you take the small claim out of the system, as we think our proposal would, to a large extent, then you are taking away these criticisms that they are overpaid.

When you provide stability, solvency, everyone has adequate uninsured motorists coverage, so those people with remedies don't suffer for failure of solvency to pay them.

Then, I believe, you can clean up the system and still operate it under the present concepts without radical reform. If it doesn't work, then you can do something else.

But once you have adopted the radical plan, there's no turning around and nobody has any idea what it is going to cost.

Senator HART. Not to quarrel with all that you say, I still have concern that the really seriously injured person would still find that that kind of improvement failed to respond to his problems.

Mr. DEACY. I don't think you are going to find any system that is going to compensate everybody under every circumstance. I think it would be prohibitive.

Senator HART. I think we have a system that will restore the economic loss to virtually everybody, and that is the no-fault bill that we are considering.

Mr. DAVIDSON. We are fearful that under the provision as it is now drawn, the seriously injured person may be even more poorly compensated.

I am sure this is the last result in the world that this committee intends to bring about.

Senator HART. Maybe you can help us with the language on that troublesome section to which you addressed yourself.

Mr. DAVIDSON. We have grave misgivings, I might say. I can only speak for myself personally, because the American Bar Association didn't have the privilege of considering your specific bill when they were doing this work.

I was concerned about the \$36,000 that is being permitted, and it may sound as though I am unsympathetic to the position of the claimants, because most of the economic loss, according to the DOT studies that we have seen, usually doesn't exceed the level of \$10,000 up to the time of the settlement.

It is only the future economic loss, that in a few cases runs to \$25,000. This will tend to create a motive, an inducement for people to magnify, run up their losses. It becomes very hard to police a situation like this. It will add enormously to the cost of the system.

It is only one facet of the problem that I have addressed myself to.

Senator HART. I will ask Mr. Sutcliffe to develop any points that he wishes. However, I have one further question on your comments or judgment of the DOT study.

In the testimony from at least two of you, reference has been made to determining the effect that the liability of the tort system has on careless and negligent drivers.

The conclusion of the DOT study—and I omit two sentences, but I think do not distort the position they take—is on pages 53 and 54 of their study.

Unfortunately, the claim of a deterrent effect for the present automobile liability insurance system has so far proven unsusceptible to substantiation by empirical evidence—two investigations continued during the course of the Department's study, however, indicate that most accidents are caused by environmental or personal factors which are external to the individual's conscious control, and that punishment or its threat, therefore, is ineffective as a deterrent to deviant driving behavior.

I had better be careful of the way I phrase this question with all you trial lawyers. Would you agree that that is the general impression that you have of your own driving?

Mr. KUHN. My answer to that, certainly, would be twofold. There is a study that has been made, I believe, by a Miami engineering firm, and I believe the next speakers on the program have access to that study. It shows that fault is a deterrent to careless driving.

Secondly, it may be that a lot of accidents are due to environmental situations, but why eliminate any deterrents? If there are any deterrents in the present system, why not keep them?

I would admit that there are criminal sanctions that will be provided, but if there is any deterrent, I don't think there is any reason for discarding it.

It may be small or insignificant.

Senator HART. What about your own driving experience?

Mr. KUHN. I try to drive carefully, Senator Hart, for a lot of reasons, but not because the insurance man may see you. I don't think I am going to have an accident. I try to watch. But I am conscious that if I do have an accident I have a lot of inconvenience like going to court and being arrested and paying a fine and having my rates raised and all that sort of thing.

Senator HART. Mr. Sutcliffe.

Mr. SUTCLIFFE. Thank you, Senator.

Judge Reardon, I am not puzzled, but I am intrigued by your statement in your testimony where you point to a logical inconsistency in S. 945 where the tort system is preserved for allocation of intangible losses for seriously injured victims, at least certain of the intangible losses.

There certainly is an inconsistency between advocating a no-fault system for certain benefits and a fault system for the coverage of other benefits.

I want to ask if it is possible that that inconsistency arises because for the seriously injured victim we as a society are satisfied that juries who do act, as you point out, as the community conscience, can best judge how much money is appropriate to help assuage the kinds of losses which money really can't cover. If this is so, does this suggest that in the determination of where to draw the line for intangible damages, we might create a mechanism more parallel to an arbitration proceeding, only constituted with a jury of 12 men or nine men from the community to determine, in a particular case, how much intangible loss there was and how much money is appropriate to satisfy that intangible loss?

It seems to me that we are going to the tort system because we recognize the viability, the utility, the justice of paying a man a certain amount because of certain losses that can't really be compensated for by money.

What I am asking you, is there another way that we might be able to go about accomplishing this same thing without the kinds of delays in payment, costs, and so forth, that are inherent within the present type of adversary proceeding?

Is there another kind of adversary proceeding which not only, perhaps, guarantees to the innocent person, but also to the guilty person, a certain level of payment for this intangible loss?

Mr. REARDON. I think two of them have been mentioned here today. One is the reference to the Philadelphia arbitration plan. One, I think I mentioned, and I think the representative of the college mentioned; namely, the increase in medical pay and the provision for loss of income. Wouldn't that do the same thing?

Mr. SUTCLIFFE. We are talking about the intangible loss factor at this point. Are you suggesting—

Mr. REARDON. You are talking about pain and suffering?

Mr. SUTCLIFFE. Yes. We seem to have three labels that we are using: pain and suffering, intangible loss, and general damages. They seem to be the three that we constantly interchange. If we seek to put some kind of limitations for cost reasons, for judgmental reasons, as to where you start the line, your suggestion is that we might submit to arbitration those claims not involving personal injury, for example, but for those claims in the personal injury category, that we cover in S. 945, we might allow for full adversary procedures. Would that be one way to direct the allocation funds for an intangible loss?

Mr. REARDON. I don't understand your suggestion, to be quite frank about it. I am not sure I understand it.

Mr. SUTCLIFFE. What we are trying to do in this legislation, and what other no-fault bills have tried to do, is to draw a line between where you will allow for intangible loss recovery above the first-party coverage. It is very difficult to formulate that line on the basis of medical costs or on the basis of permanent partial disability, because there are so many cases that the community conscience in a particular case would judge meritorious, that those kinds of categories kick out.

What I am looking for is some other mechanism that we could use to allow the community conscience to function in a manner that does not waste valuable resources, that is more efficient.

Mr. REARDON. Is there some compulsion to use another system?

Mr. SUTCLIFFE. Absolutely no compulsion other than the compulsion to try to bring the amount of money taken in and the amount of money paid out up to a level where you are covering losses which occur in the society. It is a compulsion, I guess, toward trying to create an efficient system that does not waste valuable resources of the society.

Mr. DAVIDSON. Mr. Sutcliffe, may I respond to that in part, if I can?

I think I would suggest approaching it from an opposite direction, that by pulling these so-called small cases out of the system and submitting them to compulsory arbitration, where the arbitrators representing the community think it is fair, they will allow damages which might include pain and suffering, but with a ceiling of \$3,000 or \$4,000, whatever it might be; but leaving intact all the other cases that shouldn't be pulled out for arbitration. Then all of these people can be compensated, if there are general damages, without running into the problem you have been confronted with in trying to define what is a serious disability.

If you talk about a 70 percent disability, that might take out virtually all of the cases.

Mr. SUTCLIFFE. This is why I am asking if there is not another level for your approach using arbitration and then a full-blown adversary trial before a court of law. We might be able to satisfy a certain level, mandate a certain level of first-party coverage, and leave open the intangible loss, but have an arbitrator determine that intangible loss.

You see, that particular solution formulated by you a moment ago then, when combined with a first-party floor, has never really been approached or considered. We are looking for answers to some of the problems that we may be confronted with.

Mr. DEACY. You might well say indeed that the adversary system applied to criminal law is very inefficient and costly. On the other hand, nobody is suggesting that we abandon that in favor of arbitrators or some summary system that will handle it probably as effectively, but at a greater saving of cost and efficiency.

I really don't understand the desire to get away from the adversary system in deciding conflicts between people because I think it is the fairest and best system that has ever been devised.

Senator HART. Gentlemen, the committee realizes that in the preparation as well as the time taken on your part you have borne a burden and we are grateful to you for doing so. As a lawyer I am delighted that you have appeared here and that in your several roles you were willing to try to help us. Thank you.

(The statement follows:)

STATEMENT OF EDWARD W. KUHN ON BEHALF OF THE AMERICAN BAR ASSOCIATION

Mr. Chairman and Members of the Subcommittee, my name is Edward W. Kuhn, Chairman of the Section of Insurance, Negligence, and Compensation Law's Special Committee to Achieve Justice Through the Adversary System of the American Bar Association, I appear here as a representative of the American Bar Association by designation of the President of said Association.

The American Bar Association is the largest legal organization in the world with a membership of 150,000 lawyers, judges, professors and scholars. Its House of Delegates is composed of 291 members and represents not only the American Bar Association, but because it contains representatives of all the state bars, the large local bars and approximately 20 affiliated legal organizations, it represents

the legal profession in the United States. It is the national spokesman for the legal profession.

The Association has a vital interest in S. 945 and in "no-fault" legislation pending in the Congress. It has given the subject much attention and at its August, 1969 annual convention in Dallas, Texas, approved Report No. 18, the so-called Powers Report. A copy of said report is attached hereto, and we ask that it be made part of the record. It is a comprehensive treatment of the subject matter from practically every angle. It was compiled after thirty-eight meetings of two-day duration by a committee of lawyers and judges ably assisted by a commission composed of representatives from government, the industry, law schools and consumers.

The fundamental principle adopted by the House of Representatives is as follows:

"The present system for providing reparations for those injured in automobile accidents, based upon the concept that if there is no fault there is no liability and relying upon an adversary method of trial before a court or jury as the means of determining liability and the amount of damages, be retained as the basic legal structure for dealing with such cases but that the following proposals for further study, changes in, additions to and modifications of such system should be further considered . . ."

The House of Delegates adopted approximately sixty committee recommendations for improving the present tort system classified as follows:

- A. Recommendations regarding delay in the courts, twenty-four in number;
- B. Recommendations as to substantive law, seven in number;
- C. Recommendations as to the law of damages in automobile accident cases, four in number;
- D. Recommendations as to certain categories of persons who are injured in automobile accidents, three in number;
- E. Recommendations as to costs being eight in number;
- F. Recommendations as to automobile insurance, four in number;
- G. Recommendations as to the use of the tort law to deter dangerous driving, one in number;
- H. Recommendations as to the Cotter Plan, eight in number;
- I. Recommendations as to highway safety, one in number.

A condensed copy of the recommendations as taken from the report is attached hereto and made a part of the record.

Also attached is copy of an article written by Franklin J. Marryott, retired general counsel of Liberty Mutual Fire Insurance Company, and the reporter for the Powers Committee, which sets forth the position of the American Bar Association and made a part of the record.

It is not my purpose to go into each of the many recommendations contained in the report, which is known as the lawyer's plan. Neither is it my intention to cover the approximately one hundred plans in existence on "no-fault" insurance. The published line-by-line commentary of conflicts, unresolved problems, inequitable treatment and fallacious reasoning is copious and easily obtainable.

My general objection to all "no-fault" legislation is that there is no great demand by the general public for a change. The surveys conducted by the Pennsylvania Chamber of Commerce, Market Facts, Inc., the State Farm Mutual Insurance Company, Insurance Agents, Drake University, the University of Michigan, the Minneapolis Tribune and even the Department of Transportation indicate that the majority of the public are satisfied with the present system. These surveys are the answer to those who claim that the legal profession is opposed to "no-fault" plans because of the alleged adverse effect on the lawyers' pocketbooks.

My specific objection to these "no-fault" plans is that they are asking the injured person to give up his claim for pain and suffering, loss of life's pleasures, inconvenience, future impairment of earning capacity, disfigurement, loss of limbs, sight, hearing, consortium, prenatal injuries, impotency, right to catastrophic losses and many other losses in return for a certainty of payment of his medical and hospital bills and some loss of earnings. They discriminate against housewife, the minor, the elderly, the disabled, the unemployed, the married man with a large family and many other segments of our population.

I am opposed to depriving the union men and the laborers and to those who have provided their own health and accident protection of their collateral benefits because many of these plans would limit recovery by the amount of available collateral benefits.

I am opposed to forcing people to purchase two types of policies—"no-fault" and present policies.

There is no proven certainty that costs to the premium paying public will be lowered. There are many claims but the actuaries are in fundamental disagreement. Many eminent statisticians contend that costs will increase under a "no-fault" plan. And if we go to a "no-fault" plan it is going to be extremely difficult to return to the present system.

A "no-fault" plan will have a great impact upon the industry itself. Under some of these plans the highly competitive and efficient small and medium-sized auto insurance writers will be doomed to extinction because only the giants are equipped to withstand the rating uncertainties, administrative costs and retraining of personnel.

The adoption of these plans will ultimately lead to Federal takeover of the automobile insurance industry. They will injure the deterrence factor and increase careless driving. They do violence to our traditional and moral belief that the negligent party should compensate the innocent victim of an accident. They should not be treated as equals.

We do not accept the contention that automobile cases are clogging the courts. Other types of cases are the main culprits. We do not believe that because auto cases require 11.4 percent of the judge's time in the federal courts and 17 percent in the state courts the present system should be amputated. We do not believe that the juries are unable to determine fault.

The American Bar Association takes no position with reference to the three other insurance bills pending, viz; the group merchandising, the tax reductions and the automobile safety bill.

It would be difficult for any lawyer to leave this subject without some comment that goes beyond the economic realities involved. The law and all those involved in it can view with reasonable pride the advances in individual rights which have been made in the last 20 years. That a correlative growth in individual responsibility is often lacking seems all too obvious. A large part of the American population has abandoned the belief that one is responsible in the next world for what he does here. We are now busy considering plans which will tell the same people that they aren't even responsible in this world for their acts. All the present "no-fault" programs contemplate one further abandonment of individual responsibility. No one can with any degree of certainty calculate the effect of this upon the level of death and injury on the highway. I think it can be said with reasonable certainty, however, that a system which boldly proposes to reduce benefits to the innocent in order to compensate the person at fault is not likely to contribute to added safety on the highway. And quite apart from its immediate effects on life and limb, it strikes at every core of the proposition that freedom is based upon individual responsibility.

When all is considered, the benefits to be received from any "no-fault" plan are wholly illusory. And the losses such a plan would bring are too high a price to pay for an experiment the public doesn't want anyway.

Senator HART. We welcome the president of the Defense Research Institute, Inc., Mr. Willis Smith of Raleigh, N.C.

I think it would be well, because I understand one of the witnesses who is scheduled, was not able to come. If you, Mr. Smith, would introduce, for the record, those who have come here.

**STATEMENT OF WILLIS SMITH, JR., OF RALEIGH, N.C., PRESIDENT, THE DEFENSE RESEARCH INSTITUTE, INC.; ACCOMPANIED BY REID A. CURTIS, PAST PRESIDENT, ASSOCIATION OF INSURANCE ATTORNEYS, MERRICK, N.Y.; WILLIAM E. HEROD, PRESIDENT, FEDERATION OF INSURANCE COUNSEL, NASHVILLE, TENN.; EDWARD J. KELLY, PRESIDENT-ELECT OF THE INTERNATIONAL ASSOCIATION OF INSURANCE COUNSEL, DES MOINES, IOWA; JAMES D. GHIARDI, RESEARCH DIRECTOR, DEFENSE RESEARCH INSTITUTE; AND JOHN J. KIRCHER, ASSOCIATE RESEARCH DIRECTOR, DEFENSE RESEARCH INSTITUTE**

Mr. SMITH. I wish to express our thanks to you for the privilege of being here.

I have on my right, Mr. William E. Herod of Nashville, Tenn., the president of the Federation of Insurance Counsel. On my immediate left is Mr. Reid A. Curtis of Merrick, N.Y., who is the immediate past president of the Association of Insurance Attorneys and a director of the Defense Research Institute.

Mr. Herod is also a director.

On my far left is Mr. Edward J. Kelly of Des Moines, Iowa, who is the president-elect of the International Association of Insurance Counsel, a director and a member of the executive committee of the Defense Research Institute.

We also have with us Prof. James D. Ghiardi of Milwaukee, Wis., a distinguished professor of law at Marquette University, the research director of our institute, and the current president of the State Bar of Wisconsin.

With him is Mr. John J. Kircher, the associate research director of our institute.

Senator HART. Mr. Smith, if you would like to have the professor and Mr. Kircher join you, they might very well have some suggestions.

Mr. SMITH. Senator, the Defense Research Institute was organized in 1960 by members of the International Association of Insurance Counsel as a research institution devoted to improving the administration of justice and also to increasing the skill and knowledge of defense lawyers.

We have approximately 6,000 lawyer members.

Senator HART. Talk about a slow audience, you had one on me. Until you just explained, I had been sitting here wondering how an institute involved with the military security of the country happened to be in here. I didn't get the defense point at all.

I thank you for explaining it.

Mr. SMITH. We think we help the defense lawyers with their efforts. This is one of our aims.

Senator HART. I am sure of it.

Mr. SMITH. We have 6,000 lawyer members, Senator, and all of the members of the International Association of Insurance Counsel, all of the members of the federation, all of the members of the Association of Insurance Attorneys, are members of DRI.

In addition, we have other lawyer members who are not members of those associations. We have insurance claimsmen who are members and we also have corporate members. All told the 6,000 lawyers are from law firms which aggregate probably 20,000 lawyers.

In Milwaukee we maintain a staff of four lawyers, research assistants, an information director, and a library. We issue a number of publications each year. We are primarily engaged in research and do not lobby. This will possibly be our only appearance in this respect.

We wish to offer you and your staff the facilities of our institute and give you the benefit of our ideas.

I must say, sir, that we do wish to oppose the present proposal.

Since we have a prepared statement, I would like to submit it for the record with the exhibits. We have a number of exhibits attached and I would like for each one of those to be made a part of the record, with your permission.

Senator HART. I noticed that you did have a statement and apparently were summarizing.

Yes, let us order the statement printed in full as though given in full and the several exhibits <sup>1</sup> will be made a part of the record.

Mr. SMITH. Thank you. You have been very patient today and the time is late.

I will very briefly, if I may, mention the points that we are concerned with in the bill.

We think, first, there is no public understanding of this matter of "no-fault." We think, also, there is no public demand for drastic change of the present system. These views are supported, we believe, in our statement.

We think that the term "no-fault" is imprecise. In our statement we have attempted to define three different types of plans. The complete self-insurance proposals almost completely abolish individual responsibility. Examples are your bill, and the Rockefeller plan.

Then there are limited self-insurance proposals. These give some protection on a first-party basis but they also allow the injured party to follow a legal remedy.

The third type of proposals are the various reform recommendations. I would like to discuss our reform proposals briefly in just a few minutes.

At the beginning we have objections to the Hart bill in that its benefits, we think, are limited.

The first witness this morning was the very distinguished gentleman from Wayne County, Mich., and he endorsed the plan. I couldn't help but think of an 8-year-old girl walking home from school one day in Wayne County, Mich. If she was struck by a drunken driver running up on the sidewalk and the accident injured her so badly that she lost her leg, she would have no economic loss in the sense of a wage loss. She would only have her hospitalization. Then she would go through life with the limited recovery of a few artificial limbs as she grows.

I believe I understand that the committee is concerned about this problem, but we do wish to state very strongly that this is not a proper way to approach it. I hope I am correct that the committee is considering this.

Senator HART. Yes; you are. We are concerned about it.

Mr. SMITH. We think, sir, it is perhaps inequitable between the victim and the person who causes the accident. I will be very brief on this, just as an illustration.

If two young men are involved in an accident and one of them has gone through a red light and both are 22 years old and one is a student and one is an entertainer and they lie in a semiprivate room side by side for 6 months while their legs heal, the student receives no money other than the hospitalization and the entertainer receives \$6,000 even if he is the man at fault. This doesn't strike me as reasonable.

We object to the compulsory feature of the no-fault system.

We object to the attempt to reduce costs by reducing benefits. This again goes back to matter of the pain and suffering.

Let me say this, Senator. I am sure it was not your intention, but it seems to me that you are perhaps putting economic loss ahead of human loss in this bill. From what I know, I doubt if that was your intention but I believe that is the result. We think that a person who

110 DECEMBER 1964

<sup>1</sup> See p. 750.

is injured through the fault of another should have a legal right to proceed against that other person.

This plan would remove the fault system. We think that fault does act as a deterrent. A study filed as exhibit E with our statement supports this position. Another study has been prepared and reaches the same conclusion. We will submit that to the committee when it is published.

Senator HART. We would welcome that.

Mr. SMITH. One more point and I will move on to our proposals that we advocate.

A question was raised this morning by Senator Cook, I believe, about which courts would interpret the act proposed by your bill. This being a Federal act, I would assume that the Federal courts would have to interpret it. I think we might get into some real congestion in the Federal courts as a result.

In 1969 we prepared and published back a document entitled "Responsible Reform." This is exhibit H of our exhibits. So far as I know, this is the first of the reform proposals.

I believe that a great many of the proposals advocated by the American College of Trial Lawyers, the American Bar Association, and the American Trial Lawyers—are modeled after our proposals.

We urge your committee to consider our proposals. We know they will receive your attention.

One of the first things we cover is highway safety. We believe there should be strict sanctions for persons who are habitual violators of motor vehicle laws or who drive under the influence of drugs or intoxicants. There are more people killed on highways each year than in Vietnam and we think strict enforcement of the laws could cut the cost of insurance as well as saving lives.

We advocate a system of optional first-party coverage. The difference between our proposal and those of other plans is that their coverages are mandatory or compulsory and ours is optional. We believe that the economic loss can be covered through an optional first-party proposal.

We have a proposal on court congestion.

We have a proposal for the contingent fee regulation. We believe that the percentages charged by plaintiffs' lawyers should be regulated by State bars or by court rule. This would perhaps result in more money going to the victim.

We have considered the question of comparative negligence. We have discussed the question of advance payments by insurance companies. We think these should be given consideration.

Mr. Curtis is chairman of our committee for the continuing study and undating of Responsible Reform. I would like to ask Mr. Curtis to discuss the activities of his committee and anything else you may wish to bring to his attention.

Mr. CURTIS. If you please, Senator Hart, we have had, as Mr. Smith has advised you, these proposals for quite some time. We appreciate that times change and quite rapidly and in accordance therewith we now have a special committee, of which I am honored to be the chairman, to study and update Responsible Reform.

One thing I would like to point out about our proposals is that No. 1 on the list in order of importance is highway safety, as Mr. Smith

referred to. We still feel that we are lagging far behind the rest of the world on highway safety and yet we do nothing about it. It is a costly process but it is one that we have to do. If we eliminate the accident at its causation point, we eliminate the costs of insurance for it because insurance costs vary with the accident rate.

We are also studying very carefully at this time our second proposal, which is for first-party coverage. It provides a first party economic loss reimbursement for the injured party, and of course it would be regardless of fault. At the time Responsible Reform was published we felt that there was no way to truly measure pain and suffering on a formula basis. We still feel pretty much that way. We are now coming to the conclusion, although we haven't reached any finality in a report as yet, that something must be done with first-party coverage, perhaps on a compulsory basis. We originally proposed it for the States to act upon dependent upon the situation in the individual State.

We are now coming to a conclusion, although we haven't really finally reached it, that we must do something about the pain and suffering situation in small cases which has been the complicating factor that I believe has increased the cost of insurance far beyond what it should be, as you pointed out earlier today.

We have studied very carefully the plans that have been proposed by the National Association of Independent Insurers, by the American Mutual Insurance Alliance, both of which are not no-fault plans but both of which refer to the small case and they fix \$500 as special damage in those cases as the breakpoint between the small and the large case. Below that amount they fix a formula of 50 cents on the dollar of special damage for pain and suffering.

A similar plan has been proposed in the State of New York by Senator Gordon, chairman of the Senate Insurance Committee, called the Gordon bill. That proposes that \$400 be the breakpoint on these small cases and that pain and suffering or general damages be paid on a dollar-for-dollar basis up to \$400. Over that, the case goes into the adversary system.

When you go into formulas for general changes you have to hurt somebody. You have brought up here the figures of cost of insurance. You have said that there was \$14 billion in premium payments, that there were \$11 billion of economic loss and only \$7 billion of payout from that premium dollar. Of course those statistics standing alone show a bad situation. But I believe that a remedy in the way that I have talked about, our first-party coverage and a formula for pain and suffering in the smaller case, will bring about a tremendous improvement in the payout compared with the premium dollar. This is because it costs as much for the insurance company to handle these small cases as it does the large one. They are flooded with them. They are frequently brought, as one of the speakers mentioned this morning, as a coverup for property damage recoveries.

I don't know about Massachusetts where it was said there were seven times as many claims as the national average and it was because they didn't have compulsory property damage coverage, but I do know that in New York small claims of this kind are frequently presented in order to collect fully for property damage. This is because the lawyer tells the client when he comes in, I can do you no

good. If you have \$250 damage to your car and I get you \$250, which means a lot of work, by the time I charge my fee you have lost money. So how is your neck feeling? And of course he has a bad neck for a little while and recovers.

So those little cases are eating up that money.

There is one other factor that you must look into carefully before you accept that \$11 billion figure. The figure was \$11 billion for economic loss and I presume those figures are taken probably from insurance company statistics as to the claims made. I don't know, Senator, whether you ever had any active practice in the field of negligence as an attorney. I have been in this business a long time as a defense lawyer. I can tell you that the collection of bills and particulars, which in New York is the specification of damage furnished by the plaintiff, is the greatest exercise in fiction that you have ever seen. The economic damage, if you take it from those figures, the amount of claimed loss earnings and the amount of claimed medical damages, upon inspection and investigation and trial sometimes is cut down to one-tenth of that amount and frequently to half.

So the \$11 billion of economic loss is undoubtedly based on those claims.

If you divide that by half you come closer to the actual fact.

Now, your bill has as its intention to compensate, as you point out, 99.6 percent of those who have that economic loss. But you are only going to compensate them for net economic loss. If we took net economic loss, deducting collateral benefits on those bills of particulars, you would find that instead of being \$11 billion it would be about \$1 or \$2 billion of uncompensated net economic loss. On that basis, by adopting a collateral source rule, the present system could handle this as well, could still provide for pain and suffering compensation to the injured party, and could reduce the premium costs.

So actually you have a false statistic, I respectfully state, in that \$11 billion. When you are talking about \$11 billion, that is not net economic loss. It is economic loss as claimed by plaintiffs.

There is one other factor there. I know in the DOT study much of what they went into was future economic loss when the person was interviewed. I don't know whether this \$11 billion is based on claims of a plaintiff of having \$500 loss now but continuing in the future, because if so, again it is highly suspect as to its probity in many cases.

Senator HART. It is my understanding that those figures do come from the DOT. Mr. Sutcliffe may clarify the source, or at least identify the source.

Mr. SUTCLIFFE. I would like, for the record, to include from the Department of Transportation an exact explanation of the way they arrived at the figures. It is my understanding that they were aware of the possible bias of basing the figures on the basis of amount of claims submitted to insurance companies. The statistical basis for the net economic loss that they felt was compensable was on the basis of information taken from outside claimant files, and primarily through personal interviews they conducted specifically for the study. They were not biased to the extent that a person was trying to make a claim in order to recover a certain percentage of the claims for the insurance study, but for the record I will provide a precise explana-

tion from the Department of Transportation as to how they arrived at that particular figure.

Senator HART. Let it be included in the record at this point.

(The information follows:)

OFFICE OF THE SECRETARY OF TRANSPORTATION,  
Washington, D.C. June 7, 1971.

MR. S. L. SUTCLIFFE,  
Counsel, Senate Commerce Committee,  
Washington, D.C.

DEAR LYNN: AS you know, the calculation of accident loss data is fraught with conceptual, definitional, semantic and informational difficulties. With that verity in mind, let me review just a few of these difficulties and then describe the methodology employed in the "compensable economic loss figure" in the Final Report.

First, in many cases the existence of a "loss" is established only when a "cost" is actually incurred and, in turn, the incurring of the cost takes place frequently only when there is assurance of reimbursement from a compensation source. Thus, if a victim has access to a comprehensive insurance policy, his therapeutic regime will be similarly comprehensive, including all kinds of purposely redundant test procedures, X-rays, special care, etc. Because these expenses are cost-free to the victim and accident related, they would constitute compensable losses in the context of our calculus. In contrast, "needed" medical care that is not compensable by some benefit source, can't be paid for directly by the victim and is, therefore, not received and never appears in our crude calculations of a "loss." The relative degree of over- and understatement of losses that occurs from this anomaly is simply not quantifiable—although, on balance, it would seem almost certain to lead to an understatement of losses.

Another major conceptual difficulty is found in the estimation of the value of "lost future wages" and their translation into present values. The methodology employed in the "Serious Injury Study" and the basis of the estimates used in the Final Report is described in detail in the study, "Economic Consequences of Automobile Accident Injuries." Suffice to say that the admittedly arbitrary assumptions used in this methodology were purposely made very conservative, and, therefore, the resultant estimates are almost certainly on the low side.

The calculation of "compensable" economic loss is briefly described in the Final Report pp. 4ff and the applicable footnotes. Medical expenses and wage losses were extrapolated from the results of surveys, one of fatally and seriously injured victims and the other of paid personal injury tort claimants. The methodologies and survey procedures for both of these studies is fully documented in the reports, "Economic Consequences of Automobile Accident Injuries" and "Automobile Personal Injury Claims." In both cases, survey data were based on economic losses reported by the claimant or victim. For serious injury victims, loss data was collected in much detail and in many cases independently verified with doctors, hospitals, etc. In the case of paid tort claimants, the economic loss data was checked by the insurance company adjuster who presumably had access to receipted bills, etc. Thus the loss data used were not the losses "claimed" by victims but rather insofar as they could be reasonably policed were the economic losses actually incurred to date of interview or settlement. While there is always the possibility of conscious misrepresentation or unintentional mistakes, or failures of memory by victims, considerable precaution was taken to avoid distortion of the data by these phenomena. Most definitely, simple *assertions* or *claims* of losses by victims were not used in these estimates. Finally, to the degree that one can make a judgment about these compensable economic loss estimates, they seem much more likely to have been understated than exaggerated.

As you know, totally excluded from these loss estimates were any claims for intangible losses, i.e., pain and suffering, inconvenience, etc.

One final point, the witness was correct in saying that the compensable economic loss estimates were not "net," rather they are "total" compensable economic loss estimates free of any excludable duplication or exaggeration and purposely hedged to be on the conservative side.

If you have any further questions in this regard, we will be happy to help you.

Sincerely,

RICHARD F. WALSH,  
Deputy Director of Policy and Plans Development.

Mr. CURTIS. I speak, as I say, from the standpoint of a practical, practicing trial lawyer. I suspect statistics based on claims made and sometimes on personal interview. However, that is one of the things that we feel is somewhat unfair in the statistics presented against our position under responsible reform. We have many other fields that we have recommended and are continuing to study. Court congestion is one. That is covered by having enough judges based on a population basis. This morning someone mentioned Dade County, Fla. Dade County was 6 years behind until Florida adopted its constitutional provision giving them one circuit court judge for each 50,000 population. I understand now they are about 35 or 40 days behind if they really want a trial that quickly. It can be covered easily that way.

We also have the field of comparative negligence, and as a defense lawyer in New York I have recommended to the New York Legislature that they adopt the Wisconsin plan of comparative negligence which permits a plaintiff to recover, providing he or she is less negligent than the defendant. In other words, the 51-49 plan. We do not at the present time have—and I think it is unfair—the Mississippi plan which allows complete payment. Even if you are 99 percent negligent you still get 1 percent of your damages.

We also, of course, have urged the elimination of the ad damnum which is used by plaintiff's counsel to kite verdicts and particularly the publicity in the papers. We feel that the responsible reform recommendations in our exhibit H, if they were adopted, would solve much of this problem and with the updating which we expect to have probably by around the first of July. We feel that a plan which adopted our proposals would solve practically all of these problems and should therefore be given a fair trial before, as one of the other people speaking here said, we have an irreversible system that could do radical harm if it doesn't work out as it was thought.

Just one last comment. People were talking this morning about Great Britain, West Germany, and somewhere else in Europe as having these health plans that pay everybody. Their insurance works out fine. The only trouble with it is that the statistics that I saw here, which are supposed to be from the Metropolitan Life Insurance Co. and came out of Best's Insurance News, showed of 13 countries, the United States had the best safety record in relation to mileage driven during 1967-68 and the countries with bad records were Australia, Canada, Denmark, Finland, Great Britain, Japan, Netherlands, New Zealand, Norway, and West Germany.

We have a fault system. They have in part, no-fault system in many of those places and our statistical record is much better than their's. I think somebody ought to look into that before we adopt plans and say these other countries are getting along fine. They are, but they are killing more people.

Senator HART. Coming from where I do I will have to insist that this reflects the motor vehicle safety consciousness of the American manufacturers and roadbuilders.

Mr. CURTIS. I think it does. I know a little bit about automobiles and foreign automobiles, and many of them are very unsafe vehicles also.

Senator HART. Thank you.

Mr. CURTIS. I would even agree with Mr. Nader, "unsafe at any speed."

Mr. SMITH. Mr. Kelly will say a few words.

Mr. KELLY. Senator, first of all on behalf of the International Association of Insurance Counsel with our 2,400 members, let me express our appreciation for the opportunity to appear here. You have had responsible reform presented to you. There doesn't seem to be any demand for a complete reversal of the traditional tort system. It is our responsibility to present responsible reform to you and to the public.

How do we responsibly bring our current systems up to date to meet current needs? I believe that has been the proposal. I want to touch on two things that I think are very important, some of which will be touched on by other speakers.

First of all, I mentioned that there doesn't seem to be any demand for a change. The other thing, and it was mentioned by Senator Cook this morning, is the more efficient use of the legal effort. We have judges appointed now on the basis of whether we ought to have some more or not. This is not an efficient use of the legal effort. We need them where judges are most needed and they must be moved around and used where they can be used most efficiently to handle the volume of business before them.

You also notice in this, sir, when you read it, the matter of the abuse of the contingency fee. That hasn't been discussed here by Mr. Kuhn or the other speakers, but it is pointed out that contingent fees must be regulated, and perhaps in that manner a greater amount of the dollar paid by the insurance carrier will be received by those who are injured.

Our facilities in the Defense Research Institute are available to you and to your committee. I appreciate the opportunity to appear here.

Thank you.

Senator HART. Thank you.

Mr. SMITH. One last thing, Senator, if I may, and we will conclude.

The question of State action has come up and the proposal of the Department of Transportation calling for State action. I would like to call your attention to exhibit F in our statement which shows that at the time this was prepared, bills had been introduced in 33 different States containing some form of no-fault or modified no-fault proposal. I believe there have been two bills introduced in Michigan, one on the Cotter-type plan and one on another plan.

I think it is possible there may be action in the States.

Senator HART. Given the general reservations you have about no-fault, it is hardly fair to ask you this question, but with an apology, let me put it to you.

Assume that we use the words "foreseeable future," that we can't really guess what we are talking about, but in the next few years we will have half of the States with no-fault if a Federal no-fault bill does not emerge. That would be 25 varieties one could anticipate of no-fault.

From a defense counsel's standpoint is that 25 varieties preferable to a uniform national variety?

Mr. SMITH. You mean if we have to have something would we rather have a uniform law?

Senator HART. Accepting the assumption, although not necessarily agreeing with it.

Mr. SMITH. Senator, I had not thought about that. We would like to give that some consideration and we will not evade your question but we will write you an answer. Maybe the others could answer it now but I would prefer to consider it.

Mr. CURTIS. Speaking for myself, Senator, I would agree with you that if we were going to have a no fault-plan, then perhaps a Federal one would be more all-inclusive. Although it has the Federal Constitution and 50 State constitutions to overcome. However, I thought I spoke against no-fault. Limitation of liability bills are I think coming. But I think one last statement is this, and perhaps it answers it.

I have found that as a practicing lawyer, in most cases the people were not so much concerned about economic loss. In New York 83 percent of the people have collateral benefits anyway. They throw as much money on the horses over at Roosevelt Raceway or on a Saturday night out as they lose in their economic loss in the case. What they were complaining about was the pain in the back that didn't go away, the possibility of a future operation, the twisted arm, the inability to use their normal functional operations. That was much more important to them than economic loss.

The bill which you proposed in all good faith wipes out the thing they are really worried about and gives them a net economic loss. I don't know where the information comes from otherwise, but frankly from a practical standpoint with some people there are some very bad cases with high economic loss and of course it is terrible, but in the average case even up to \$1,000 of net economic loss the person isn't worried about that. He is going to worry about whether he will get better or whether his neck will hurt him all the rest of his life.

That is why I don't think a Federal no-fault bill should be passed. Senator HART. I have your basic position clear.

Mr. Smith, did Mr. Herod intend to make some comment?

Mr. HEROD. Thank you a lot, Senator.

At this late stage I am afraid that anything that I might say would be merely repetitious. I agree fully on behalf of the Federation of Insurance Counsel with the statements and proposals that are submitted through Mr. Smith and the others.

Thank you, sir.

Senator HART. Professor, maybe you would like to speak.

Mr. GHIARDI. I would like to respond to your question about 25 State plans. Our statements points out that there is no virtue in uniformity. I would fear a Federal tort law system or automobile insurance system that equates the citizens of Wisconsin with the citizens of the other States where we have some different needs, where we have some different cost factors. We have different figures. I think we can accommodate varying plans. I don't anticipate that if we put in State plans that they will vary that much.

There is considerable uniformity among tort law today. We can get down to a few areas where there isn't uniformity. One is comparative negligence. Wisconsin is a pioneer in that. We suddenly find now, after 35 years, that we have been rather far thinking and liberal in our Midwestern State that borders Michigan.

Now the other States, the effete States of the East, have suddenly looked at these plans and think they are pretty good. We think much can come out of these State plans. We don't think that necessarily it has to come out of Washington.

As a teacher of insurance for 25 years, as a teacher of torts for 25 years, I have not been convinced that one jurisdiction, or the Federal Government, will necessarily evolve the plan that ought to be the plan in this country. I would fear that and I would like to answer the question that you posed directly, because as somebody said in DOT, they would like to see every automobile that drove around the Washington Monument covered with the same amount of insurance, applicable to the same thing, even though they come from 50 different States.

That may be all right when they are here driving around the Washington Monument, but when they are back home we would like to have them have a little closer touch to our courts, to our legislators and to the insurance problems that we face in each jurisdiction.

Senator HART. Mr. Sutcliffe?

Mr. SUTCLIFFE. In your proposed statement, Mr. Smith, you suggest that no-fault plans will compel motorists to insure themselves against the carelessness and recklessness of the other highway users. What does the present uninsured motorist coverage purport to do if it doesn't purport to have a motorist insure himself against the carelessness and recklessness of another driver who is uninsured?

Mr. SMITH. The present uninsured motorists' provisions?

Mr. SUTCLIFFE. Yes. You are arguing that a no-fault plan will require you to insure yourself against the carelessness of the other drivers on the highway. At the present time does the uninsured motorists' coverage also compel you to insure yourself against the carelessness of the other drivers on the road?

Mr. SMITH. This is not compulsory in many places, so far as I know. North Carolina is a compulsory State and there are minimum limits for uninsured motorists coverage, but it does not compel anything beyond the minimum limits.

Mr. SUTCLIFFE. Does a prudent man take out such a coverage anyway?

Mr. CURTIS. If you are gaging it by prudent men, I would say yes.

Mr. SMITH. We are considering not only the question of uninsured motorists but underinsured motorists. Mr. Curtis will report on that.

Mr. GHIARDI. Our reform proposals include the mandatory offer of uninsured motorist insurance. We find that where it is offered and particularly where there has to be an express rejection, that most people will take uninsured motorists because its cost is low. It protects them against the event that there is someone that is not economically able to respond to damages. As Mr. Smith points out, we also think that there is a development by some companies to provide for the so-called underinsured motorists; that is, uninsured motorists, usually based upon the minimum limits in the State, in our jurisdiction \$15,000 and \$30,000.

Mr. SUTCLIFFE. That is high, isn't it?

Mr. GHIARDI. Yes. In other States it's \$5,000 and \$10,000. One of the proposals being considered is the fact that it is inadequate because there can be serious loss. If I carry liability insurance for \$100,000 to \$300,000, why shouldn't I be protected to that same extent if somebody else strikes me and he only carries the minimum limits of 10-20 or 15-30? So there are ways in which you can have feasible protection for yourself.

The answer is yes, a prudent man would do that providing we keep the rates low enough that he can purchase it.

Mr. CURTIS. And one other thing. Uninsured motorists' coverage covers pain and suffering, general damages. It doesn't cover just for net economic loss.

Mr. SUTCLIFFE. It is one of the few coverages, then, that prefers the person to the car. As I understand in most coverages it does not cover the property damage loss.

Mr. GHIARDI. Uninsured motorists' coverage does not cover property damage loss.

Mr. SUTCLIFFE. Doesn't only one State allow for property damage coverage?

Mr. GHIARDI. I think you are correct. An endorsement is allowed in some jurisdictions.

Mr. SMITH. One of our points is that you are forced to purchase the insurance mandated by S. 945 but you don't get the benefits if you have other collateral benefits.

Mr. SUTCLIFFE. Perhaps there has been a misunderstanding as to what the bill would mandate. We had an interesting exchange on Monday with Mr. Klein of Consumers Union to discuss the way in which you would rate a particular policy on the basis of the collateral benefits available to the purchaser of that policy so that you would not be paying, as someone suggested here, twice and receiving only one recovery. There would have to be built into the rating system a procedure whereby the collateral sources of the individual being insured on a first-party basis would serve as a setoff to any premium charge on the mandatory first-party coverage.

We raised the point with Mr. Klein because he was advocating this on the basis that first-party coverage outside the automobile insurance system seemed to have greater cost savings to consumers. We raised it with him, as I began to say, to ascertain from a practical standpoint how you would create these classifications and fit the different rating systems together so that you would avoid the kind of criticism that we have had of double payment and single recovery, rather than the other way around now of double payment and double recovery and no coordination of benefits.

Mr. SMITH. That strikes me as being difficult to do. Of course I anticipate that the insurance company would provide in its policy that it was secondary to the automobile policy.

Mr. SUTCLIFFE. The interesting thing, on the basis of the House hearings, is that the Blue Cross and Blue Shield has communicated to Congressman Moss that they are going to begin treating automobile accidents as primary rather than secondary. Rather than trying to get rid of the automobile accident claimant their emphasis is exactly the opposite of what was anticipated by some of their critics.

Mr. CURTIS. I think the reason they do that, they have a fear of losing premium volume. They were afraid that if they were going to be secondary to automobiles, a lot of people might drop them completely to save money. They would be mandatorily forced to buy automobile insurance. I had heard that and that seems to me a pretty well-founded rumor, that they say, "We'll be primary on automobile accidents," because they want to keep that premium dollar.

Mr. SUTCLIFFE. The auto insurance industry, as you realize, is very anxious to be able to keep that premium dollar and remain primary in the system.

Mr. CURTIS. I don't know what Mr. Klein said, but when the man comes in to buy a policy, you are going to have to get a statement from him as to all of these collateral sources. He may not even know of them. In some instances you will have to probe. But there is no guarantee the collateral sources will continue for another day.

He is working for a corporation and they provide all of these benefits. Three days after he takes an auto policy he gets another job where they don't have the benefits. I don't know what your experience has been, but in New York where we have compulsory insurance on automobiles now, fraud in the inducement is no longer a defense on the policy. We still have to pay.

We can cancel the policy if we find out about fraud. But the cancellation isn't effective for 20 days after notice. We are still liable on that policy until that time. Now what are you going to do about a fellow who lies about his collateral sources? How are you going to remedy that?

You are going to have all kinds of chicancery going on and you are going to have to investigate this man to find out if he is insurable or not.

Mr. SUTCLIFFE. I think a number of different provisions you have pointed out will have to be closely examined. This is another example of that kind of problem.

Mr. CURTIS. When you have a compulsory plan, you can't really allow anything to interfere with the policy except conditions subsequent to purchase. You can't let a condition precedent interfere because otherwise you would not know whether the people were insured or not.

Mr. SUTCLIFFE. In your statement and in your oral presentation, you discussed the importance of cost savings from the accident environment as well as from within the benefit delivery system. Do I gather by those comments related to safer highways, better construction of vehicles, that you would support efforts for property loss reduction standards such as bumper standards for automobiles as a way of controlling costs?

Mr. CURTIS. Speaking for myself, very definitely so.

Mr. SUTCLIFFE. So you would support S. 976 before this committee?

Mr. CURTIS. That is the so-called bumper bill? Definitely.

Mr. SMITH. I cannot take a position on that question since I am not prepared on that point.

Mr. GHIARDI. However, Responsible Reform does spell out numerous highway safety bills in legislative form. The questions of seat belts and all of the other aspects are covered. It also indicates that we would support other types of highway safety reforms. Clearly, collision loss and property damage is the big item. Collision loss and property damage, in the insurance package today, accounts for up to, in some instances, two-thirds, if not more, of the premium. Efforts to reduce that, of course, are within the scope of our Responsible Reform.

We have not taken an official position on the bill but our statement does allude to the bumper bill as a step in the right direction.

NEW YORK PUBLIC LIBRARY

Mr. SUTCLIFFE. As long as you have mentioned the need for highway safety programs and the failures to date in many of the highway safety programs, how do you rationalize the present failure of the State jurisdictions under the Highway Safety Act to meet the 16 highway safety standards on an individual jurisdictional basis, with your statement about the need for each individual jurisdiction to look out after the citizens within the jurisdiction?

In other words, we have one area where we have left it to the States; there has been notable inaction. We are certainly going to examine that undertaking in considering what approach to take on any efforts toward automobile insurance reform that might be advocated by members of this committee.

Mr. GHIARDI. I think, Mr. Sutcliffe, if I can respond to that, when you get into highway safety, the qualifications of the driver, the implied consent law and things of this sort, you hit every person individually. You hit legislators very hard. The politics in safety programs is much higher.

Mr. SUTCLIFFE. Much higher than in this insurance?

Mr. GHIARDI. Yes. Take your solvency laws. Your bill on solvency laws produced action in 20-some States within a year. The McCarran Act. When Congress said put your house in order or we are going to do it, I think the McCarran Act immediately produced a long series of reforms in the insurance laws.

I think there are more people in the insurance area that can bring influence to bear in the thing. I think highway safety has been left to too many other people in the States. I think it has been done the same way in the Federal Government, to some extent. They are now starting to put some money into highway safety.

They are starting to look at the roads, the standards and things of this sort. Let's put in some new standards for driving. You are going to have to have a physical examination every year after age 65. Then we start looking around at all our drivers, and so forth, and the policy-makers, and that, and we certainly have a different problem there.

I think it's a factor and we have got to admit that there is a failure there. The media is so concerned with no-fault. If they put half the effort behind safety programs we would have better action. If our citizens' committees did, we would have better action. But we haven't quite gotten to that point.

We are now starting to see seat belt development with a little bit more pressure from the media, from advertising people and things of this sort. I think that is the answer to your question.

Mr. SUTCLIFFE. The National Highway Safety Administration was created by an act of Congress in 1966.

Mr. GHIARDI. We are very aware of that and our proposal parallels many of those standards and says we would support those on a local level.

Mr. CURTIS. May I just tell a very little story that illustrates that. A judge before whom I was trying a case had a neighbor who came and complained about a car speeding on this street and endangering the children. Through his efforts as a judge of our Supreme Court he had a police officer stationed there. The first one arrested was her husband who was rushing to get to work. Then she was beating on his door with an umbrella.

That is what you find on safety. That thing is carried out through the whole State. The legislators, when they want to pass safety regulations, come across all sorts of things like that and they are constantly being badgered in their home areas by their neighbors on just such points.

Mr. SUTCLIFFE. I urge that on the completion of this hearing record you look to the information developed for this committee by the Library of Congress as to the success of adopting uniform laws to meet critical social needs, particularly in the area of insurance reform.

Perhaps you can evaluate whether or not we have some similarity between insurance and legal reforms as well as safety reforms.

Thank you very much.

Senator HART. Again, thank you very much for your patience and your appearance here.

(The statement follows:)

#### STATEMENT OF WILLIS SMITH, JR., PRESIDENT, DEFENSE RESEARCH INSTITUTE

##### INTRODUCTION

My name is Willis Smith, Jr. I am the president of the Defense Research Institute. Also present are Samuel J. Powers, Jr., president of the International Association of Insurance Counsel; William E. Herod, president of the Federation of Insurance Counsel, and Reid A. Curtis, immediate past president of the Association of Insurance Attorneys. We appreciate the opportunity to appear and to express our views.

The Defense Research Institute is a national, non-profit organization with almost 6,000 members, headquartered at Milwaukee. Nearly all of our members are trial lawyers who come from all fifty states, Puerto Rico and Canada. These lawyers defend civil lawsuits and, in turn, are members of firms which comprise over 20,000 lawyers.

The Defense Research Institute was organized in 1960, through the efforts of the members of the International Association of Insurance Counsel, as a research and educational institute to promote improvement in the administration of justice and to enhance the service of the legal profession to the public. All of the lawyer members of the International Association of Insurance Counsel, organized in 1920, the Federation of Insurance Counsel, organized in 1936, and the Association of Insurance Attorneys, organized in 1935, are members of the Defense Research Institute. All three organizations have similar aims and objectives.

##### STUDY OF AUTO REPARATIONS

Our interest in the so-called "Auto Accident Reparation Controversy" arose at the inception of the discussion and debate of the subject. We soon saw that the matter had many facets which some persons tended to confuse and group together. In addition to questions relating to the operation of the legal system, there are also questions relating to insurance marketing, underwriting, rating and the like. These issues are separate and need separate attention. Our expertise is in the legal area. Even though the issues and problems posed are complex, simplistic solutions are being offered with the claim that they are panaceas.

We have found an almost complete lack of public understanding of the issues involved and of the alternatives being offered. This is illustrated by a Gallup Poll released late in April in which 1519 adults in more than 300 localities were questioned about auto reparations. Only four in ten responded that they had heard of so-called "no-fault" auto insurance. Only 19 percent of this 40 percent claimed that they understood "the plan." Eighty-one percent of that 19 percent, when asked if they approved or disapproved of "the plan," reported, according to Gallup's classification, that they were "uninformed or undecided." This poll supports our belief that people generally have never heard of "no-fault" insurance, do not understand the concept if they have heard of it, and are totally unknowledgeable concerning the shortcomings of the various proposals. We submit that proposed changes in the "fault" system are not supported by any public demand and are filing with this statement, as Exhibit A, a copy of an article,

*Surveys, Attitudes And Propaganda*, which was published in the April, 1971 issue of the Insurance Counsel Journal.

Because of all of this, we determined to study those problems which were within the range of our expertise as lawyers and to develop recommendations for solution. Almost before our work began, an unfortunate situation developed. Some who called for change of the present system claimed that anyone who opposed them must be blinded by self-interest. Some within our ranks urged us not to get involved because such criticism might be damaging. This committee should be aware that the defense bar, particularly those segments of the defense bar represented by the leadership of our four organizations, are of the opinion that their practices would not be seriously affected by the adoption of most of the auto reparation plans and proposals that have been offered. In fact, the defense bar could have an increased volume of work imposed upon it because of the amount of litigation needed to interpret the types of coverage which the new proposals are intended to provide. However, we firmly believe that the motoring public would be irreparably harmed by these proposals.

#### STUDY OF VARIOUS PLANS AND PROPOSALS

As part of our work, we studied the various plans and proposals which have been offered for change or modification of the present system of automobile accident reparations. It has been estimated that over fifty plans and proposals have been offered to date. When the legislative variations of the same plans are considered, the number may be closer to one hundred.

##### *"No-fault" an imprecise term*

Even though there are so many plans and variations of them, the media, in an effort simplify the issues for the public, has created the impression that there is only one clear-cut proposal which is being offered as an alternative to the present system. We constantly see reference to "the no-fault plan." In fact, the Gallup Poll to which I referred earlier asked as its first two questions: "Have you heard or read about the 'no-fault' plan dealing with auto insurance?" and "What is your understanding of this plan?" The term "no-fault" has been so misused that it no longer has any real meaning other than to describe one of the numerous insurance schemes by which a person insures himself against some form of loss he himself has suffered. Thus, "no-fault" can be used to describe medical payments, collision and comprehensive coverages precisely written as part of an auto policy, as well as any of the wide variety of plans and proposals suggested to change or modify existing auto insurance coverages.

In the context of our discussion today, it would be more precise to refer to the various plans which have been offered for auto reparations by three terms: (1) Complete Self-Insurance Proposals, (2) Limited Self-Insurance Proposals, and (3) Reform Recommendations.

Complete Self-Insurance Proposals include those plans such as S945, the American Insurance Association plan, the Rockefeller plan and others which would abolish the concept of individual responsibility, or almost completely abolish it, and which would compel each motorist to insure himself against the carelessness and recklessness of other highway users. The Limited Self-Insurance Proposals, such as the plans proposed by the National Association of Independent Insurers and the American Mutual Insurance Alliance, require motorists to protect themselves against certain economic losses but shift that loss to those who cause it and allow the innocent accident victim to pursue his legal remedy against the reckless or careless motorist. Finally, Reform Recommendations, such as those developed by the four defense lawyer groups represented here, the American Bar Association and others, seek to improve the present tort system—to make it more efficient, more equitable and less costly—within its present framework. Included in this category are reform proposals which have been instituted by the insurance industry in claims handling, rating, cancellation, non-renewal standards, and the like. These definitions are over-simplifications but they serve to place the balance of our testimony in a proper framework.

Our position on the general concept of self-insurance for auto accident reparations was clearly expressed in a statement by our former Board Chairman, Mark Martin, which was filed with the Senate Subcommittee on Antitrust and Monopoly Legislation on December 16, 1969. Copies of that statement, which we published under the title "Automobile Accident Reparation: This Road Toward Reform!" are filed with this statement as Exhibit R.

*S945—Compulsory insurance*

We are of the opinion that Complete Self-Insurance Proposals are not in the public interest and would not solve the problems they seek to correct. Copies of our Analysis and Critique of the American Insurance Association plan (Exhibit C) and the Rockefeller plan (Exhibit D) are filed with this statement. Because of the subject matter of this hearing, I will specifically discuss the reasons why we are opposed to S945. First, this plan calls for compulsory insurance. It would force all motorists to buy a form of accident and health insurance. The experience with compulsory automobile insurance in Massachusetts, New York and North Carolina does not instill confidence that a similar system should be enacted in all fifty states.

Motorists would be forced to buy this accident and health protection whether or not they needed or wanted it. This compulsion exists in the face of statistics which show that close to 80 percent of the population is protected by medical and hospital insurance and that over 75 percent of our labor force is protected by some form of wage continuation plan. These insurance and benefit plans pay for losses regardless of the type of accident, injury or illness that is involved. We would remind the committee that surveys clearly illustrate that the public has much dissatisfaction and the greatest number of complaints about its treatment under accident and health insurance. Now S945 wants to place the motoring public in this same position.

*S945—Excess insurance*

S945 lives on the collateral accident and health plans which are available to accident victims. It provides that payments under the plan will be reduced by the various insurance and benefit payments an injured person is entitled to receive from most other sources not connected with auto insurance. Thus, it would force many persons to buy insurance that is unneeded. It would force them to pay premiums for that unneeded insurance. Then, it would deny benefits to a person because he was prudent enough to protect himself and his family by the purchase of insurance and benefit plans which provide protection for every possible contingency—not merely auto accidents. This, of course, would only reduce the cost of auto insurance until those who provide the collateral sources make auto insurance primary by their contract terms.

It may be argued that it is necessary to have a plan such as S945 to supplement coverages provided by existing collateral accident and health plans. However, analysis of the DOT report entitled "Automobile Personal Injury Claims" reveals that of the 26,820 claims which were closed by insurance companies during the two-week study period, only 4.8 percent of the claimants had economic losses of \$2000 or more. The statistics noted previously prove that most claimants now have first party coverage for this loss.

*S945—Cost*

It is suggested that S945 would save money for premium payers by reducing auto insurance costs. As lawyers we do not claim to be skilled in actuarial science, but there are some observations which we can make.

(1) There is disagreement even among insurance actuaries as to whether the Complete Self-Insurance approach, or any particular plan, will result in lower cost. The actuaries, however, do agree that the problem in trying to cost such a plan lies in the fact that the lack of experience with this approach forces the use of many assumptions to arrive at a cost estimate. If the assumptions are not accurate, or do not prove to be accurate in actual practice, the estimate will be wrong. We would urge that the proponents of any plan who seek its support by claims of reduced cost be required to prove, by a preponderance of the evidence, that costs would actually be reduced.

(2) Even if S945 would result in lower insurance cost, the question is whether true or artificial cost savings are produced. The plan does not attack the root causes of auto insurance cost; rather, it seeks to reduce cost by redistributing and reducing benefits. As mentioned previously it lives on other insurance and benefit plans by refusing to pay benefits until the accident victim has used up collateral benefits. Thus it imposes a victim tax upon our prudent citizens. This saving could prove illusory. S945 also limits recovery to so-called "economic loss." In the case of economic losses such as income loss or the pecuniary loss suffered by a dependent of a person killed in an auto accident, artificial limits are established. Only 85 percent of income loss is paid up to \$1000 a month for 30 months and a ceiling of \$30,000 is established for death benefits.

(3) S945 reduces cost in a cavalier fashion by denying compensation, in most cases, for the pain, suffering and inconvenience suffered as the result of the carelessness or recklessness of another. Implicit in the denial of compensation for general damage in most cases seems to be the suggestion that there is something immoral about compensating a person for anything but a loss for which a signed receipt can be produced. Thus, a second victim tax is imposed by forcing a person who undergoes pain, discomfort and inconvenience as the result of another's conduct to bear that loss in stoic silence. The reason, of course, for eliminating this form of compensation is so that it will be economically possible to compensate those persons who cause accidents as well as their innocent victims. They reduce costs by reducing benefits. We submit that the motoring public does not wish this manufactured cost saving.

Even with all of these restrictions, limitations, setoffs, deductions and other provisions to restrict the type and amount of benefits payable, there is no assurance that S945 or any Complete Self-Insurance approach to auto insurance will provide lower cost insurance. This fact was confirmed by Secretary Volpe in prior testimony before this committee.

With the restricted benefits offered by the plan, S945 ignores one of the most costly items of the total auto insurance premium—coverage for damage to motor vehicles. It has been estimated that an average of 55 to 70 percent of the auto premium dollar goes to repair motor vehicles. There is nothing in S945 or any other Complete Self-Insurance proposal that would cut the cost of vehicle damage repair. Thus, savings in insurance premiums, if any, produced by the plan will only affect that small portion of the auto insurance premium paid for bodily injury coverage. We hasten to add that a first step in the direction of reducing vehicle damage cost is to be found in S976, The Motor Vehicle Information Act.

#### *S945—Inequity*

One of the most cruel myths which is being perpetrated upon the citizens of this country is that resort to a Self-Insurance scheme to completely replace the present system will produce greater equity. All too often reports appear in the media which assert that this or that "no-fault" plan will pay all losses sustained in an auto accident without regard to fault and without the need to seek compensation in a court. Because the stories are couched in general terms, no explanation is given of the fact that not all economic loss will be paid, that setoffs may be imposed, that pain, suffering, scarring, dismemberment and other general damages have to be absorbed by the victim or will only be provided for in one case out of a thousand. No mention is made of the fact that in addition to the compulsory coverages a motorist will be forced to buy, he will have to buy additional coverages, at increased premiums to fully protect himself. These additional coverages may include property damage liability coverage, collision and comprehensive coverages, personal injury liability coverages, and extended first party coverage to supplement the minimum limits offered under the basic plan.

These are the reasons we oppose S945 and other Complete Self-Insurance proposals. As noted previously, Exhibits C and D more fully explain our reasons. Though the plans differ in some respect from S945, they are similar enough for a clear understanding of their common shortcomings.

#### *S945—Impact on highway safety*

I have said before that the term "no-fault" is not a proper designation for these plans. In actuality the term "no-responsibility" would be a more apt description. If such a plan were enacted, persons would still drink and drive, speed or pass on hills; the only difference would be that careless and reckless motorists would not be held responsible for their conduct. Proponents of these "revolutionary plans" must assume the risk of increased carnage on the highways if they inform the American motorists that they are no longer responsible for their conduct behind the wheel of an automobile. Proponents have brushed this question aside or have tried to assert that it is not the driver, but his environment, that is responsible for most accidents. Lawyers who have seen the human misery caused by careless and reckless conduct behind wheels of high-powered vehicles can easily dispute such assertions. However, we sought to study the issue and to produce more than self-serving assertions.

In a thoroughly documented study, Lawrence Lawton, a long time traffic consultant from New York, has demonstrated that the present liability system supplies all possible deterrents to improper driving. He asserts that the adoption of a

Complete Self-Insurance approach to auto reparations would remove these deterrents and produce more accidents and a resultant increase in the deaths, injuries and economic loss on our highways. A copy of the summary of Mr. Lawton's work, "Fault—A Deterrent To Highway Accidents," is being filed as Exhibit E with this statement. Just recently, the Lawton research has been reinforced by the independent work of a well-known and highly respected psychologist, Dr. James Mancuso, of the State University of New York at Albany. His paper, "The Concept of Culpability: Its Utility in Promoting Proper Roadway Use," will be published shortly and will be made available to this committee if it wishes to examine his work. This expert in motivation warns public policy makers to avoid substituting radical change in the area of auto reparations for proved social policies and indicates that such action could result in social losses that far outweigh social gains.

#### THE PROPOSALS OF RESPONSIBLE REFORM

In addition to studying the various plans and proposals which would change and modify the present system, we sought to determine the problems which actually exist in the operation of the present system and to develop solutions to those problems.

##### *State action*

At the outset, a determination was made that if change is to come it must be approached at the state rather than the national level. Here, we are in accord with the recommendations of Secretary Volpe and the Department of Transportation. Not all problems have a national solution. What is beneficial for the citizens of the state of New York is not necessarily beneficial for the state of Kansas. Claims that the states will not act are totally unfounded. As can be seen from Exhibit F filed with this statement, 33 of the state legislatures which are now in session have various plans for automobile accident reparations before them. Carefully note that plans being considered vary from state to state. This demonstrates that legislators at the state level are concerned with developing a system that is in tune with the peculiar needs of their citizens. Auto reparation at the state level allows for experimentation and modification. As you are aware, a limited self-insurance plan became operative in Massachusetts on January 1 of this year. It is too early to tell how that plan will operate over the long pull, but it certainly should produce the experience and data needed to evaluate the feasibility of other proposals. Consideration of radical change should await this data. We would call the committee's attention to the Automobile Accident Insurance Act which has been in operation in the Canadian Province of Saskatchewan since 1946. The experience there does not make a case for radical change.

Because of our belief that state action is the essential course to follow in auto reparation reform, we sought to develop flexible proposals which could be implemented at the state level depending on the needs of the citizens of a given state.

Our initial work led to the development of the proposals found in our publication *Justice in Court After the Accident* which is filed as Exhibit G with this statement. That special report contains broad guidelines for improvement of the present system. We took the blueprint formulated in *Justice in Court* and developed specific recommendations in a Special Report, *Responsible Reform—A Program To Improve The Liability Reparation System*, filed with this statement as Exhibit H. The theory behind Responsible Reform is that the public is interested in a less costly, more efficient and more equitable auto insurance and reparation system. Though our action was prompted by the auto reparation controversy, many of the proposals in Responsible Reform, if implemented, would improve our entire system of jurisprudence. We hasten to point out that our proposals and research are offered for consideration and use in various states. As an organization we are not soliciting its adoption in any state.

##### *Reduced cost*

It goes without saying that the public is interested in less costly auto insurance. Even though the authors of a DOT report, "Price Variability In The Automobile Market," found that the national average price paid for automobile liability insurance (bodily injury and property damage, all limits, one-year protection) was \$70, we believe that something can be done to reduce insurance cost. The question is how the cost should be reduced. There is little doubt that cost can be

reduced by eliminating or reducing benefits—this is an artificial cost saving. We developed proposals that would yield real auto insurance cost reductions.

The last few weeks have seen many of our citizens marching in the streets of this city demanding our disengagement from the war in Vietnam. Those who protest our involvement claim that we have wasted too many human lives and too much of our nation's monetary resources because of our presence there. Yet, more persons are killed and maimed on our nation's highways in one year than the total number of our servicemen killed or wounded during our entire operation in Vietnam. Just as an end to the war will produce the only true saving in our nation's human and economic resources, no meaningful savings can be made in auto insurance costs until something is done to reduce the carnage on our highways. The Department of Transportation tells us that upwards of 25,000 persons are killed each year because of the involvement of alcohol in motor vehicle use. Yet, the ineffective laws dealing with drinking and driving indict legislators who are sworn to protect the public.

Those who advocate the Complete Self-Insurance approach to auto reparations, such as S945, are concerned only with results of automobile accidents. We determined to attack the root causes. The family and friends of those who are killed or injured by an intoxicated driver, or drug addict or a habitual traffic law violator would not be impressed by arguments that it is hard to tell who is at fault for most auto accidents or that the careless or reckless driver should be compensated as the equal of his innocent victim.

We believe that driving is a privilege and not a right; therefore, we have made a number of proposals to deal with accident producers. We believe that licensing laws should be used to remove incompetent and dangerous vehicle operators from the roads. Insurance rating and underwriting should not be relied upon as a means of removing highway menaces by governments which shirk their obligation to protect the public. We have proposed legislation for mandatory license revocations and fines for those who are convicted of driving while under the influence of alcohol or drugs and for the permanent revocation of the licenses of those who are habitual traffic law violators.

We also believe that persons should not be licensed to drive who are unable to safely operate a motor vehicle and that licenses should not be renewed if a motorist is blind, deaf or otherwise incompetent. We have proposed uniform licensing standards with periodic examination for driving competence.

Many persons are not using safety equipment now installed in vehicles. The use of this equipment could save much human life, and suffering. The National Safety Council has estimated that over 10,000 lives could be saved each year if seat belts, which are now standard equipment in all cars, were used. We have proposed legislation for the mandatory use of motor vehicle safety equipment including seat belts and motorcycle safety helmets.

As additional items leading to cost saving we have proposed in Responsible Reform to control contingent fees, to modify the Collateral Source Rule, to control fraudulent claims and to promote efficient use of the legal effort. Each proposal, if implemented, would reduce cost without resorting to artificial measures.

#### *Expediting claims settlement*

A number of proposals found in Responsible Reform are concerned with prompt payment to persons who are injured in auto accidents.

We wish to make it perfectly clear that we favor having first-party compensation for economic losses available to all persons injured in auto accidents who need or want such coverage. As noted previously, the great majority of our citizens now enjoy this protection from sources other than auto insurance. However, we are firm in our belief that the compensation should not be funded by depriving innocent accident victims of their right to receive full and complete compensation. Responsible Reform proposes that every auto liability policy covering a private passenger vehicle on a non-fleet basis provide minimum stated coverages without regard to fault. This coverage would include medical, hospital and related expenses, income loss and an accidental death benefit. In addition, uninsured motorist coverage would be required. These coverages would protect the named insured, members of his family residing in his household, and other occupants of the insured vehicle.

We differ in our approach to this coverage from those who propose Complete Self-Insurance. First, an insured who believes that he and his family are adequately protected by other insurance and benefit plans would not be forced to buy this coverage which for him would be unnecessary. He could reject this coverage as it affects himself and members of his household. He could not reject it

as it affects other occupants of his vehicle. They would be protected by their host's insurance unless they were afforded similar coverage by their own insurance.

Believing as we do in state-by-state evaluation based upon need, we did not set forth the coverage limits in our proposal. This can best be determined by the needs of the individual states. We cannot use the cost criteria of Washington, D.C. for Sheldon, Vermont.

Responsible reform would alleviate the problem of court congestion and delay where it actually exists. Our studies show that court congestion is limited to a small number of metropolitan jurisdictions and that auto accident cases are not the cause of delay. This is confirmed by the DOT study, "Automobile Accident Litigation," which found that only 17 percent of court time is spent on auto litigation and that delay in urban courts reflects the priority given to criminal as opposed to civil litigation. Delay is caused by the failure of our courts to keep pace of population growth and the explosion in the enforcement of individual rights. For this reason we have proposed the creation of new judgeships based upon population growth. We believe that persons accused of crime have the right to a speedy trial, but we also believe that tax-paying, law-abiding citizens have the right to a prompt disposition of civil litigation in our courts. Barring certain types of litigants from our courts to ease court congestion, when improved and modernized courts and procedures are called for, is a stop-gap measure which will only compound our social problems. It may be that \$945 would produce a reduction in the workloads of state courts. However, the question is whether the reduction will be due in large part to a shift of cases to the federal courts. As a federal act or law, many questions as to coverage and interpretation would be within the jurisdiction of the United States District Courts.

Responsible reform also calls for the implementation of an arbitration plan for all cases in which the amount in controversy is \$3000 or less, to be heard by panels of attorney-arbitrators. The procedure calls for a trial de novo in the courts if any party disagrees with the findings of the arbitrators. This procedure frees court personnel for other matters and, since the hearings are conducted in the arbitrators' offices, does not call for the use of courthouse facilities and personnel. This procedure is now working well in Philadelphia, where court delay for claims of \$3000 or less was reduced from 30 months to 30 days. It is now being expanded in that city on a voluntary basis to cases involving amounts between \$3000 and \$10,000, and it is being experimented with in other states.

We also believe that the insurance industry is doing much to expedite claim settlement with its advance payment programs and responsible reform contains a proposal to aid insurers in continuing and expanding this process. Much change has taken place in the past few years to improve the reparation system, and the advance payment technique is just one example. Unfortunately, as these procedures and changes are woven into the evolutionary process of the system, critics use data three, four or even five years old as arguments for their own proposals.

#### *Efficiency and equity*

Responsible reform also proposes to improve the equity and efficiency of the present system. There has been considerable debate over the merits of adopting a system of comparative negligence to replace the rule that contributory negligence is a complete bar to recovery. We have proposed that those states that wish to change their rule should adopt the Wisconsin rule and procedure for comparative negligence.

Before the current legislative sessions began there were 13 states which had adopted the comparative negligence rule. At the present time comparative negligence statutes are pending in 21 states. It is reported that Idaho became the 14th state to adopt a comparative negligence rule just last month. This also indicates that the states are acting to improve their reparation systems.

We have also made proposals in responsible reform for the modification, addition or elimination of a number of legal practices and procedures to make the present system as efficient and effective as possible.

#### *Future development and modification*

These then are the specific proposals of responsible reform. We are also pleased to note that proposals from responsible reform are appearing in the plans and proposals offered by other individuals and groups and are finding their way into various state houses as legislative bills.

When Responsible Reform was issued in October of 1969, the four sponsoring defense lawyer organizations made a commitment to re-examine our recommenda-

110 NOV 17 1969

tions in light of future developments and to modify and change our recommendations if evidence dictated that such action was in the public interest. A DRI committee is working on this task and we expect to be able to report on its activity after our Board meeting which will be held during the first week in July.

I referred previously to the so-called Limited Self-Insurance Proposals, such as those recently prepared and offered by the American Mutual Insurance Alliance and the National Association of Independent Insurers. The real, basic difference between those proposals and Responsible Reform lies in the fact that the limited plans established formulae for the determination of damages for pain, suffering, inconvenience and other elements of non-economic loss, usually referred to as "general damages." These proposals, the Massachusetts plan and other proposals of a similar nature are being carefully studied. A recommendation as to modification, if any, in our position on the subject will be contained in the June 29, 1971 report of the committee to be made to the DRI Board of Directors.

#### CONCLUSION

At the present time, the Congress has before it two proposals relating to automobile accident reparations. One, S945, calls for the almost complete elimination of the present system and the establishment of a Federal Complete Self-Insurance auto reparation approach throughout the country. This would be dictated without regard to the needs or wants of the citizens of each state. The other, the Concurrent Resolution recommended by DOT, would allow state legislators to determine the type of reparation system that best suits the needs and wants of their citizens. We favor the latter approach. We do not believe that all problems must have a national solution or, for that matter, that the auto reparation problems in all states are similar and call for a national solution. There is no particular virtue in uniformity, or the administration of a national insurance plan.

Allowing the individual states to act allows for flexibility, study and cautious evaluation. With all the uncertainty that has been expressed as to the actual impact that a change in the auto reparation system will have, state action is the most judicious approach to the problem. The states are acting and they are acting now.

We believe that it is possible to improve the present system—to make it more equitable, more efficient and less costly—all within its present framework. We have found no groundswell of public opinion for elimination of the principles of individual responsibility and individual accountability upon which the present system is based. We have found no groundswell of public opinion for the position that one who is injured or has his property damaged through the carelessness or recklessness of another should be forced to shoulder his own loss. It is quite true that the public wants less costly auto insurance and a more equitable and more efficient reparation system. However, it has not been proved to any degree of certainty that the Complete Self-Insurance Approach will satisfy the public's wants in those respects.

We have conducted our studies, and we continue them. We have pointed to the problems and difficulties which would result from the implementation of certain plans. We have developed our proposals to improve the system. We have not fashioned a panacea. Problems do exist and will continue to exist in the operation of any reparation system. Accidents will continue to happen. Our citizens will be injured no matter what type of plan or proposal is in operation. We suggest that in an attempt to solve certain problems, we do not create others which are more difficult to solve. We wish to assert that as lawyers we have a responsibility to protect the public interest and we can only do this by perfecting and maintaining the principles of individual responsibility and accountability.

Senator HART. Now, Miss Joyce Capps from the Women's Bar Association of the District of Columbia.

Miss Capps, you have been very patient with us.

**STATEMENT OF JOYCE CAPPS, REPRESENTATIVE, WOMEN'S BAR  
ASSOCIATION OF THE DISTRICT OF COLUMBIA**

Miss CAPPS. I enjoyed it, Senator.

Senator Hart, my name is Joyce Capps. I am appearing as a representative, at the request of the president, of the Women's Bar Association, a group of which I am a past president. It is an organization that is comprised of approximately 400 women attorneys. It is the oldest and largest women's bar association in the country.

I know the Senator and his group here must be as tired as I am, so I would just like to submit my statement for incorporation in the record.

Senator HART. It will be received and printed in full.

Miss CAPPS. I enjoyed the discussions more than the presentation of statements here this afternoon because I think it is a good way to clear the air. That way we find out what the Senators are interested in on behalf of the committee and perhaps with our experience we can aid the Senate by answering questions.

Senator HART. I would encourage you not to worry about the time. Having spent most of the day with us, if you would like to make some comments or react to certain things you have heard, we would appreciate it.

Miss CAPPS. Senator, at the outset, I would like to state that we are opposed not only to this bill, the Hart bill, but any no-fault bill, for all of the reasons that have been given today by these various organizations. There is the unfairness of it, the application of the anti-discriminatory aspect of it at the outset.

Why separate automobile accident victims from victims of other types of accidents or diseases? A person that is injured as a result of an accident is just as injured, suffers the same pain, suffers the same economic losses, inconvenience, discomfort, and anxiety as they would suffer from any other type of accident.

By analyzing the bill and any no-fault bill, we are of the opinion that it is taking away the rights of innocent people and creating rights for the people who cause the accidents. We think it is far better to fully and completely compensate the innocent victim first.

I think comparative negligence is important in this line. I wish we had it here in the District of Columbia, but we don't. I think it would be much fairer.

Another thing we are shocked by, at least some of our members, is this net economic theory that is incorporated in your bill. Many people are prudent enough and provident enough to provide for their family by paying the premiums that are required on loss-of-income policies and health insurance programs.

Another example is your Government workers here with their annual and sick leave. Some of these Government workers save this leave. They are almost hoarders. They just save it. Those are the types of workers you want, of course, people that don't abuse programs like that and they save it for a time when they need it.

This is an economic loss in this respect, Senator. If a person has annual leave piled up, he gets paid for that if he ever does leave the Government service. The sick leave he doesn't get paid for, but say he were to transfer from one Government agency to another Government agency. This looks good on his record if he is transferring, a large amount of accumulated leave. This is not an intangible in my opinion. I think this is a very tangible asset for a person to have. For someone else to benefit by it rather than the innocent party, I fail to see the logic of it. I fail to see the fairness or the equity.

I am not going to go over my little statement. It is only four pages and I don't want to waste the Senator's time. But I would like to make some comments about some of the questions you asked some of the others who were here today.

Senator, I represent a lot of cab drivers in this town. Nobody in this whole world can convince me that people do not drive carefully because of insurance. They do. They are concerned with that insurance. There are bad aspects in the insurance industry, and I am glad the Federal Government is trying to do something about it. But I don't think it should be done while you are infringing on the rights of innocent drivers.

Some of these hackers will come in, you know, and maybe they have had an accident. It wasn't their fault. But lo and behold, they were involved in one just 6 months before and they were rear ended. Again, it wasn't the driver's fault. But you can bet your gumdrops when his policy comes up for renewal it is not going to be renewed. I think this is very unfair.

After he has once been turned down on a renewal, there is no other company in the world that is going to touch him. So I think they do drive carefully.

Senator HART. I would tend to agree with you that this is a category where the insurance factor may indeed be a restraining influence.

Miss CAPPS. I think another instance is our children. You know, when they are thinking they are grownup and they have got the family car, I think they will be more careful. They know that daddy is paying a higher premium in order to let junior drive.

Senator HART. You represent cabbies and I won't quarrel with you as to what insurance means to a cab driver. I have got eight children and three cars. I don't buy your theory with respect to that.

Miss CAPPS. Don't you think your children are more careful driving because you have those added premiums?

Senator HART. No.

Miss CAPPS. And perhaps they might cancel you if the kids get in trouble?

Senator HART. No.

Miss CAPPS. They might, Senator, cancel you.

Senator HART. I think they are more deterred by fear of getting hurt or not having the car next week because it is in the shop getting fixed.

Miss CAPPS. I think it can be deterrent, though, for a lot of people to try to be careful drivers. You asked also if we had to have some kind of no-fault (which of course, we don't want) we would prefer a uniform Federal law? I agreed with the gentleman who said he saw no virtue in uniformity. I don't either because the needs of the

States are all different. That is, of course, why we have States' rights and autonomous State governments and things of this sort.

Another reason to be in opposition of this bill is that I don't see the reason for it any more. You know, I would have seen more reason, perhaps, for this bill 3 years ago than I do today. I am thinking of the court congestion and things of that sort. I think that court congestion became such a big word that it was almost public hysteria. There was the *Washington Post* doing their articles, and so forth. This had an impact. I think the Court Reform Act was a good thing.

I am down there just about every day and I have noticed many improvements there. This bill says, in a way, that the courts can't take care of their own problems by handling their workload. I don't think that is fair, Senator Hart. I think you are underestimating the boys who wear the black robes because they are doing a tremendous job down there. They are working long hours.

The Government has given us more judges, which is, of course, what we needed immediately. We are going to get more. There is no reason in the world why these cases cannot be handled expeditiously and well. Judge Green, the chief judge down there—I heard him in a speech down at the Greenbrier a few weeks ago at the convention of the administration of justice. He said it will take approximately 9 months from filing until final disposition of jury trial in a personal injury case. I think that is great. I think any sooner than that would really work to the disadvantage against the injured party.

I don't know whether I understand Mr. Sutcliffe's question or not.

Mr. SUTCLIFFE. I am not sure I did either.

Miss CAPPS. Did I understand you to say that there has been testimony before this committee about formalization for pain and suffering?

Mr. SUTCLIFFE. Actually in some of the insurance industry plans they will advocate the formulization of pain and suffering recovery. In fact, the testimony of the Defense Research Institute suggested there be a formalization for recovery of pain and suffering.

Our question was how you determine, if you are going to determine, where at the lower end of the intangible loss spectrum you are going to have a cutoff in order to avoid spurious intangible loss recoveries and thus make better use of the dollars collected by paying those people who are seriously injured.

Miss CAPPS. Under this tort adversary system we have had the juries doing it, 12 men true. Now down here we have six. But they are a very sophisticated bunch. You would be surprised when you get 12 men there together with all of their experiences. They are hard to fool.

Mr. SUTCLIFFE. I have no question about the viability of the jury system.

Miss CAPPS. When you demand a very low award, that is what you are going to get.

Mr. SUTCLIFFE. Some of these cases are not taken to trial because of the cost to the insurance company of processing the claims. Because of their nuisance value they are paid at prices higher than a group of 12 intelligent men would have afforded recovery.

Miss CAPPS. Maybe I am never in the happy position of having clients who will give them nuisance values. It seems like I can't settle

a case for beans in this town. You would want it to work, then, similar to workmen's compensation? You know, they have formulas.

Mr. SUTCLIFFE. We are inquiring into the methods of trying to reform the very system that you have mentioned and it presents some problems.

Miss CAPPS. I would like to present this fact as a little food for thought. I do some workmen's compensation, too. I would rather any day take a personal injury case, file suit in court, and in the District court here you can have your trial within 3½ to 4 months.

I have got workmen's compensation cases where there is very little involved and have been struggling for the last 2 years. I have got three on my desk right this minute. That is not the expeditious system that many people think it is.

Mr. SUTCLIFFE. We would agree with you and this is why we are trying to get most of the cases handled on a personal, first-party basis between the individual and the insurance company, having them pay for losses that occur and be done with it.

Miss CAPPS. It sounds good on paper.

Mr. SUTCLIFFE. We recognize there will be areas in which there will be disputes either as to the amount of damages or as to whether or not there was causation entitling the person to recover under the policy. In those cases we are asking what mechanisms would facilitate the recovery and get money into the hands of the injured person in the quickest possible way, and in the fairest and most equitable way.

Miss CAPPS. I am a great believer in arbitration. I love arbitration. I haven't had too much experience with it because it is still a fairly new animal, but under the uninsured motorists coverage they require this arbitration. My experience there has been great. But, of course, you do get your pain and suffering but it does do away with these delays you were talking about.

Now, I quarrel with the allegations of delays in our city. I don't think we have them in the District of Columbia any more. We did have a few years back but I think it is clearing up very well. Arbitration, I think, is great for your small cases. I think this catastrophic harm test is outrageous. When you think of a poor man whose leg is chopped off, the surgeon's bill could be \$75. This is not fair.

Mr. SUTCLIFFE. But we also think the fact that in our present system it is outrageous for people who have \$25,000 of economic loss or more, and they go to trial, that the average recovery is one-third of their economic loss. Forget the intangible loss. They do not get it and only 45 percent of all seriously injured victims recover. The other 55 percent do not get a dime from the tort liability system.

Miss CAPPS. You mean the people who were at fault? You know, a lot of counterclaims are filed just as a tactic.

Mr. SUTCLIFFE. No, these statistics are based upon the injured population, the number of people injured in automobile accidents. The 45 percent figure for recovery is based upon the Department of Transportation study. That means 55 percent receive no recovery from the tort liability system.

Miss CAPPS. Under your bill look how little anybody gets. Hardly anybody would get anything under your bill. I hate to say it but it is true.

Mr. SUTCLIFFE. Let me explain because you missed the opportunity to hear an exchange this morning. Under the bill presently drafted approximately 99.6 percent of all claimants will receive total compensation for economic loss, including lost wages, with no limitation for medical pay and rehabilitation costs and other economic loss for replacement services.

In addition, the people in the category of permanent injury, could recover all of their intangible loss through the tort liability system. The people not covered under this bill is in that area between some level of injury and permanent injury.

Miss CAPPS. I do not understand that last remark you made.

Mr. SUTCLIFFE. We are covering with the tort system, under the label of catastrophic harm, those people who suffer permanent injury. We are not covering—

Miss CAPPS. Yes, but your definition of permanent injury—but go ahead.

Mr. SUTCLIFFE. What we have not covered is 4.4 percent of the injured population. We are not allowing them to recover intangible loss claims but we cover all, or virtually all of their economic loss claims. So you see the only gap in the system at the present time is in an area of intangible loss.

Miss CAPPS. Statistics can show anything. We know that from the ballpark. But I do not follow you. I take issue with you there.

Mr. SUTCLIFFE. In the ballpark a 0.500 batting average is a 0.500 batting average. The only kind of inquiry you can have—

Miss CAPPS. But it depends upon the umpire who is calling it a ball or a strike. Somebody has to call it.

Mr. SUTCLIFFE. It also depends on how many times he has been at bat.

Miss CAPPS. This is my point on that very issue. I forget what the figures were because our organization did not—we do not have the money to do all these studies. But if I remember Mr. Markus right, it was phenomenal—only 2 percent, I think, of all the injured victims that were permanently injured that went into court, if my memory serves me correctly.

Mr. SUTCLIFFE. He said 1 percent and the Department of Transportation statistics show that permanent injury amounts to 7.6 percent of all injured victims.

Miss CAPPS. That seems very high from my own practice. I have only been practicing 10 years but I would say around 2 or 3 percent probably is the more accurate figure, just from my experience. So you have got your 97 percent of the people whose main recovery is going to be for their pain and suffering. A woman could not scrub that floor or lift up her baby.

Mr. SUTCLIFFE. This is what was very interesting about the Department of Transportation study. Of the people injured in automobile accidents there were approximately 88 percent of the people were not what the Department of Transportation considered seriously injured. Their serious injury level was either \$500 of economic loss or 14 days of hospitalization. So you see when you compare the number of seriously injured, permanently injured, to those who would have a chance to recover intangible loss otherwise, you do not have a comparison between the permanently injured and the total accident population.

You only have a comparison between the permanently injured and the other category of people injured who would be eligible either through the tort system or whatever arbitrary line you may go for intangible loss recovery.

So rather than a relationship of, say, 3 percent to 97 percent, it is a relationship of 7.6 percent to 12 percent to the total injury population, or about 66 percent of the intangible losses are covered right now by the Hart bill and we are looking to see if we can recover the rest of the intangible loss.

Miss CAPPS. That uses a lot of the premium dollar to take care of the party at fault. We are against that. We do not care about the party at fault, especially in this day and age when there are so many collateral benefit sources for him.

Mr. SUTCLIFFE. You see, the seriously injured victim in the Department of Transportation study, on an aggregate basis, had \$5 billion of economic loss. Mind you, this is not talking about injuries; they only recovered \$2.5 billion of that from any source.

Miss CAPPS. That is from the permanently injured.

Mr. SUTCLIFFE. No; seriously injured.

Miss CAPPS. I quarrel with figures sometimes. We all do it. If you have got a serious case—now, I just want to give you this example because it is a real case. There was a 5-year-old out on his bicycle. He ran into a Schlitz beer truck. The front right wheel of the beer truck knocked him off his bike and the back tire of the truck literally went over the boy's chest. Luckily the bicycle, on top of the chest, kept him from being killed right then and there. This boy had very serious injuries.

He went to something like four or five different lawyers and they said, well, the liability is very bad, to say the least. By the time he got to a lawyer that finally expended the necessary money required to investigate the matter, sending an investigator out to see if there were witnesses around, this was a 2½-year-old case. Witnesses leave by that time. And it cost money for a lawyer to invest in an investigator to see if there is any liability that can be grasped there.

The lawyer filed the suit. It was a very touchy suit. There was not an offer, not penny one offered to settle that suit. Nothing for the medical and nothing for anything else. The parties involved, the little boy's parents, were on welfare so he was taken care of. But the boy will for the rest of his life have a tracheotomy tube in his throat. He was a deaf and dumb boy in the beginning, so it will impair him in learning to talk through Gallaudet.

When that case went to court I am convinced that there was not really liability there. You know what I mean by that. An injury could go either way. But there was the target defendant, the Schlitz beer truck. There was a dream of a little client, a little 5-year-old boy. He got something.

So you get these compromise verdicts. No, he did not get as much as he would have gotten had he been in the crosswalk and obviously it had not been his fault. So you get these compromise verdicts many times in very serious cases, because the lawyer has no alternative as a plaintiffs' lawyer but to file that suit. If there is the slightest chance in the world you go the full route, especially when you have got a dream client like a cute little 5-year-old kid with serious injuries.

So you get your compromise verdicts there. So when he says there is only this much recovery and that much recovery, we do not know how many of those were compromise verdicts. We just do not know. I venture to say many of them.

Mr. SUTCLIFFE. Of course this kind of compromise will take place more under comparative negligence operations.

Miss CAPPS. Yes, it would. I think comparative negligence is a great thing. I really wish we had it here. It would make it much easier to settle any kind of case if we had it here. When you are dealing with justice adjusters day in and day out they know what the burdens of proof are and all that. Of course the plaintiff's lawyer is a little bit worried because maybe his man was a teensy-weensy bit negligent, you know. So it makes settlement a little bit hard here in this jurisdiction but we do it.

All of us settle 9 out of 10 of our cases. It is an established principle that lawyers will settle their best cases, really. You settle your best cases because the insurance companies are willing to settle. They want to settle with you if it is a best case. They will settle with you. You don't have any trouble on those. It is your dogs that you have trouble with, where there is very sticky liability.

There may be hardly any special damages; you know, like a \$50 bill of a lady that has bad back trouble but it is not bad enough for an operation. She is the type that can tolerate a lot of pain. A lot of men don't want to be sissies and keep going back and forth to a doctor so they say, I can get my treatment at home. What do I want to go to a doctor for?

I think we should encourage persons who can treat themselves at home rather than padding the bills. A formulized pain and suffering thing would encourage padding bills, something that no reputable plaintiff's lawyer should do, in my opinion. You have to take the bills as they are submitted to you by your clients. If that formula were explained to them they would be running around getting bills, you can bet your boots on that. I don't think that is good at all. It costs \$75 for the surgeon to cut our leg off. And then the pain and suffering for that chopped off leg, having to go the rest of your life without it, based on 50 cents on the dollar. I don't get it.

Mr. SUTCLIFFE. I think the committee has received much testimony suggesting that that is not a very satisfactory way to determine who should or who should not be eligible for intangible loss.

In your experience as a trial lawyer in Washington, D.C., have you seen an abuse sometimes of the liability system where people will try to get intangible pain and suffering losses when they are not really entitled to them? Do you see this in your experience?

Miss CAPPS. I had one case in my 10 years, but I don't know how the other attorneys handled it. I have been a member of the Association of Plaintiff's Trial Attorneys for the whole 10 years so I am in contact with most of the plaintiff's lawyers here in town. Most of them feel as I do. We are too busy as it is. We don't want such a plaintiff's case—if I have the slightest indication that such a thing is involved. I can say I have a splitting headache and I might not have it at all.

Well, in a few instances I have doubted the credibility of my own client but I would rather find out than drag that thing through court and have the other side find out because I don't want to waste my

time. In the second place I don't want to ruin my reputation among the defense bar.

So you send that client, or I do, the few I send, to an orthopedic surgeon here in town that I know is going to give me a good report, a fast report. I get it back. If he says there is nothing wrong with that person then I don't take the case and I am stuck with a \$35 examination fee for that person but it is worth it not to take a case like that.

By the same token I have had many a case where a person would keep complaining they were hurting because their back was nagging and you think they are really making a mountain out of a molehill or something but you might be embarrassed 4 or 5 months later to hear from her daughter that she is in traction in such and such a hospital.

On contingent fees, I am speaking here on behalf of the Women's Bar. Most of the women lawyers here in town do not practice personal injury law. So they would have no interest whatsoever in contingent fee arrangements. But they also are for continuation of a contingent fee.

In theory they espouse all of the comments made by the American Bar Association almost right down the line.

And as a plaintiffs' attorney, of course, 90 percent of my living comes from contingency fees. I am a believer in it because I think a lot of people are represented that otherwise would not be. But I think the contingent fee arrangement should not be regulated by a Federal statute or even by a municipal regulation or a local statute. I think it should be by the court.

Your judge is the one who sees the amount of work you have done and should be able to assess a fair contingent fee. We have the contingent fees in your Federal Tort Claims Act and there the judges, of course, always set your fee. It cannot be over 20 percent in the Federal Tort Claims Act, but it can be less. The judges always set the fee there, and neither the plaintiffs' lawyers that I have talked to or the Women's Bar would be opposed to some type of limitation of the contingent fees.

Senator HART. Just one thing about the District of Columbia, and it relates to the bill that we are considering because it becomes mandatory for one who has a car to have insurance. It is my understanding that about a third of the drivers in the District of Columbia are not insured.

Miss CAPPS. I would agree to that probably.

Senator HART. At least to this extent there would be a public benefit as a consequence of the bill's requirement that you not register an auto unless you have it.

Miss CAPPS. Senator Hart, we are in favor of some aspects of your bill. I do not want there to be a misunderstanding here. I have directed my comments to the straight no-fault. We are tickled pink that you want to try to have some consistency about insurance policies and the cancellation of them and the renewal of them. I think this is good. This is real good. I am completely in favor of compulsory insurance.

I know a lot of trial lawyers disagree with me, but I would like to see that.

Now, I understand that the D.C. Bar Association right now has written a bill, I forget who introduced it, it was done this year any-

U. S. DEPARTMENT OF JUSTICE  
DIVISION OF RESEARCH AND STATISTICS  
WASHINGTON, D. C. 20530

way—of course, I am not on that negligence committee this year, so I have lost sight of it, but I know it has been introduced—our own uninsured motorist protection bill which is very good. It was worked on for 11 years by that committee, and it is a very good bill, and it is a step in the right direction. I still do not know what you are going to do about the drivers. Even if you have an uninsured motorist bill they will still get into somebody's car and drive it.

There is no way to really enforce these things except to make it rough on them when they are caught, and, of course, we are in favor of fair and stringent laws.

Senator HART. You are right, whatever law you pass, whether it is gun permits or mandatory auto insurance, there will be a guy that gets the gun and who has a car and a license for neither.

Miss CAPPS. Senator, could I ask you a question just out of curiosity?

Senator HART. But there is at least this benefit to compulsory insurance. If you condition titling of the vehicle on proof of insurance, you have got a lever.

Miss CAPPS. Right.

What would be wrong with just having a bill requiring mandatory liability insurance and your uninsured motorist and your medical payments coverage? Wouldn't that serve the purpose of your bill?

Senator HART. Well, at this late hour, all I can content myself with in reply is I think not.

Miss CAPPS. Because, you know, I was reading the bill and I could see what you were trying to do, but it seemed like to me it is just not the way to do it with all due respect to you. I respect you that you are doing something, but I wish you had been thinking about something else when you were thinking about some of these things, because I do not think they are workable or fair, and that is the most important thing. I do not think it is fair to do away with a centuries' old, time-honored, proud adversary system, and if the automobile cases go out the window, what is going to be next? You know, it kind of scares you a little bit.

Senator HART. I would say probably the next area would be one which has the social consequences that flow from the fact that so many people now do not get recovery under the existing system.

Miss CAPPS. You know what I would like to see, I would like to see a compulsory arbitration for something, say, under the \$1,500 case. But how are you going to determine what the \$1,500 consists of—your out-of-pocket expenses or that lawyer's valuation? He knows what a \$1,500 case is, taking into consideration the tangible out-of-pocket expenses and the type of injury it is, because you cannot have one without the other to determine value of a case.

Say, under \$2,000, \$1,500, compulsory arbitration, and that would take—you say two-thirds of your cases are the property damage, I think definitely the property damage cases could go out of court. I think the judges would appreciate that, and we have a tremendous volume down there, subrogation claims and things of that sort.

I think everybody would kind of like to see that, except they are always scared of the door opening. They say wait a minute, if we give in on that point then they will enlarge this, then they will raise the figure. Maybe I am just not as suspicious as some of my colleagues in the law. But I think it would be a good thing.

UNIVERSITY LIBRARY

Senator HART. Miss Capps, I have enjoyed the exchange, and I want to repeat again our appreciation that you were patient with us as the day went along. I begin to get the feeling when this record has been made together with the consideration that is going on over on the House side that all of us will have a better understanding of where the inequities are under existing practices and what change is most likely to respond to those inequities.

Clearly the bill as introduced by Senator Magnuson and me will be revised in light of the kind of record that we make here. So with you I hope at the end of these hearings we can say that we have made some improvements. Of course, I do not think anybody can claim perfection for a human institution, but improvement I hope will follow.

Miss CAPPS. I thank you for having me, Senator.

Senator HART. Thank you.

Miss CAPPS. Good night.

(The statement follows:)

STATEMENT OF JOYCE CAPPS, REPRESENTATIVE WOMEN'S BAR  
ASSOCIATION OF THE DISTRICT OF COLUMBIA

My name is Joyce Capps. I am appearing as a representative of The Women's Bar Association of the District of Columbia, and I am testifying today relative to Senate Bill 945. The following remarks are my views and those of my association on this subject of No-fault Auto Insurance:

We are opposed to the "no-fault" aspect of this bill because (1) it *abolishes* the basic right of the innocent victim of a negligent driver to be wholly and completely compensated for injuries sustained, while it *creates* benefits for the negligent and careless driver, and holds him harmless for the consequences of his wrongdoing, (2) by virtue of the "net economic loss" provisions, it prevents the injured person who was prudent enough to accumulate annual and sick leave and to pay premiums for accident, health, and loss-of-income plans from reaping the rewards of such prudence, (3) it discriminates against victims injured in motor vehicle accidents as opposed to other types of accidents, and (4) it particularly discriminates against persons not gainfully employed, such as housewives, children, and retirees, as well as the survivors in death cases. We consider the fourth objection to be especially unpalatable.

The unfairness and inadequacy of the bill are readily apparent when applied to situations. For example, an 8-year-old child is playing on the sidewalk. The drunk driver of a speeding automobile strikes a parked car, loses control and goes up on the sidewalk, strikes the child, and then crashes into a cement wall. As a result, the child sustains fractures to the femur and patella, a brain concussion, and traumatic epilepsy. She is hospitalized for two months during which time her leg is in a cast and for the first three days is in a coma. Even after leaving the hospital there are numerous return visits to the physiotherapist and doctor. Her residuals consist of a slight limp due to atrophy, several surgery scars, and epileptic seizures. Not until she reaches puberty can a prognosis be made as to whether her epilepsy will continue to be violent or will be such that it can be controlled with daily medication for the rest of her life. Under this bill only the "appropriate, reasonable, and necessary" medical expenses would be recovered. However, her parents would only receive \$1,000.00, because her father's family medical plan paid all but that amount. There would be no recovery for the excruciating pain and agony; or for the difficulty and frustrations in learning to walk with crutches; or the fear and anxiety of perhaps never being able to walk again; or missing a semester from school and the resulting embarrassment and humiliation of returning to school in a class behind her former schoolmates with children younger than she; or having to wear a corrective shoe to compensate for one leg being slightly shorter than the other; or not being able to skip rope, play dodge ball and all the other games little girls play; or the fear and embarrassment of blackouts and seizures which could result in further injury; or the headaches and muscular pain after a seizure; or in later years not being permitted to drive a car or operate any type of machinery, etc.

On the other hand, the drunk driver is a heart surgeon earning \$120,000 per year. He sustains injury to his wrist resulting in traumatic arthritis, and is unable to perform surgery. In addition to his medical expenses, he would recover \$30,000 in lost wages.

But the young housewife who sustains traumatic arthritis to her wrist and whose favorite pastimes are bowling, crocheting, and knitting, would not recover for her inability to perform normal household chores, such as scrubbing floors, washing windows, ironing, etc., nor for her inability to any longer engage in those activities from which she derived so much pleasure and enjoyment.

When a dog is struck by a negligent driver, his owner can recover only veterinarian expenses and the animal hospital costs. There is no recovery for the dog's pain and suffering because a dog is considered to be nothing more than personal property.

By the stroke of a pen this bill would abolish the fundamental concepts of human rights and dignity which for centuries have been inherent in our tort system—and would place an injured human being in the same position as an injured animal or a piece of personal property whose only compensation would be the amount of money required to patch him up again.

Furthermore, it is conceivable—and even probable—that this bill would create more litigation than it hopes to prevent. Legal interpretations and constructions will have to be made of the terms "catastrophic harm," and as to what constitutes reasonable expenses necessarily incurred, etc. Who makes the initial determination? Would the child in the example above have been able to recover all of her elements of damage had she been injured by a pipe falling from the back of a truck because it had not been properly secured?

Gentlemen, this bill is not the answer to the public concern about auto insurance. The answer lies elsewhere in such areas as court reform, more stringent licensing laws, better auto safety design measures, etc.

Senator HART. We adjourn to resume at 11 a.m. tomorrow in this room.

(Whereupon, at 5:25 p.m., the hearing was adjourned, to reconvene at 11 a.m., Thursday, May 6, 1971.)

SUMMARY OF ARGUMENT

The right to recover for personal injury is a fundamental right which cannot be abrogated without due process of law. A state cannot abrogate a cause of action for redress of injuries without substituting another, adequate remedy in its place. This statute unconstitutionally abrogates the rights of vast numbers of people to recover for human losses. The fundamental rights of large classes of persons have been confiscated without the substitution of any remedy at all since the abrogation of the right to recover for human losses is not dependent upon the availability of personal injury protection benefits. Even when available, personal injury protection benefits are hardly an adequate substitute since they prey upon collateral benefits presently secured to the overwhelming majority of accident victims and are reduced by these collateral benefits which victims have procured by other means and from other sources. Furthermore, to the extent personal injury protection benefits are payable, it will result in the tortfeasor being immunized from liability for special damages. This is not a substitute but a cruel fiction (pages 1-11).

This Act lies in a constitutional zone in which a statute is deemed to be violative of due process if its purposes could have been achieved by one or more narrower alternatives which would have been less restrictive of fundamental rights. This principle requires the legislature to employ "the narrowest workable means of accomplishing an end." The statute is unconstitutional since all of its possible purposes could have been achieved by alternatives which were less restrictive of fundamental rights. No rush should have been made to an unproven plan which denies basic rights (pages 12-20).

The statute is unconstitutional even under the standard that the legislation need only have a "reasonable relation to a proper legislative purpose." Again, a review of the statute's possible purposes demonstrates that the Act has no rational relationship to any conceivable legislative or community valued purpose (pages 21-29).

The statute cannot be sustained by drawing an analogy to workmen's compensation. The abrogation of common law remedies is elective under Workmen's Compensation. Under this statute, the injured victim is offered no such election or choice. The decisions sustaining the constitutionality of Workmen's Compensation rested on the idea that both employers and employees received advantages under the new system which could be balanced against the common law rights which they lost. This statute fails to provide an adequate substitute for the remedies it has abrogated. There is a great difference between the common law system for industrial accidents (and the desperate plight of workmen thereunder) which workmen's compensation was created to replace and the common law system for auto accidents.

The widespread theory prevalent at the time of the adoption of Workmen's Compensation was that by placing the cost of compensation on employers the cost would be passed on to consumers. There is no one in the auto situation who occupies a similar role--no one who could be regarded as being in a position to pass on the costs to consumers via the operation of market forces. The issue to which Workmen's Compensation is addressed is primarily that of determining terms and conditions of employment. The law, in effect, compelled the employer to provide, as a term of employment, an industrial accident policy for his employees. Unlike Workmen's Compensation, there is no contractual nexus on which auto compensation plans can build (pages 30-33).

The statute is violative of the equal protection guarantees of the federal and state constitutions. The equal protection guaranty proscribes legislation which classifies citizens by characteristics that are arbitrary or capricious, by characteristics that have no reasonable rational relationship to the legislative goal, and by characteristics that are manifestly beyond the control of the regulated persons. In addition, less legislative latitude is permitted when the statute affects a "fundamental right." In such circumstances, the courts demand an embracing classification which avoids any exclusion of persons whose inclusion would have been compatible with the legislative goal. Furthermore, if there is an "inherently unreasonable" classification or "suspect classification" the courts will require extraordinary justification for the statute. The Act is unconstitutional since it abrogates the fundamental right to recover compensation for injuries by classifications that are arbitrary, unreasonable and capricious and which invidiously discriminate against the poor--an "inherently unreasonable" classification (pages 34-37).

The Act's irrational classifications result in denial of equal protection to tort victims suffering general damages (pages 38-42), and special damages (pages 46-48). The Act denies equal protection by invidious discrimination against the poor (pages 43-44). The Act denies equal protection to tortfeasors (pages 49-50).

This Court held the rate reduction section of the Act unconstitutional. If the legislature cannot confiscate business interests, it certainly cannot confiscate human values (page 51).

dominated the focus of public attention and discussion, these constitutional developments are equally relevant to civil litigation. As an Ohio court so aptly and dramatically stated:

Thus, this statute must be declared unconstitutional since it violates the due process guarantees afforded by the state and federal constitutions. \*

-1-

A. DUE PROCESS PRESERVES AND PROTECTS RIGHTS, SYSTEMS, AND PROCESSES  
WHICH ARE FUNDAMENTAL TO THE AMERICAN SCHEME OF JUSTICE.

Attempted scholarly justification for this type of statute has been predicated upon a now discarded and repudiated view of due process. Thus, Professors Keeton and O'Connell, the academic progenitors of this type of statute, sought to justify their plan on the grounds that a holding of unconstitutionality would "put the Supreme Court in the position of condemning the way in which the vast majority of cases are tried in most of the civilized world." See Keeton and O'Connell, Basic Protection for the Traffic Victim, page 496 (1965). Professors Keeton and O'Connell relied upon an earlier standard which has now been overruled by Duncan v. Louisiana, 391 U.S. 145 (1968).

Although Duncan was a criminal case, it has (as indicated above) significant ramifications for civil litigation as well. Writing for the majority of the Court, Mr. Justice White stated:

"Earlier the court can be seen as having asked. . . if a civilized system could be imagined that would not accord the particular protection. . . . The recent cases, on the other hand, have proceeded upon the valid assumption that state criminal processes are not imaginary and theoretical schemes but actual systems bearing virtually every characteristic of the common law system that has been developing contemporaneously in England and in this country. The question thus is whether given this kind of system a particular procedure is fundamental. . . . A criminal procedure which was fair and equitable but used no juries is easy to imagine. . . . Yet no American state has undertaken to construct such a system." 391 U.S. 149-150, n. 14 (emphasis added).

Thus, the new testing ground is broadened to the standard of whether a right, system or process is "fundamental to the American scheme of justice." See Note, 82 Harvard Law Review 148, 151 (1968).

**B. THE RIGHT TO RECOVER FOR PERSONAL INJURY CANNOT BE ABROGATED  
WITHOUT DUE PROCESS OF LAW SINCE IT IS FUNDAMENTAL TO THE  
AMERICAN SCHEME OF JUSTICE.**

It is submitted that the common law system of providing redress for accident victims is fundamental to the American scheme of justice. No other American state has seen fit to construct an alternative system.

The common law system has deep historical roots in Anglo-American jurisprudence. See Petitioner's Brief, pages 11-35. The right of personal security and bodily integrity is a fundamental right. "The right of life and personal liberty are natural rights of man." United States v. Cruikshank, 92 U.S. 542, 553 (1875). The constitutional shelter afforded personal security and bodily integrity by Due Process is graphically illustrated by cases condemning illegal searches and seizures. See e.g., Rochin v. California, 342 U.S. 165 (1952). In addition, this Court, in Mulvey v. Boston, 197 Mass. 178, 183 (1908) described an action of tort for personal injury as a valuable right and that it might be treated as coming "within the protection of some of the broad provisions of the declaration of rights in the Constitution of Massachusetts."

Surely, in a civilized society, there can be no more basic or essential right worthy of judicial protection than the right of the individual to be secure and inviolate in his own person. Can any right be more fundamental? The society which readily extends protection to such matters as speech, press, religion, association, and travel cannot afford to be less responsive to the necessity that personal security and bodily integrity be preserved.

Society cannot afford to do less for its own sake. As history has leaped the arc of the centuries, tort law has been a major guardian of the institutions which are central to our civilization. The moment two men co-existed in the world, the creation of a law of torts became imperative, as an alternative to anarchy--no law (the law of fang, tooth and claw), or tyranny (one-man or group rule). In the modern world, with its menace of incineration, the mission of the law of torts is the stabilization of society by adjusting competing social and individual interests, with a minimum of friction, through rules based on reason and tested by experience.

In light of its central importance, a heavy burden of justification is cast upon those who would seek to alter substantially this essential element of civilization by abrogating valuable and traditional cherished fundamental rights.

C. THE STATUTE UNCONSTITUTIONALLY ABROGATES AND SERIOUSLY INTERFERES  
WITH THE FUNDAMENTAL RIGHT OF PERSONAL SECURITY AND BODILY  
INTEGRITY.

The statute does not effect a mere minor change in this fundamental right. It has a revolutionary thrust and seriously impairs and distorts one's right to personal security and bodily integrity.

Under the statute no one (subject to certain minor or limited exceptions) can recover for pain and mental suffering unless the reasonable and necessary medical expenses incurred are determined to be in excess of \$500.00.

By the common law, it is axiomatic in personal injury cases, plaintiff is entitled to compensation for his entire loss--his loss of earnings or earning capacity, his medical expenses, and his general damages for disability and conscious pain and suffering. See McCormick, Damages 88 (1935); 2 Harper & James, Torts, (1956) §25.10; 4 Restatement of Torts §905, 924; Morris, Liability for Pain and Suffering, 59 Colum. L. Rev. 476 (1959); Olender, Proof and Evaluation of Pain and Suffering in Personal Injury Litigation, 3 Duke L.J. 344 (1962); James, Supplement to Vol. 2, Harper & James, Torts (1968) 141-145. By completely eliminating compensation for general damages, the proponents of no-fault auto compensation plans affront the common-law mandate that dignitary losses of man are compensable.

The statute's deleterious treatment of human losses will impose a serious detriment upon almost every victim. Studies made by the United States Department of Transportation reveal that 78.9 per cent of paid claimants suffered a total economic loss (including wages and matters other than medical expenses) not in excess of \$500.00. Automobile Personal Injury Claims, Vol. 1, Table IV-2, p. 30 (Dept. of Transportation 1970).

"[T]here is abundant authority for the proposition that the state may not altogether abolish a cause of action for redress of injuries without substituting another, adequate remedy in its place." Ruben and Williams, The Constitutionality of Basic Protection, 1 Conn. L. Rev. 44, 46 (1968), citing as authority In re Opinion of the Justices, 211 Mass. 618, 98 N.E. 337 (1912). This conclusion is buttressed by Truax v. Corrigan, 257 U.S. 312 (1921). In Truax, the Supreme Court held that the state could not constitutionally deprive its courts of jurisdiction to enjoin conduct in the course of a labor dispute which the Court characterized as tortious and for which the Court said there was no adequate remedy at law.

Supporters of this type of statute sometimes seek to rely upon Hanfgarn v. Mark, 274 N.Y. 22, 8 N.E. 2d 47 (1937), appeal dismissed, 302 U.S. 641 (1937), and Silver v. Silver, 280 U.S. 117 (1929). Both cases are clearly inapposite and readily distinguishable. Hanfgarn sustained the constitutionality of a statute abolishing actions for alienation of affection, on the grounds that the legislature might have reasonably believed that the cause of action (alienation of affection) produced greater evils than those which it was created to remedy. The fundamental right to recover for pain and suffering can hardly be placed in the same category. In Silver, the Supreme Court sustained the constitutionality of a guest statute which required a showing of aggravated wrongdoing as a prerequisite to recovery. The court did not sanction the abrogation of the right to recover full damages (as this statute does). Rather, it sanctioned a modification (consistent with the fault principle) of the degree of culpability required for recovery. Those who proved aggravated wrongdoing would recover full damages. Furthermore, Silver would appear to be a slender reed to rely upon. As one learned commentator has observed:

"That Silver was something of an embarrassment to the court itself seems apparent. It is a decision which has been afforded an atypical place in history for a Supreme Court pronouncement: That of being studiously avoided. In the past quarter-century, for example, it has been cited by the Supreme Court a grand total of three times: once for the proposition that the states may regulate highway usage; once (in a footnote) with the observation that the case 'in no wise bear[s] on the issue now before us'; and once in a per curiam memorandum of dismissal for want of a federal question, the reason for citing Silver being obscure." Lascher, Hard Laws Make Bad Cases, 9 Santa Clara Lawyer 1, 5 (1968).

Some distinguished jurists have repudiated the rationale relied upon in Silver and have condemned the guest statute as making no "socio economic sense in modern America." See Heath v. Zellmer, 151 N.W. 2d 664, 675 (Wis. 1967); Clark v. Clark, 222 A.2d 205 (N.H. 1966).

The present statute deprives a vast segment of the public of valuable rights to recover for dignitary losses. Does it substitute another, adequate remedy in their place? Two commentators have pointed out that:

"Nothing in Section 5 of the act governing pain and suffering suits, relates to the question of whether or not the plaintiff is entitled to no-fault benefits." Kenney and McCarthy, No-Fault in Massachusetts, 55 Mass. L.Q. 23, 40 (1971).

Thus, many injured persons are now barred from asserting a tort remedy even though they are denied any "no-fault" payment. If the plaintiff is eligible for a workmen's compensation payment, he cannot obtain any "no-fault" benefits, but he may still be precluded from any tort remedy. Hence, large classes of persons (such as employees) may find that their fundamental rights have been confiscated without the substitution of any other remedy.

Have those who may recover the no-fault benefits been given another, adequate remedy for the tort remedy for dignitary human losses? It has been estimated that 87.2 per cent of the civilian population is covered by private health insurance plans providing for hospital care and that 80.7 per cent of the civilian population

is covered by private health insurance plans providing for surgical services. See Congressional Record, March 24, 1971, S.3754.

"It is doubtful whether the circumstances which obtain today in procedures for compensating automobile accident victims offer any such compelling reason to indulge in a fiction to save the Basic Protection Plan. Most Americans today do enjoy some measure of first-party protection against automobile injuries regardless of fault. Well over eighty per cent of our population are covered by health insurance. Families are protected by roughly eight hundred billion dollars worth of life insurance. Social security coverage is extensive, and wage continuation plans are provided by many employers. . . . We do not suggest that the consequences flowing from the mass operation of vehicles upon our highways do not give rise to significant problems. We do suggest, however, that on balance the present magnitude of these problems is not so great that courts would be prepared to engage in myth-making to avoid what seems to be a clear restriction on legislative power." Ruben and Williams, The Constitutionality of Basic Protection, 1 Conn. L. Rev. 44, 54 (1968).

Since most citizens have previously voluntarily acquired these first-party no-fault benefits by other means and from other sources it can hardly be contended that the no-fault benefits are an adequate substitute for the tort remedy which has been abrogated.

It should also be noted that for most citizens, as for the petitioner in this case, the first party no-fault benefits payable under the statute are reduced by the benefits the claimant has been able to procure by his own efforts and from other sources. Thus, the first-party no-fault benefits operate in a parasitic manner by preying upon collateral benefits presently secured to accident victims. In essence, many persons will be deprived of their right to compensation for human losses in exchange for benefits which they themselves have procured by other means and from other sources. This can hardly be an adequate substitute. It is not a substitute but a cruel fiction. Furthermore, to the extent that such benefits are payable,

it will result in the tortfeasor being further immunized from liability for the special damages covered by these benefits. Thus, unconstitutional error is compounded by unconstitutional error. We have a form of "circular constitutionality" in which the abrogation of the tort remedy for general damages is justified by the availability of benefits which the claimant may have procured by his own means and from other sources, and which in turn triggers the abrogation of the tort remedy for special damages.

In addition, the statute does not provide an adequate guarantee that the first party no-fault benefits will be paid as loss accrues. Rather, it merely relegates the injured victim to an action in contract for the benefits which are supposed to be an adequate substitute for the cause of action of which he has been deprived. Unlike the original Keeton-O'Connell plan, no penalties are imposed upon the insurer for late payment of benefits. It is naive to assume that the carrier's conduct will be marked by a spirit of beneficence for injured victims.

In sum, many relatively innocent injured victims will be deprived of their tort remedies for general and special damages and will be required to purchase insurance (which they probably don't need) for their benefit, and the benefit of their passenger, and pedestrians. In addition, these innocent victims may be obliged to sue in order to collect their insurance benefits.

"The suggestion that a purchased private alternative, even when statutorily compelled, is insufficient to meet state constitutional standards of adequacy of remedy is not entirely lacking in force." Ruben and Williams, The Constitutionality of Basic Protection, 1 Conn. L. Rev. 44, 47 (1968).

In this regard, the famed Columbia Plan, which is the forerunner of this type of statute, was cognizant of, and conceded, the point being made here. Under the Columbia Plan, if two vehicles (each driven by its owner), struck one another, each owner's insurer would compensate both the owner of the other vehicle and the

passengers of the vehicle for which it was the insurance carrier. In addition, compensation for injuries to owners and operators of motor vehicles would be excluded unless the injuries were suffered in an accident caused by another motor vehicle. This was done to avoid the constitutional objection to forcing a man to insure against his own injuries. See Columbia University Council for Research in the Social Sciences, Report by the Committee to Study Compensation for Automobile Accidents 139, 140 (1932). If you cannot force a man to insure against his own injuries, a fortiori, you cannot, in addition, deprive him of his right to recover special and general damages.

The first-party no-fault benefits will be no substitute for general and special damages for members of a policyholder's household when the policyholder elects one of the deductibles authorized by the statute. Under Section 4 of the statute, the policyholder may elect a deductible in an amount as large as \$2,000.00. This election is binding upon even adult members of the household, who may not know of the election and who may not have consented thereto. If such an election is made and the adult member of the household is injured, he will not recover personal protection benefits but the tortfeasor who injured him will still remain exempt from tort liability for general and special damages. There is a total failure to provide a substitute remedy and the statute accordingly fails to satisfy due process standards.

The constitutional inadequacy of the alleged "substitute" of first-party no-fault benefits is further highlighted by certain procedures incident to the assertion of claims. Under Section 4 of the statute, in certain cases, the commencement of a tort action results in a suspension of first-party no-fault benefits. In addition, the same section turns upside down some of our fundamental concepts relating to the right to counsel, attorney-client relationships and

privileges, and fair trial. The section provides:

"Noncooperation of an injured person shall be a defense to the insurer in any suit for benefits. . . and failure of an insurer to pay benefits in the event of such noncooperation shall not in any way affect the exemption from tort liability granted herein."

Assume that P, a pedestrian, is injured by a car, owned and driven by X.

P and X are total strangers. P has an action in tort against X. The statute forces P to "cooperate" with his tort adversary's insurer in exchange for the receipt of first-party no-fault benefits (which will probably be reduced or eliminated by benefits which P has himself procured by other means or from other sources). This "exchange" will also result in a loss of a substantial portion of P's remedies for general and special damages. Yet, to be eligible for this "exchange," P must "cooperate" with his adversary. This highhanded and star-chamber procedure, standing by itself, smacks of unconstitutionality.

Thus, the statute unconstitutionally abrogates and seriously interferes with the fundamental right to personal security and bodily integrity.

D. THE STATUTE IS UNCONSTITUTIONAL SINCE ALL OF ITS POSSIBLE PURPOSES  
COULD HAVE BEEN ACHIEVED BY ALTERNATIVES WHICH WERE LESS  
RESTRICTIVE OF FUNDAMENTAL RIGHTS.

Although it is sometimes asserted that a law is valid if it has a "reasonable relation to a proper legislative purpose," see Nebbia v. New York, 291 U.S. 502, 537 (1934), this statute lies in a constitutional zone which requires compliance with a more exacting standard. The governing principle is that this statute violates due process if its purposes can be achieved by one or more narrower alternatives which are less restrictive of fundamental rights. This constitutional concept may be appropriately referred to as "the less-restrictive alternative principle." See Struve, The Less-Restrictive Alternative Principle and Economic Due Process, 80 Harvard Law Review 1463 (1967). This principle requires the legislature to employ "the narrowest workable means of accomplishing an end." Wormuth and Mirkin, The Doctrine of the Reasonable Alternative, 9 Utah Law Review 254, 257 (1964).

This Court has adopted the doctrine. See Struve, The Less-Restrictive Alternative Principle and Economic Due Process, 80 Harv.L. Rev. 1463, 1464 (1967), note 7, citing Opinion of the Justices, 322 Mass. 755, 79 N.E. 2d 883 (1948). This Court recently reaffirmed its adherence to the doctrine in Commonwealth v. Leis, 355 Mass. 189 (1969). In that case, the Court proceeded to shape the contours of the doctrine and indicated that it was applicable to three types of statutes. It is applicable and governs regulations affecting interstate commerce, constitutionally sheltered activity, and economic activity. Commonwealth v. Leis, 355 Mass. 189, 195 (1969). It is obvious that this statute falls within all of these areas. It is an important economic regulation affecting the operations and conduct

of the entire automobile insurance industry. In addition, the statute affects interstate commerce. This is evidenced by the applicability of personal injury protection benefits to out of state accidents. It is dramatically illustrated by Senate Bill No. 4339 (the "Uniform Motor Vehicle Insurance Act"), which was introduced in the 91st Congress, 2d Session, the Declaration of Purposes of which refers to "the great number of motor vehicles operated within the channels of interstate commerce upon the public streets, roads and highways of the States." Finally, the fundamental right to personal security and bodily integrity should receive the same constitutional protection as travel, religion, association, and speech and should be deemed to lie within the area of constitutionally protected activity. See Aptheker v. Secretary of State, 378 U.S. 500 (1964); Sherbert v. Verner, 374 U.S. 398 (1936); Shelton v. Tucker, 364 U.S. 479 (1960); Talley v. California, 362 U.S. 60 (1960).

Before one can determine whether there were less restrictive alternatives, one must ascertain the purpose or end to be achieved. The Court is handicapped by the lack of any written legislative history, but we are all familiar with the charges and claims made by proponents of this act:

(1) Some injured persons receive inadequate or no compensation; (2) There is congestion and delay in the courts; (3) There is delay in getting payments to the injured person; (4) Some victims are overcompensated, while others are undercompensated; (5) Fault determinations are costly and unreliable; (6) The cost of insurance is too high; (7) The present system is marred by "temptations to dishonesty." See for example, Keeton & O'Connell, Basic Protection for the Traffic Victim, 1-5 (1965).

At this juncture, we are not concerned about the validity of these criticisms. We shall, for purposes of argument, assume that each one of them is valid and that it might have been the evil sought to be dealt with by the statute. Furthermore, we are also assuming (for purposes of argument) that the statute bears some reasonable relationship to the evil to be treated. (In the next section, we shall demonstrate that no such relationship exists.) Rather, we are concerned with whether the ends could have been achieved by less restrictive and onerous alternatives.

We submit each one of these alleged problems could have been treated by less restrictive or onerous alternatives. We shall examine these charges seriatim.

(1) Some injured persons receive inadequate or no compensation.

The statute does not really ameliorate this problem, but rather aggravates it. It denies compensation for dignitary losses to 78.9 per cent of the relatively innocent injured victims. In addition, the overwhelming majority are unlikely to receive first-party benefits and special damages because they have procured benefits from other sources and from other means. The legislature should have considered and adopted alternatives which did not abrogate fundamental rights. Thus, it should have considered and adopted alternative measures such as the abrogation of immunities, higher wrongful death limits, higher insurance limits, more extensive uninsured motorist coverage, and modes of regulating and preventing insurance company insolvencies. In addition, statutory temporary disability insurance (programs generally designed to provide wage loss payments for those disabled as a result of injury not arising out of the employment) would serve to alleviate the problem of those who receive no compensation. See New

York Workmen's Compensation Law, Article 9; New Jersey Statutes Annotated, Title 43, Subtitle 9; West's Annotated California Codes, Unemployment Insurance, §2601.

(2) There is congestion and delay in the courts.

The problem of congestion could have been more reasonably alleviated by an infinite variety of more effective methods (without listing all of them) such as increasing the number of judges as the population increases, unified and centralized court management, the updating of facilities and administrative procedures (including the maintenance of adequate judicial statistics and the use of court administrators), arbitration, broadened discovery procedures, offers of judgment, juries of less than 12, and non-unanimous jury verdicts. With respect to the successful use of arbitration, see Ryan, Arbitration Cuts Philadelphia Backlog, 10 For the Defense 42 (June 1969). It is interesting to note that a recently completed poll of New York Trial Judges showed that 99 out of 100 opposed no-fault legislation, while 80 out of 100 favored arbitration of small claims. The New York Law Journal, April 26, 1971, p. 1.

(3) There is delay in getting payments to the injured person.

The statute makes no real effort to eliminate delay. No penalties are imposed upon the insurer for tardiness. Indeed, the statute has provisions which excuse the insurer from making any payments while a tort action is pending. Aside from the fact that the statute will not effectively curb delays in payments (It will cut them off completely!), there were more effective alternatives which should have been considered and adopted.

For example, many insurers now engage in advance payment programs (payment in advance of a determination of legal liability) to get needed moneys to claimants

without delay. See Graham, Advance Payment in Personal Injury Claims, 3 Forum 208 (1968). It is now estimated that in other states hundreds of thousands of claimants annually are being offered the benefits of this new technique, with one company reporting that it was paying over \$1,300,000.00 a month in advance payments. See Lemmon, Ingredients for Reform, 6 Trial 56, 58 (Oct/Nov 1970). Although it is a relatively new procedure, the study of the Department of Transportation reveals that 19% of those eligible received some form of advanced payment. See Automobile Personal Injury Claims, Vol. 1, p. 120 (Department of Transportation 1970). Although Massachusetts has a statute dealing with advance payments, see Mass. General Laws, C. 231, Section 140B, 140C, its use has not been extensive since it does not contain safeguards for the protection of the victim. A proposal, such as House No. 2359 (1970), if enacted, would cure this problem and result in a wider use of the procedure in this state. This is the course of action which should have been followed rather than this statute which abrogates fundamental rights. Victims would have received more (there would have been no reduction for collateral benefits and no threshold of \$500.00 in medical expenses to overcome) and at a faster rate.

(4) Some victims are overcompensated, while others are undercompensated.

Proponents claim some victims are overcompensated because insurance companies, in an effort to avoid the burdens of litigation, tend to make generous settlements of "small claims." [This criticism erroneously assumes that the "small claim" is less deserving of constitutional protection.]

Yet, without sacrificing any fundamental rights, the problem could have been more reasonably alleviated by the adoption of a compulsory arbitration procedure for "small" claims. Furthermore, as will be demonstrated subsequently, if any

problems exist here, they are attributable to property damage claims rather than bodily injury claims.

As far as the undercompensated victim is concerned, the abrogation of the right to recover for human losses obviously does not aid him. The legislature should have considered and adopted statutes calling for increased limits of liability, the removal of immunities and limits on wrongful death recoveries, and the retention of collateral source benefits along with the tort settlement. And if procedures were adopted which were aimed at relieving delay in the courts, the undercompensated claimant would not be under any alleged pressure, by reason of the prospect of a long delay pending trial, to accept an inadequate settlement. See Report of the American Bar Association, Special Committee on Automobile Accident Reparations, 103-105 (1969).

(5) Fault determinations are costly and unreliable.

If problems exist with respect to the processes of proof, these could be more effectively and reasonably resolved by improving evidentiary rules and techniques. Thus, the effort of the legislature should have been channelled along the lines of the Judicial Conference of the United States which is now considering new Proposed Uniform Rules of Evidence.

It should be noted that it is somewhat of a misnomer to describe this statute as a no-fault law. Under Section 4 of the statute, an insurer who pays personal protection benefits is subrogated to the rights of the party to whom it has paid benefits and it is to be reimbursed for such benefits by the tortfeasor on the basis of fault. Fault is to be determined by the insurers (by agreement or arbitration). Thus, although the courts allegedly are incapable of allocating losses on the basis of fault, insurers have the capacity to do so!

If the legislature wished to dispose of fault, it could have done so by establishing absolute liability, while retaining the right to recover full damages. That system is applied in most of continental Europe. See Department of Transportation, *Comparative Studies in Automobile Accident Compensation* (1970).

(6) The cost of insurance is too high.

The level of the present cost of insurance is due in large part to property damage. Reliable estimates are that 55% - 70% of the automobile insurance premium dollar goes to pay for property damage coverages. See Ghiardi & Kirchner, Automobile Insurance: The Rockefeller-Stewart Plan, 37 Ins. Counsel J. 324, 326 (1970). In addition, more than ten times as many people incur damage to their cars as incur personal injuries. See Lemmon, Ingredients for Reform, 6 Trial 56, 58 (Oct/Nov 1970).

Rather than abrogating the right to recover for many human losses, the legislature should have considered and adopted means of controlling the property damage problem, such as making property damage coverages compulsory. The statute requires mandatory offering of such coverages, but it does not compel the purchase of such coverages. This was the more reasonable and effective alternative for reducing the cost of personal injury insurance.

Furthermore, the legislature should have considered and adopted the alternative of eliminating subrogation of property claims.

"Subrogation ends up with the companies passing the same money back and forth, after jamming the courts all the more and running up litigation costs." Pitkin, The Dilemmas of Auto Insurance, *The Legion Magazine*, p. 8, 48 (April 1969).

It is axiomatic that "fewer accidents would mean less damage, fewer claims and fewer litigated cases," Note, 46 Notre Dame Lawyer 542, 557 (Spring 1971). The really reliable method of reducing premiums is the enactment of a stringent safety program. Vehicles could be made safer and more durable. In fact, other states have enacted so-called Bumper-Protection laws which compel the manufacture of durable vehicles. The drunk driver could be removed from the road. See Pa. Action Comm. For Highway Safety, Some Proposals for Saving Life and Property and Reducing the Cost of Automobile Insurance, 1970 Ins. L.J. 692. In addition, the use of safety equipment could have been required by the legislature. These are just some of the reasonable, effective alternatives which would have reduced the cost of insurance.

(7) The present system is marred by "temptations to dishonesty."

We will indicate in the next section that the remedy adopted by the legislature is a greater inducement to fraud. If the legislature wished to curb fraudulent claims, it should have strengthened the Fraudulent Claims Bureau and increased the penalties for the assertions of fraudulent claims.

As the Supreme Court of the United States has recently declared with respect to welfare frauds:

"Similarly, there is no need for a State to use the one-year waiting period as a safeguard against fraudulent receipt of benefits; for less drastic means are available, and are employed, to minimize that hazard." Shapiro v. Thompson, 394 U.S. 618, 637 (1969) (emphasis added).

It is submitted that the legislature should have pursued the above mentioned reasonable and effective alternatives rather than arbitrarily abrogating fundamental rights. As one article recently concluded:

"The idea of compelling someone to give up his right to a jury trial and to certain common law remedies is not acceptable. It is possible to bring about many needed reforms in automobile insurance without denying basic rights. . . . No rush should be made toward unproven plans which deny basic rights." Friedman, No-Fault Insurance -- A Premature Destruction of the Tort Liability Reparations System in Automobile Accident Cases, 46 Notre Dame Lawyer, 542, 561-563 (Spring 1971).

E. ASSUMING ARGUENDO, THAT THE LEGISLATURE DID NOT HAVE TO ADOPT A LESS RESTRICTIVE ALTERNATIVE, THE STATUTE IS STILL UNCONSTITUTIONAL SINCE IT BEARS NO REASONABLE RELATIONSHIP TO A PROPER LEGISLATIVE PURPOSE.

This statute is unconstitutional even under the standard that the legislation need only have a "reasonable relation to a proper legislative purpose." This can be demonstrated by an evaluation of the relationship of the statute to its possible purposes. In this regard, we shall once again treat the seven alleged evils highlighted in the previous discussion as the shortcomings sought to be eliminated by the statute and shall treat them *seriatim*.

(1) Some injured persons receive inadequate or no compensation.

The elimination of the right of the overwhelming majority of the populace to recover for human losses and special damages will not ameliorate this problem. Instead, it will obviously and patently aggravate it. It is not a proper replication to suggest that no-fault benefits are afforded by the statute. Their availability certainly does not remove the constitutional infirmity of abrogating a fundamental right with respect to those who cannot recover no-fault benefits (because they are ineligible) and with respect to the overwhelming majority of the populace whose no-fault benefits will be reduced by benefits from collateral sources. Thus, there is no reasonable relationship between the statute and the alleged evil sought to be eliminated.

Experience in the first three months since the act became effective, by comparison with the same period of 1970, indicates that only one-half as many victims received any payment, the average payment was reduced 36%, and total payments were down 39%. See New York Times, April 24, 1971.

(2) There is congestion and delay in the courts.

The lack of a rational relationship between the statute and the purpose of alleviating court congestion is substantiated by the information contained in a letter from the Chief Justice (in his previous capacity as Chief Justice of the Superior Court) to the Governor of the Commonwealth. See 6 Trial 49 (Oct/Nov 1970). Because it so thoroughly and cogently documents the point, we set it out in full in Appendix B.

(3) There is delay in getting payments to the injured person.

This statute does not curb delay in making payments to victims. It is designed to and does eliminate payments for dignitary losses and special damages for an overwhelming majority of the populace.

Furthermore, the first-party no-fault benefits (to the extent that one receives them) cannot, of necessity, be paid without delay. There is the built-in delay of the injured person waiting for the insurer to determine if collateral benefits are available. In addition, there is no penalty in the statute to compel the insurer to make such payments promptly. Our experience reveals that when the chips are down it is quite possible that the "friendly" carrier might show its insured its back--in the Ambrose Bierce sense of the term, "That part of your friend which it is your privilege to contemplate in your adversity." If the carrier fails to pay, the victim is relegated to a contract action. Any relationship between the statute and the above purpose is a myth.

(4) Some victims are overcompensated, while others are undercompensated.

As indicated above, the statute is designed to and does eliminate payments for dignitary losses and special damages for an overwhelming majority of the

populace. Hence, it does not reasonably relate to the purpose of alleviating the plight of the undercompensated.

Furthermore, there is no rational relationship between incurring \$500.00 medical expenses and the fair allocation of losses. It is the height of arbitrary and capricious conjecture to assume a valid relationship between medical expenses and dignitary losses. It is a demonstrable fallacy to suppose that there is a fixed relationship between the cost of medical expenses and attendant pain and suffering.

In cooperation with the Department of Transportation Automobile Insurance and Compensation Study, the Closed Claims Sub-committee of the Insurance Advisory Committee (including the 10 largest automobile volume company groups in the country) conducted a survey. The Survey concluded that there is no automatic correlation between "the amount of economic loss and the consequent indirect or psychic loss." It found that:

"The particular injury involved, the occupation of the injured, the economic stratum in which he exists, may all have a bearing by varying degree on the indirect damage segment of the loss. Thresholds of pain and tolerance thereto differ in individuals just as does the psychic impact and residual of injury. These relationships must be valued in each particular case and the absence or presence of indirect elements of damage are matters of widely varying degree." Automobile Personal Injury Claims, Vol. 1, p. 113 (Dept. of Transportation 1970) (emphasis added).

The Chart of Actual Cases in Appendix A indicates that judges and juries (who best reflect the community's notions of justice) believe that there is no rational correlation between medical expenses and human losses.

It is not constitutionally permissible to sanction this statute by invoking the shibboleths that it merely abrogates "small claims" or "nuisance" claims. As this Court has so aptly concluded:

"No discussion is required to show that it is beyond the power of the Legislature, under constitutions which guard the individual against being deprived of property without due process of law, to declare without any process at all that a well recognized kind of property shall no longer be property. 'Lawful property cannot be confiscated' under the guise of a statute. Durquin v. Minot, 203 Mass. 26, 28 (1909). When legislative attempts to compel the deprivation of certain comparatively small sums of money without due process of law invariably fail, see for example, Northern Pacific Railway v. North Dakota, 236 U.S. 585; Great Northern Railway v. Minnesota, 238 U.S. 340; Chicago, Milwaukee & St. Paul Railroad v. Wisconsin, 238 U.S. 491, Louisville & Nashville Railroad v. Central Stock Yards Co., 212 U.S. 132, it is manifest that something recognized as property by the law of the land cannot be extinguished utterly." Bogni v. Perotti, 224 Mass. 152, 155-156 (1916) (emphasis added).

(5) Fault determinations are costly and unreliable.

This legislation is really not a "no-fault" statute. Rather, it is a reduced or no-payments statute. To the extent that common law remedies are preserved, they are governed by the fault principle. To the extent that so-called first-party no-fault benefits are paid to an injured victim, the insurance carrier making such payments is subrogated to the rights of the victim and it may sue the tortfeasor and will be reimbursed by the tortfeasor only if fault can be shown. This process of subrogation, based upon the fault principle, is to be effectuated between insurers (by agreement or arbitration). Hence, the statute really does not purport to come to grips with any alleged defects in the fault principle. To the contrary, it rather smugly assumes that insurance carriers can be relied upon to allocate losses adequately upon the basis of the fault principle. Hence, it is constitutionally difficult to rationalize the abrogation of a fundamental right upon the basis of a discontent with the fault principle.

The retention of fault is based upon the verities of experience. A recent study conducted by an insurance company demonstrated that in over 90% of all automobile accidents fault could be easily assessed--usually from only the facts contained in the initial report of the accident. Marryott, Testing the Criticisms of the Fault Concept, 35 Ins. Counsel J. 112 (1968). Thus, empirical data reveals that the abrogation of the fault principle (if such had occurred) would not have been justified.

In addition, under the statute there will, of necessity, be a multiplication of the mechanisms for processing claims. An injured victim will have a claim against a third party tortfeasor and his own insurance company. Both insurance companies will have to investigate, administer and process claims. Thus, it is irrational to suggest that this statute will reduce costs. Rather, it will, of necessity, increase them.

(6) The cost of insurance is too high.

This statute is inherently and patently incapable of reducing the costs of insurance. To the contrary, it is designed to and does increase the costs of insurance in an arbitrary and capricious manner. This is dramatically illustrated by the facts of this case.

It was stipulated in the Statement of Agreed Facts that, prior to the enactment of the statute, Pinnick's compensation recoverable for the injuries was \$1,565.00. It was further agreed that such benefits would have been obtained (using his 1970 premium as the basis for computation) as a result of Pinnick having paid a premium of \$49.00.

On the other hand, under any conceivable interpretation of the facts of the case and of the statute, Pinnick will not receive more than \$300.28 in personal injury protection benefits. Despite his severe low back sprain with radiation of pain into the lower right extremity, he recovers nothing for this human loss since he did not incur medical expenses in excess of \$500.00. Because he did not actually lose any wages at his post office job, he is not compensated for this aspect of his impaired earning capacity. At his second job, at which he was paid \$96.25 per week, he lost 12 days of wages. Since the statute limits wage loss recovery to 75% of the wages lost, his maximum recovery for this item of damages is \$185.28 (even if we assume only a 5-day work week; it would be less if he worked 6 days a week). His recovery would be limited to the sum of his lost wages (\$185.28) and medical expenses (maximum amount of \$115.00). Thus, as a result of having paid a premium of \$41.70, Pinnick receives benefits of \$300.28.

In order to understand the true costs of Pinnick's insurance, these figures must be quantified in terms of benefit-cost relationships. Under the common law system, Pinnick paid \$49.00 and received \$1,565.00 in benefits. Thus, the common law benefit-cost ratio is  $\$1,565.00 / \$49.00$  or 31.9. This is to be sharply contrasted with Pinnick's benefit-cost ratio under the statute. Under the statute, Pinnick pays \$41.70 and receives only \$300.28 in benefits. Thus, the benefit-cost relationship under the statute is  $\$300.28 / \$41.70$  or 7.4. Thus, by paying 2¢ less (in a nominal and illusory sense) per day, we drop from \$31.9 of benefits per dollar of cost (under the common law) to \$7.4 of benefits per dollar of cost.

In other words, after the statutory change, true insurance costs have risen in an arbitrary and capricious manner. As a result of this statutory change, a dollar of benefit expectations costs us 3.3 times more than it did before the change. Thus, an expert on insurance has aptly noted with respect to the change:

"Our real costs have risen greatly despite a nominal reduction in price." Brainard, Prices and Politics, 6 Trial 24, 45 (Oct/Nov 1970).

Pinnick is not atypical. His plight is representative of the overwhelming majority of our citizens. The statute arbitrarily and capriciously penalizes the deserving, responsible citizens who have by their thrift, efforts, and industry secured collateral benefits. Indeed, it penalizes all relatively innocent injured victims. The only ones who might conceivably benefit are the reckless and irresponsible. Thus, the over-all real costs of insurance have been increased in an arbitrary and capricious manner.

Furthermore, even when viewed from the narrow focus of "price" of premiums, as distinguished from the realities of true costs, the statutory scheme has proven itself incapable of reducing the "price" of premiums. According to statistics compiled by the Commissioner of Insurance, the over-all premiums for automobile insurance coverages paid by the average driver in Massachusetts increased during the current year.

This Court previously held that the rate reduction provisions (Section 6) of the statute are unconstitutional. See Aetna Cas. & Sur. Co. v. Comm'r of Ins., 1970 Mass. Adv. Sh. 1411. Section 3 of Chapter 744, as enacted on August 23, 1970, provided for a complete reinstatement of the common law system "if any of the provisions of chapter 670 of the acts of 1970 providing for

the exemption of persons from tort liability or a restriction on the right to recover damages for pain and suffering are held to be unconstitutional." Despite the presence of a severability clause in the statute, this section mandates a decree reinstating the common law system in toto if any of the key and integral parts of the statute are held unconstitutional. The rate reduction section is inextricably tied (both in its words and in the expectations of the public and the legislature) to the provisions pertaining to the exemption from tort liability. Section 6 specifically provides that it was inserted ". . . for the purposes of putting into effect the provisions of the General Laws providing for personal injury protection." (Emphasis to statutory language added). The exemption from tort liability is an integral part of the provisions pertaining to personal injury protection. It is the alleged quid pro quo for personal injury protection benefits. Furthermore, there is no exemption from tort liability unless both the tortfeasor and the victim are covered by personal injury protection benefits. Personal injury protection benefits and the exemption from tort liability are legislative Siamese twins. Hence, we submit that since provisions pertaining to the exemption have been held unconstitutional, the common law system of providing redress must be restored in toto.

(7) The present system is marred by "temptations to dishonesty."

If fraud exists at common law, it is a fortiori inherent (to an even larger degree) in this statute. Under the statute, first-party no-fault benefits are payable for injuries received while alighting from and entering the vehicle. It is not necessary to show that the car was in motion. How many slip and falls will

become automobile claims? Furthermore, unlike the prior compulsory coverage, the accident need not occur on the ways of the Commonwealth or places to which the public has a right of access. See Kenney and McCarthy, No-Fault in Massachusetts, 55 Mass. L.Q. 23, 25 (1971). How many accidents will be staged in the secrecy and privacy of one's home?

The necessity of crossing the \$500.00 medical expenses threshold to recover for pain and suffering is an inducement to fraud in the ballooning of medical bills. In addition, there is a built-in statutory temptation to conceal collateral benefits.

We submit that there is no rational nexus between this statute and the elimination of fraud.

The concept of due process is measured by the "community sense of 'decency and fairness' that has been woven by common experience into the fabric of acceptable conduct." Breithaupt v. Abram, 352 U.S. 432, 436 (1957). In 1968, the State Farm Insurance Company submitted a questionnaire to its more than 11 million policyholders to test public preference as between fault and non-fault insurance. Of the 3,090,315 tabulated responses, 94% favored the retention of the fault system. The New York Times, Dec. 15, 1969, p. 41. This finding has been substantiated by other studies as well. See Spangenberg, The Public Attitude, 6 Trial 34 (Oct/Nov 1970). There is an old saying, "Walk from the people and you walk into the night." This statute arbitrarily and capriciously abrogates fundamental rights cherished by the community. It has no reasonable relation to a community valued purpose.

F. THE STATUTE CANNOT BE SUSTAINED BY DRAWING AN ANALOGY TO  
WORKMEN'S COMPENSATION.

Some supporters of this legislation have attempted to find constitutional comfort in cases upholding state workmen's compensation laws. There are a number of solid reasons why the statute cannot be sustained by drawing such an analogy. First, as other briefs filed in this case have cogently pointed out, the abrogation of common law remedies is elective under workmen's compensation. The employee has the choice, when he enters the employment relationship, of retaining his common law rights. Under this statute, the injured victim is afforded no such election or choice. The decisions that workmen's compensation laws were not denials of due process rested on the idea that both employers and employees received advantages under the new system which could be balanced against the common law rights which they lost. See New York Central R. Co. v. White, 243 U.S. 188, 201 (1917). The legislature cannot abolish a cause of action for redress of injuries without substituting another, adequate remedy in its place. We have demonstrated in Part C above that the legislature did not provide an adequate substitute for the fundamental rights it had abrogated.

Two outstanding tort and constitutional Law scholars, Professors Kalven and Blum of the University of Chicago Law School, have succinctly explained the absence of any meaningful analogy. Rather than paraphrasing their discussion, we report their dispositive analysis:

"We will not do more than note that there has been a curious instance of cultural lag in the conventional arguments from workmen's compensation. Workmen's compensation is being looked to as the model of a brilliant social reform at a time when, for those familiar with the field, the bloom is off the rose and there is sharp criticism of the meagerness and rigidity

of award schedules, and of the costs, delays, irregularities and suspected corruption in the operation of the system."

"Nor will we do more than mention several differences, which some observers have urged as critical, between the industrial accident situation and the auto accident situation. It is said that while the industrial accident is relatively fixed and easy to investigate, the auto accident is more transient and difficult to investigate. The result is that there are likely to be great differences in the opportunities for policing fraudulent claims in the two areas. It is also said that damages are more amenable to scheduling in the one case than in the other, both because the range and variety of physical injuries is more restricted in the industrial accident, and because the injured personnel are drawn from a fairly homogeneous economic group. These are acute observations, and they do point up specific difficulties which would be encountered in administering a compensation plan, but they do not cut deep enough to put to rest Jeremiah Smith's challenge of fundamental inconsistency."

"There are three residual differences which lead us to deny the analogy to workmen's compensation. First, there is a great difference between the common law system for industrial accidents which workmen's compensation was created to replace and the common law system for auto accidents which exists today. Under the law of fifty years ago, we are told, the ability of the injured employee to recover was greatly circumscribed by the well-known trilogy of employer defenses--assumption of risk, contributory negligence, and the fellow servant rule. The old law has looked to some like a conspiracy to throw the losses of industrial accidents onto employees as a class at a time when they were conspicuously less well off than their employers. There is no comparable harshness in the law which confronts the auto accident claimant today. In the same vein, the whole 'welfare' support for workmen's compensation is considerably diluted today in the auto accident area. First party insurance and social legislation have come on the scene and have greatly reduced the likelihood that the auto accident victim and his family will bear the full brunt of the accident."

"A second difference is that the enterprise situation made possible a popular myth as to how the cost of workmen's compensation was to be borne. The widespread image was that by placing the cost of workmen's compensation on employers the cost would be passed on to consumers of their products through operation of market forces. The result was thought to be that not only social justice but economic justice would be accomplished; and this view of the matter was crystallized in the slogan that the cost of products should reflect the blood of workmen. Although there are good reasons today for doubting whether consumers do bear the cost of workmen's compensation, for our immediate purposes it is enough that there is no one

in the auto situation who occupies a role which the employer was popularly thought to play in the industrial accident situation--no one, that is, who could be regarded as being in a position to pass on the costs to consumers via the market. "

"A third difference challenges the view that workmen's compensation offers a competing doctrine of tort liability. There is no doubt that this is the traditional view; workmen's compensation was enacted to repeal and replace common law tort rules, and it was challenged and ratified in court on that premise. We wish to suggest here a considerably different view of the history and rationale. In retrospect, we are impressed that workmen's compensation can best be understood as a kind of 'fringe benefit' incorporated by law into the basic employment contract. The law in effect compelled the employer to provide, as a term of employment, an industrial accident policy for his employees."

"Several strands of thought support this perspective. In his highly regarded casebook on Agency, Roscoe Steffen groups materials so as to place workmen's compensation as part of the employment relationship. He suggests that the legal history of personal injuries to employees could easily have been different--that courts could readily have handled the whole problem as an aspect of the employee's indemnity action against the employer for losses incurred in the course of an agency relationship. There is a contemporary analogue in the tendency today to use workmen's compensation as a base, and through collective bargaining to expand the benefits to cover unemployment, sickness and accidents off work. What we wish to emphasize is that this continuum from statutory benefits to collective bargaining agreements can be read backwards, so as to view the whole as part of the employer-employee contract. The distinctive quality is that each of these forms of coverage is tied in to the employment nexus. On this view the issue to which workmen's compensation is addressed is primarily that of determining the terms and conditions of employment."

"In stressing this somewhat novel rationale for workmen's compensation, our chief purpose has been to point up a significant difference between the industrial accident and the auto accident. Unlike workmen's compensation, there is no contractual nexus on which auto compensation plans can build. "

"Thus we conclude that the reason society has for so long tolerated different legal principles for industrial accidents and for the tort field generally is that, Jeremiah Smith to the contrary, the two areas are essentially different." Blum and Kalven, Public Law Perspectives on a Private Law Problem, 25-27 (1965).

The third distinction noted by Professors Blum and Kalven has been explicitly endorsed and followed by the United States Supreme Court. In Truax v. Corrigan, 257 U.S. 312, 329 (1921), the Supreme Court stated:

"These cases (speaking of the workmen's compensation cases), all of them, relate to the liabilities of employers to employees growing out of the relation of employment for injuries received in the course of employment. They concern legislation as to the incidents of that relation. . . . The broad distinction between one's right to protection against a direct injury to one's fundamental property right by another who has no special relation to him, and one's liability to another with whom he establishes a voluntary relationship. . . is manifest upon its statement."

II. THE STATUTE VIOLATES THE EQUAL PROTECTION GUARANTY OF THE  
MASSACHUSETTS AND FEDERAL CONSTITUTIONS.

Articles VI and VII of the Massachusetts Constitution provide, in part,  
as follows:

"Article VI. No man, nor corporation, or association of men, have any other title to obtain advantages, or particular and exclusive privileges, distinct from those of the community, than what arises from the consideration of services rendered to the public. . . ."

"Article VII. Government is instituted for the common good; for the protection, safety, prosperity and happiness of the people; and not for the profit, honor or private interest of any one man, family, or class of men. . . ."

Article XIV, Section 1 of the United States Constitution provides in part:

". . . nor shall any state. . . deny to any person within its jurisdiction the equal protection of the laws."

In substance, both of these Constitutional restrictions proscribe legislation which classifies citizens of Massachusetts by characteristics that are arbitrary or capricious, by characteristics that have no reasonable rational relationship to the legislative goal, and by characteristics that are manifestly beyond the control of the regulated persons.

Within the last decade, the "equal protection" guaranty has been given two additional dimensions. First, greater judicial supervision is exercised and less legislative latitude is permitted where the statute affects a "fundamental right." If a "fundamental right" is involved, the courts seem to demand an embracing classification which avoids any exclusion of persons whose inclusion would have been compatible with the legislative goal.

"The new concepts of equal protection hardly fit within the traditional method. The decisions appear to rest upon two largely subjective judgments, perhaps coupled with a sense of how fast a change the community desires. One element is the relative invidiousness of the particular differentiation, such as between men of different race, farmer and city dweller, rich and poor, literate and illiterate, or men and women. The second element is the relative importance of the subject with respect to which equality is sought, such as the vote, the defense of a criminal prosecution, or civil litigation." Cox, The Supreme Court 1965 Term--Forward, 80 Harv.L.Rev. 91, 95 (1966) (emphasis added).

The Supreme Court of the United States has recently stated that legislation cannot infringe upon a fundamental right "unless shown to be necessary to promote a compelling governmental interest." Shapiro v. Thompson, 394 U. S. 618, 634 (1969). If a state cannot penalize the right to travel (the right recognized in Shapiro), it certainly cannot arbitrarily abrogate the fundamental right to personal security and bodily integrity.

The high degree of constitutional protection afforded the tort remedy for personal injuries was dramatically highlighted by two recent decisions dealing with the rights of illegitimate children. In Levy v. Louisiana, 391 U.S. 68 (1968), the Court held that Louisiana could not constitutionally bar an illegitimate child from recovering for the wrongful death of its mother, while permitting such recovery by a legitimate child. Last month, the Court held in Labine v. Vincent, 39 L.W. 4344 (1971) that the same equal protection considerations did not prevent Louisiana from barring an illegitimate child from intestate succession, while affording such rights to a legitimate child. In so doing, the majority opinion distinguished the earlier Levy case on the ground that it involved a tort remedy, which the Court obviously considered more fundamental than a right of intestate succession:

"The cause of action alleged in Levy was in tort. It was undisputed that Louisiana had created a statutory tort and had provided for the survival of the deceased's cause of action, so that a large class of persons injured by the tort could recover damages in compensation for their injury. Under those circumstances the Court held that the State could not totally exclude from the class of potential plaintiffs illegitimate children who were unquestionably injured by the tort that took their mother's life. Levy did not say and cannot fairly be read to say that a State can never treat an illegitimate child differently from legitimate offspring." (id. at 4345).

The second dimension added to the "equal protection" guaranty is the concept of "inherently unreasonable classifications." Certain characteristics, which are beyond the control of the regulated individual, are necessarily arbitrary, capricious, and unreasonable--race, religion, personal status, family, sex, indigence. See Schwartz, A Commentary on the Constitution of the United States, Vol. 2, §§474-77 (1968). Classification which results in part from the wealth or poverty of the individual has been under particularly vigorous attack. E.g., Tate v. Short, 39 L.W. 4301 (1971) (outlaws imprisonment of traffic offenders who cannot pay assessed fines); City of Phoenix v. Kolodziejski, 399 U.S. 204 (1970) (forbids restriction of electorate for general obligation bonds to property owners); Boddie v. Connecticut, 39 L.W. 4294 (1971) (invalidates statute requiring payment of court fees and expenses as absolute condition for filing divorce action).

Some more cautious commentators have described classes formed by these characteristics as "suspect classifications," which require extraordinary justification for use by a legislature in discriminating between one class and another. See Note, "Developments in the Law of Equal Protection," 82 Harv. L. Rev. 1065, 1099, 1101 (1969). However, whichever terminology is utilized, there can be no doubt that certain classifications are particularly onerous and invidious.

An examination of this statute demonstrates that (a) it seeks to abrogate the fundamental right to full compensation for injuries tortiously inflicted by another (see *supra*, pp. 3-11), (b) by a classification that is unreasonable, arbitrary, and capricious, and which (c) strikes hardest at those in lower economic circumstances--an inherently unreasonable classification. Thus, it constitutes an invidious discrimination among the class of tort victims.

Further examination demonstrates that this statute also violates the equal protection guaranty for the class of motorist-defendants by granting immunity to some, while denying it to others--for reasons totally unrelated to the nature of the tortious conduct or the severity of injuries sustained by the victim.

A. THE ACT DENIES "EQUAL PROTECTION" TO TORT VICTIMS SUFFERING  
GENERAL DAMAGES.

Section 5 of Chapter 670 (Section 6D of Chapter 231 of the General Laws) provides that an automobile tort victim cannot recover general damages unless his injuries involve one of the following unrelated categories: (1) death, (2) permanent serious disfigurement, (3) deafness or blindness, (4) dismemberment, (5) any fracture, or (6) medical expenses exceeding \$500.00. Although there is no clear legislative history, it would certainly appear that the legislature was attempting to separate "more serious" injuries from "less serious" injuries, or to separate injuries causing greater "disability" from those causing little or no "disability." However, the legislature did not use such terms, synonyms for those terms, or equivalent phrases.

Instead, the legislature clumsily grasped for some individual standards that might conceivably accompany more serious or more disabling injuries. Indeed, the very multiplicity of standards attempted by the Act demonstrates its inadequacy, since it seems relatively obvious that many serious injury cases with resulting serious disability will fall through the large holes left in this clumsy sieve of classification. Many tort victims suffering relatively serious injuries with relatively serious disability will be barred from any compensation for general damages, while a significant number of tort victims with relatively trivial injuries and relatively trivial disability will be entitled to full general damages.

This court has viewed numerous cases of serious injury with resulting serious disability that did not meet any of the classification characteristics specified

in this Act. Those persons would not be allowed compensation for disability, physical and mental anguish, loss of ability to enjoy life, or any other general damages. By contrast, every insurer could cite a multitude of "small" claims, involving one or more of the characteristics specified in the Act, which would authorize an award of full general damages. See the Table of Actual Cases in Appendix A, *infra* p. 52.

Under the Act, the required threshold of \$500.00 medical expenses, subjects the victim to the unconstitutional vagaries of a doctor's whim.

Consider the victim whose doctor directs conservative, non-surgical treatment for a herniated intervertebral disc in the back, or a torn meniscus of the knee, or major psychiatric disturbance from a traumatic neurosis. These and numerous other circumstances can and do produce prolonged disability from employment and enjoyment without incurring \$500.00 medical expenses or satisfying any

of the other supposedly "objective" standards of this Act. These victims could not recover general damages. But, if the physicians supervising the care of such victims determine to hospitalize those same patients for several days, their medical expenses could exceed \$500.00 and authorize the victims' recovery of full general damages (though their injuries and disabilities were identical).

The Act's non-monetary standards for serious injury can be equally illusory. Thus, "dismemberment" by loss of a finger tip is much less drastic than a shoulder dislocation with permanent limitation of joint motion. A simple toe "fracture" is much less serious than torn ankle muscles and ligaments. Even the apparently extreme standard of resulting "death," which authorizes full damages for "pain and suffering," can be grossly inequitable. Should the estate of a man who suffers "pain and suffering" for one minute prior to his death be entitled

to full compensation for that momentary distress (in addition to payment for pecuniary loss of his survivors), while a man who endures a full year's anguish without death is barred from any general damages?

The recent studies completed by the federal Department of Transportation further emphasize the capricious nature of the classification imposed by this Act. Thus, after examining approximately 16,000 closed injury claims in which payments were made, the Department found 124 cases involving fractures and medical expenses under \$500.00 with resulting total settlement payments averaging only \$900.00 (15 of these settlements average only \$133.00). D.O.T., Automobile Personal Injury Claims, Vol. 2, pp. 164, 166 (1970). At the same time, the Department of Transportation found 85 cases of "bruises" involving medical expenses between \$151.00 and \$500.00 with resulting settlements averaging \$4,680.00. Id. at 173, 175. And the Department found 91 cases of "strains" involving medical expenses from \$151.00 - \$500.00 with total settlement averaging \$5,561.00 (in 10 of these cases the average settlement was \$16,590.00). Id., at 169, 171.

The irrational nature of the standards set by the Act is further evidenced by reference to medical literature, which consistently states that the presence or absence of a fracture and the amount of medical expense are extremely poor indicia of the extent of injury or disability.

"Again, the X-ray may reveal multiple fractures in the skull, with the patient showing practically no signs of cerebral damage, while another patient may have no skull fracture at all and yet the cerebral damage is so extensive that death early ensues. Thus, neither the force of the accident nor the presence or absence of a skull fracture can be depended upon to evaluate the extent of trauma." Mock, Skull Fractures and Brain Injuries, p. 54 (1950).

"A person may receive a severe blow to the skull and sustain neither fracture nor injury to the cranial contents; he may receive a comparatively mild blow and sustain both a fracture and injury to the brain; he may sustain a fracture and no brain damage; he may have no fracture and very severe injury to the brain; finally, he may receive no direct blow (explosions with sudden expansion of the air in his immediate neighborhood) and yet sustain grave cerebral injury." Wechsler, Textbook of Clinical Neurology, p. 509 (1955).

"Twenty degrees loss of motion of low back in extension flexion, and rotation [from low back strain] = 12% permanent impairment of whole man. . ."

"Non-operated, clinically established disc derangement (in back) WITHOUT RESIDUALS = 5% permanent impairment of whole man. . ."

"Pelvis fractures without displacement, healed, WITHOUT RESIDUALS = 0% permanent impairment of whole man. . ."

"Fractures with displacement, healed, WITHOUT RESIDUALS, coccyx = 0% permanent impairment of whole man." American Medical Association, Guide to the Evaluation of Permanent Impairment of the Extremities and Back, pp. 97, 99, 101-105 (Feb. 15, 1958).

"Physicians all know the type of person who loves to get examined, and who keeps going from clinic to clinic and physician to physician. . . . Some of these peripatetics are hypochondriacs, and others have a pathologic fear of death. Some curious persons travel about ostensibly looking for reassurance but becoming outraged whenever they get it!" Alvarez, The Neuroses, p. 240 (1951).

Facing a very similar issue, Ohio courts recently found that a comparable provision of the Ohio Workmen's Compensation law violated the equal protection guaranty. In Fleischman v. Flowers, 25 Ohio St. 2d 131, 267 N.E. 2d 318 (1971), the Ohio Supreme Court considered a statute that authorized compensation for permanent partial disability only if the worker had been absent from work for 8 days as a result of the injury. In a unanimous decision, which affirmed a unanimous decision of the intermediate appellate court, the Ohio court held this classification

constituted a denial of equal protection for the class of injured workmen covered by the Ohio Workmen's Compensation laws:

"The provision of R.C. 4123,57, . . . limiting eligibility to file an application for the determination of the percentage of permanent partial disability. . . to persons who have received compensation for temporary total disability [requires 8 days absence from work] . . . leads to arbitrary and capricious results and thus is unconstitutional as being in conflict with the "equal protection" requirements of Section 26 of Article II of the Ohio Constitution." Syllabus by the Court. Id., 25 Ohio St. 2d 131, 267 N.E. 2d 318, 319.

"The happenstance of such absence from employment at some prior time has no logical relationship to the question of the extent of claimant's present permanent partial disability, or any relationship to the original injury. It does not establish minimum limits as to the degree of disability necessary for payment. It is not akin to a statute of limitations. Any person who, by the nature of his employment, is able to return to at least some work within seven days is precluded from even having his application considered, although the extent or degree of his permanent partial disability may be far in excess of that suffered by another employee who happened to be totally absent from employment for more than one week, and even though there be no question as to the relationship of the disability to the injury." Id., 25 Ohio St. 2d 131, 137, 267 N.E. 2d 319, 322.

We submit that there is a strong parallel between a law which abrogates the right of a worker to compensation for permanent partial disability if he returns to work within 8 days and a law that abrogates the fundamental right of an auto victim to recover general damages when he incurs only \$500.00 medical expenses.

B. THE ACT DENIES EQUAL PROTECTION BY INVIDIOUS DISCRIMINATION  
AGAINST THE POOR.

The Act deprives the poor of fundamental rights in an arbitrary and discretionary manner. When we remember that one of the principal standards for eligibility to recover full compensation is the expenditure of more than \$500.00 for medical care, the economic discrimination becomes manifest. Persons in a lower economic stratum typically incur substantially less medical expenses than the wealthy for the same physical malady, for the following reasons: (1) they have less funds to expend for such care; (2) physicians tending to their ailments restrict care for the financially oppressed; (3) the poor usually lack the education and experience to demand better or more extensive care, and (4) health care facilities in their immediate neighborhoods tend to charge less and provide less care. These familiar facts have been rather firmly established by independent studies which emphasize this unpleasant aspect of our society. See, e.g., Carlova, "Could you make it in New York City?" Medical Economics 110, 117 (Feb. 16, 1970):

"In sharp contrast to the city's high-fee plateaus are the numerous low-fee pockets in poorer districts. Consider Bathgate Avenue in the Bronx, which runs through a district that the Department of Health classifies as Health Area 24. . . . What sort of medical fees are charged in Health Area 24? A lot of the poor there depend on welfare care, of course, but those who go to private doctors get some astonishing bargains. A spot check of physicians who practice in the vicinity turned up such responses as these: 'I charge \$5.00 for an office visit, but I don't always get it.' . . . 'I'll go as low as \$3.00.' . . . 'I don't really have a fee schedule. I take what I can get, even if it's only a couple of dollars, provided it's paid in cash.' "

Nor is it any answer to say that the Act provides \$2,000.00 toward out-of-pocket expenses. Persons in lower economic circumstances will be more apt to elect available deductibles (and are being publicly urged to do so), since they are anxious to minimize premium charges at any cost. Further, they may well exhaust the economic loss protection provided by the Act in obtaining reimbursement for lost wages and thereby minimize or eliminate any protection for payment of medical bills. And, the availability of some money for medical bills makes no change in the education and experience of the indigent victim or the habits of the health care facility he is likely to contact. Therefore, the standard of eligibility for general damages is substantially a financial standard, and invidiously discriminates against indigents and lower income groups. Consequently, it is an "inherently unreasonable classification," or at the very least a "suspect classification."

The categories of eligibility for general damages would be arbitrary, unreasonable, and invidiously discriminatory under any set of circumstances. But, they are a fortiori violative of the equal protection guaranty when they abrogate fundamental rights and discriminate against lower economic status persons.

C. THE ACT DENIES EQUAL PROTECTION FOR A SUBSTANTIAL NUMBER OF  
PERSONS SUFFERING HUMAN LOSSES.

The obnoxious elements of this classification are even clearer when we  
consider certain anticipated examples:

(a) Victims A and B are passengers in an automobile that is struck by a tortfeasor. Both sustain severe strains of neck and back muscles which require their absence from work for a period of two months. A's doctor elects early hospital attention with traction and observation, at a cost of \$750.00. B's doctor directs two weeks complete bed rest and medication with 20 office visits at a total cost of medical care of \$350.00. Both doctors conclude that their patients are left with a 15% permanent partial disability. A is entitled to general damages--B is entitled to none. Arbitrary? Capricious? Unreasonable? Invidious discrimination?

(b) C is a passenger in the same vehicle and sustains a simple fracture of the small finger of his left hand. His finger is splinted in the hospital emergency room, and he has two followup office visits at a total medical cost of \$50.00. He loses no time from work and recovers from his injury completely in one month, without any residual disability. C is entitled to compensation for general damages. Arbitrary? Capricious? Unreasonable? Invidious discrimination?

(c) D and E are passengers in another vehicle struck by a tortfeasor. Each sustains a herniated intervertebral disc in his back. As a welfare recipient, D is accustomed to seeing an inexpensive neighborhood physician who charges \$5.00 per visit. E is a successful insurance executive and consults a neurosurgeon and an orthopedic surgeon who charge \$30.00 per visit. D and E each consult their respective physicians 20 times. D's medical bill is \$100.00; E's medical bill is \$600.00. Both D and E are totally disabled for 2 months. Both are found by an independent medical examiner to have 30% disability. E is entitled to general damages. D is not. Arbitrary? Capricious? Unreasonable? Invidious discrimination?

(d) D's wife is injured when two trains collide. She has less injury than her husband, less disability, and less medical expense. D's wife is entitled to recover general damages. Arbitrary? Capricious? Unreasonable? Invidious discrimination?

D. THE ACT DENIES EQUAL PROTECTION "FOR TORT VICTIMS SUFFERING ECONOMIC LOSS."

The preceding analysis of discriminatory classification related to the tort victim's right to recover general damages. Although the Act imposes different standards to restrict the victim's right to recover economic loss (special damages), we submit that this classification likewise violates the equal protection guaranty.

The tort victim is barred from recovering the first \$2,000.00 of economic loss from the tortfeasor. He may not recover medical expenses from his own auto insurer if he has paid premiums for other health insurance (Blue Cross, Mutual of Omaha, etc.). He cannot recover lost wages from his auto insurer if he has earned a wage continuation arrangement as a fringe benefit of his employment. He cannot recover the first \$2,000.00 of medical expense or lost wages from anyone if he is a member of a household that has elected to buy a \$2,000.00 deductible auto policy with or without his knowledge or consent. Section 2, 4 of Chapter 670 (Sections 34A, 34M of Chapter 90 of the General Laws).

Once again, the obnoxious elements of these classifications are apparent in certain anticipated examples:

- (a) A and B, who have paid the same auto insurance premiums, sustain similar injuries in an accident. A, a prudent and responsible person, had previously (by his thrift) procured a health insurance policy. B preferred to squander this health insurance premium money at the race track. B's auto insurer owes him \$2,000 expenses in full. A's auto insurer owes him nothing.

(b) Responsible and prudent A, by his willingness to forego a raise in salary, negotiated a wage continuation arrangement as a fringe benefit of his employment. Irresponsible B (not concerned about his becoming a welfare burden), opted for an immediate pay raise rather than a wage continuation plan. B's auto insurer owes him \$2,000. A's auto insurer owes him nothing.

(c) C and D are passengers in O's car and each sustain \$2,000 medical expense as an auto tort victim. O is C's brother-in-law and lives rent-free in C's house. O purchased a \$2,000 deductible policy to save premium charges. D is entitled to \$2,000. C cannot obtain reimbursement from anyone for any part of those bills.

We ask again--are these classifications arbitrary? Capricious?

Unreasonable? Invidious discrimination?

Part of these rules bear a close similarity to the federal Social Security provisions that impose an offset for workmen's compensation benefits received.

In the first detailed examination of those provisions, the court in Belcher v. Richardson, 317 F. Supp. 1294 (S.D. W.Va. 1970) held those portions of the Social Security Act invalid. Finding that the federal act denied equal protection, the court said at 317 F. Supp. 1298-99:

"The other issue raised by the plaintiff is that the offset provision of Section 224 creates arbitrary discrimination between two classes of disabled workers, essentially indistinguishable from each other except that one is composed of those disabled persons who also receive workmen's compensation benefits and the other is composed of those disabled persons who also receive benefits from private disability insurance plans or tort claim awards, and that on the basis of this difference alone the first class has benefits reduced while the second class has benefits left untouched. In other words, the plaintiff complains that it is patently arbitrary to single out for the purpose of applying the offset only those who are receiving workmen's compensation and exclude those who are receiving benefits from other sources. . . .

"The defendant, in justification of these discriminatory features of the offset provision, argues that its purpose was to avoid duplication of public benefits. If this be its true purpose, it is certainly a laudable one and one which this Court could wholeheartedly accept. However, the argument is inapplicable here for, as previously shown, workmen's compensation in West Virginia is not a gift from the public largesse, but rather is an entitlement arising from a contractual relationship between employer and employee, sanctioned by law, whereby each gave up a legal right in return for a concomitant legal benefit. That no public funds are involved is made abundantly clear by the provisions of West Virginia Code, 23-3-1. . . . No public funds being thus involved, the defendant's argument that plaintiff's workmen's compensation award should be treated as a public benefit obviously becomes quite untenable and must be rejected.

"In sum, therefore, it is held that in the circumstances of plaintiff's case, the application of Section 224 cannot be constitutionally applied, since to do so would deprive him of due process and equal protection of the law under the Fifth and Fourteenth Amendments."

If the legislature cannot constitutionally discriminate against those who receive public benefits, a fortiori, it cannot arbitrarily penalize those who have purchased private benefits.

# E. THE ACT DENIES EQUAL PROTECTION TO TORTFEASORS.

We have seen that the statute unreasonably classifies persons within the group of tort victims who sustain general damages or economic loss. We should also recognize that the statute unreasonably discriminates among tortfeasors as well.

One would expect that a tortfeasor would be held responsible according to the nature of his conduct, or at the very least according to the nature of the damage that he inflicts on others. But this is not the case. A tortfeasor is entitled to the immunity provided by the Act, unless he falls within certain stated exceptions which result from circumstances entirely beyond his control.

The immunity afforded to some tortfeasors extends to the first \$2,000 economic loss of the tort victim and to all general damages for a tort victim that does not meet one of the 6 scattered eligibility provisions. But, tortfeasors are subject to full liability without any immunity if they happen to cause damage to any of the following groups of tort victims: (a) an out-of-state motorist driving on a Massachusetts highway, (b) a driver whose intoxication is found to be part (but less than half) of the total negligence causing the accident, or (c) a driver whose attempt to avoid arrest is found to be part (but less than half) of the negligence causing the collision. See Section 2 of the Act (excluding them from benefits under the Act). Thus, the rights and immunities of the tortfeasor depend upon the status of the victim, with different rules of liability applying for different victims.

This Court considered a similar attempt to differentiate among persons subject to civil liability in Vigeant v. Postal Telegraph Cable Co., 260 Mass.

335, N.E. 2d (1927). In the Vigean case, the Court held that a statute imposing absolute liability on a telegraph company for damage caused by impact with one of its poles, which left unchanged the usual rules of liability for every other utility pole owner, constituted a denial of equal protection.

"The single contention here urged in behalf of the defendant is that the statute deprives it of the equal protection of the laws. That contention is based on the ground that the statute subjects the defendant and other telegraph companies to unconditional liability, regardless of their due care in the erection and maintenance of their poles, wires or other apparatus and without reference to their fault, and that no such liability is imposed upon telephone companies, or electric light or power companies, or street railway companies, and that the liability of such other companies is left to be ascertained solely by reference to the common law. This, it is argued, creates undue discrimination against telegraph companies and unequal favoritism toward other companies of like general nature.

". . . A classification for the purpose of establishing liability with respect to persons injured by poles, wires and other apparatus without fault, which singles out telegraph companies and excludes telephone companies, electric light, heat and power companies, and street railway companies, does not stand on a reasonable and just basis. We are unable to conceive of any real and substantial distinction for imposing such liability upon a telegraph company and for exempting a telephone company from such liability. So far as concerns a rational and just relation to the safety of the public and to the general welfare, there does not appear to be any real foundation for a classification which fastens such liability on the defendant and frees from such liability on the defendant and frees from such liability electric light, heat and power, telephone, and street railway companies with respect to posts, wires and apparatus."

An even stronger invidious discrimination separates the liability and immunity of tortfeasors under the present Act. See Kenney & McCarthy, No-Fault in Massachusetts, 55 Mass. L.Q. 23, 38-39 (1971).

III. THE ACT CONFISCATES FUNDAMENTAL RIGHTS BY IMPOSING  
UNCONSTITUTIONAL CONDITIONS.

In Aetna Casualty & Surety Co. & Others v. Comm'r of Ins., 1970

Mass. Adv. Sh. 1411, this Court held the rate reduction section of this very statute unconstitutional. In doing so, the Court stated that:

"The writing of insurance is a lawful business and the Commonwealth may not impose unconstitutional conditions upon the exercise of the right to engage therein. . . . The insurers are not required to either submit to confiscatory rates or go out of business. They have a right to rates which are not confiscatory. . . ." 263 N.E. 2d at 703 (emphasis added).

If the legislature cannot confiscate business interests, it certainly cannot confiscate human values.

Respectfully submitted,

RICHARD M. MARKUS  
WILLIAM SCHWARTZ

## APPENDIX A

A Few Actual Cases For Which General Damages Would Have Been Barred By New Act.  
(Information supplied from random sampling of cases by Jury Verdicts Research, Inc.)

Court, Case, No. and Date	Nature of Injury	Medical Expense	Verdict
Superior Court (Middlesex) Brown v. Correa - 6/4/65	Synovitis of knee Chondromalacia of patella Multiple bruises	\$450.00	\$25,000.00
Superior Court (Suffolk) Carey v. Congress Taxi #641,579 12/10/70	Severe prolonged headaches	\$160.00	\$16,643.00
Superior Court (Essex) Musie v. McNiff Bldg. Contr. #139,121 6/27/69	Aggravation of back condition	\$450.00	\$10,000.00
Superior Court (Suffolk) Hourihan v. Wright #602,244 5/21/68	Neck and back strain Acute traumatic anxiety and headaches	\$120.00	\$ 6,000.00
Superior Court (Suffolk) DeRenzo v. Haggerty #607,255 12/30/68	Ulnar nerve contusion	\$265.00	\$ 2,138.00
Superior Court (Suffolk) Lee v. Brown #604,706 9/28/67	Headaches Strain of neck Dislocation left and right clavicles	\$160.00	\$14,375.00
Superior Court (Hampden) Adrian v. Brocher - 11/18/64	Cervical strain Traumatic neurosis	\$400.00	\$ 4,275.00

Court, Case, No. and Date	Nature of Injury	Medical Expense	Verdict
Superior Court (Suffolk) LaFreniere v. Gibbons #590,119 2/16/68	Torn cartilage in knee of 67 year old woman	\$264.00	\$ 9,500.00
Superior Court (Essex) Simpson v. Poor #133,309 1/25/68	Deep tissue elbow lacerations	\$450.00	\$ 4,750.00
Superior Court (Hampden) Standen v. Trago #99,388 2/7/64	Aggravation of herniated disc in back	\$212.00	\$12,500.00
U.S. District Court (Vermont) O'Neill v. Wells #4340 7/20/66	Cervical sprain Activation of neck lesion Traumatic neurosis	\$270.00	\$ 6,000.00
Superior Court (Jersey City, New Jersey) Hannon v. Bollhardt #L-17076-65 7/69	Aggravation of arthritis	\$400.00	\$37,500.00
U.S. District Court (District of Columbia) Curtis v. D.C. G.S. 8273-69 -	Lumbar strain Cervical strain	\$220.00	\$19,135.00
District Court (Bismarck, North Dakota) Sczgiel v. Toffin #961 -	Traumatic neurosis	\$500.00	\$26,600.00
Superior Court (Philadelphia) MacKenzie v. Broughan #1177-35054 6/7/67	Diabetes mellitus from shock	\$500.00	\$72,000.00
Superior Court (Perth Amboy, New Jersey) Cyr v. Pollack - 5/3/70	Traumatic dermatitis	\$450.00	\$23,750.00

## APPENDIX B

COMMONWEALTH OF MASSACHUSETTS  
THE SUPERIOR COURT  
BOSTON 02108

G. JOSEPH TAURO  
CHIEF JUSTICE

August 19, 1970

The Honorable Francis W. Sargent  
Governor of the Commonwealth  
State House  
Boston, Massachusetts 02133

Dear Governor Sargent:

Since my most recent letter to you regarding the need for additional Superior Court justices, it has come to my attention that some opponents of legislation to enlarge the Superior Court contend that the recently enacted "no fault" insurance plan eliminates the need for additional Superior Court judges by doing away with a substantial portion of their workload. Unfortunately, nothing could be further from the truth.

Although the volume of automobile tort suits entered in the Superior Court is large in comparison to other types of entries, the fact is that proportionately few of them are ever tried. Consequently, they consume very little Superior Court judges' time. The minor cases remanded to the district and municipal courts and most of the remaining automobile cases are settled out of court.

A thoroughly documented study in 1966 revealed that only 13% of Superior Court judges' time in Suffolk County was devoted to the trial of automobile tort cases.

The major share of the court's time is used in processing serious criminal cases, land damage, zoning, equity, contract, products liability and medical malpractice suits, appellate review of administrative agencies such as licensing agencies, the Industrial Accident Board and the Civil Service Commission, petitions for extraordinary writs, commitments of narcotic addicts and sexually dangerous persons. *The "no fault" plan will have no effect whatsoever on these cases.* [Emphasis added]

Furthermore, the "no fault" plan applies only to relatively minor claims. These cases are customarily remanded to the district courts and only a minute percentage are ever appealed to and retried in the Superior Court. Their elimination from the judicial process will, therefore, have very little effect on the Superior Court. The more serious automobile tort cases will continue to require a Superior Court trial even under the "no fault" plan.

The Superior Court's workload may well be increased by Superior Court litigation involving the administration and application of the "no fault" plan.

The most critical problem confronting the Superior Court is not motor vehicle tort litigation but rather its spiraling criminal caseload and a constant increase in civil litigation. In no way will the enactment of the "no fault" insurance plan affect this problem. We simply do not have sufficient Superior Court judges to process with fairness, dignity and efficiency our caseload. The unconscionable accumulation of untried cases, civil as well as criminal, clearly demonstrates the need for additional Superior Court judges now. I fully concur with Chief Justice Burger's recent remarks to the American Bar Association in St. Louis:

*"If ever the law is to have genuine deterrent effect on the criminal conduct giving us immediate concern, we must make some drastic changes. The most simple and obvious remedy is to give the courts the manpower and tools—including the prosecutors and defense lawyers—to try criminal cases within 60 days after indictment. I predict it would sharply reduce the crime rate."* [Emphasis added]

In short, I do not believe that the supporters of the "no fault" insurance plan can at this time properly list as one of its features a significant reduction in the business of the Superior Court. It is my considered judgment that to forestall enactment of legislation which would give the court much needed help because of an untried theory and unproven facts would further jeopardize the ability of the Superior Court to effectively administer justice.

*G. Joseph Tauro*

## Surveys, Attitudes And Propaganda

A Critique of the Department of  
Transportation Research Report,  
"Public Attitudes Toward Auto Insurance"DONALD K. ROSS  
*Milwaukee, Wisconsin*

## INTRODUCTION

The only certain conclusion which can be drawn from this Department of Transportation report<sup>1</sup> of 266 pages is that public attitudes revealed by the sample of 3,070 family units, 2,543 of them car-owning families, are not sufficiently strong, fixed, clear or informed to provide a solid doctrinal base for proponents of change in the automobile accident reparations system.

The interviewing technique, tabulation and choice of sample are flawless in this survey by the Survey Research Center, Institute for Social Research, University of Michigan, Ann Arbor. However, there are shortcomings. Questions often fail because of omission and the technical nature of the subject matter. Thought relationships which are at disparity with reality produce slanted responses. Gratuitous remarks and debatable forecasting of future trends detract from the quality of the study.

Besides the shortcomings of the survey, serious danger exists in the use made of the study's results. Purposeful distortion to achieve an end, regardless of the means, can only lead to backlash from an irate public when it discovers that dubious change has been forced in disregard of expressed need.

The title of this study, "Public Attitudes Toward Auto Insurance," is a misnomer. Instead, much space has been given to the conflict between the principles of total no-fault proposals and the tort liability system based upon fault. These differences extend far beyond the field of automobile insurance; they reach into the basic social structure. The study blurs distinctions between the insurance and tort liability systems which are interrelated in practice but

DONALD K. ROSS, who holds both a BA and MA degree in Journalism and who taught at Marquette University for 15 years and held the rank of Professor, has been Information Director of The Defense Research Institute, Inc. since 1965.

which have separate reasons for being. One relies upon profit to exist, while providing a buffer for the individual against financial tragedy. The other, accepting values of society, applies legal principles to determine damages based upon fault. One institution does not have the right to impinge upon the other or to define its ills in mutual terms. Despite critics to the contrary, there is no public outcry directed against the basics of the fault concept.

As nearly as can be determined, the Michigan survey has presented characteristics of total no-fault reparations to its survey audience, without consideration being given to proposals of self insurance which would retain recourse to the courts in serious instances. It is with this assumption that this critique has been prepared.

## PROBLEMS OF ATTITUDE

Although the authors of the Michigan study state that the survey is intended to be objective and not to promote or support any particular point of view, perplexing conclusions as well as expressed views of personnel of the Research Center must be considered in a thorough evaluation. Entering into this problem are the limited knowledge of a technical area possessed by the researchers and the quality of guidance given by others to help frame the survey

<sup>1</sup>Department of Transportation Auto Insurance and Compensation Study, Public Attitudes Toward Auto Insurance (Mar 1970) [hereafter cited as DOT Report].

questions. Note the content, bias and oversimplification of the following statement made by a Michigan staff member:

... those people who do bad things pay those people who don't do bad things. In other words, that is the fault system. If you describe the fault system in very simple terms—as you must in a card on one of these surveys—it sounds eminently reasonable that the people who are at fault should pay the people who are not at fault. After all, what's wrong with that? Of course, as you all know, it's only in practice that this thing doesn't work well or so simply. It is very hard to establish fault. There are very large lawyers' fees very often . . . One thing which has happened very frequently is that lawyers often representing an insurance company hover over the bedside, with whispering in the ear: "You don't want a long trial, do you?" Not to mention the problem of many, many accidents where really no one is at fault, except perhaps God.<sup>2</sup>

Although the above statement cannot be used to damn the study itself, such expression is not knowledgeable, does not approach the full compass of the subject matter, is biased and attempts to relate unlike variables in a prejudicial manner. If such lack of knowledge is typical, then the research team must have been aided in forming the general sweep and nature of the survey questions which were posed to respondents. If aid in framing the questions came from those intimately familiar with the fault versus no-fault controversy, truth and objectivity might have been more difficult to attain if they had taken a pro or con position.

Communication is indeed a fine art. Slanted viewpoint or personal conviction of the questioner is easily transmitted in the interview process—through simple intonation, a lifted eyebrow or slight sneer—even if the interviewer cautiously follows the exact wording of a question as it appears on a card. An added explanation of the questions, which certainly would be needed when dealing with technical subject matter, can be distorted through personal predisposition and inadequate understanding of the interviewer himself.

If the mechanics of the survey technique matched any of these imperfections, the re-

sults are even more suspect than the following detailed critique indicates.

## PUBLIC ATTITUDE MEASUREMENT

History shows that pollsters who have attempted to measure public attitude on even the most widely discussed topics of the day have been ridiculed for erroneous projections. Difficulty of attitude measurement demands that reliable researchers present their results as tentative, complete with a percentage deviation to allow for error.

The Michigan study is filled with the proper number of such qualifications to indicate that the results are not to be construed as a solid bedrock for action programs. Those charged with responsibility for such action programs would do well to read and reread the opening sentences of the chapter titled "Summary and Conclusions":

The American people's attitudes toward automobile insurance are neither wholly favorable nor wholly unfavorable. Since auto insurance is a complex matter having a variety of features some of which may be approved and others disapproved, it was expected that a study of public attitudes would yield a picture neither rosy nor dark. Not only is the American public divided; even contradictory findings have emerged.<sup>3</sup>

Such a statement by the authors could be expanded to include the fact that tort liability and its ramifications also are not the most popular or understandable topics currently being discussed. Therefore, similar doubts regarding the reliability of public attitude in respect to the tort system and the underlying fault concept would also hold true. Difficulty of measurement and reliability are further detailed by the words of the aforementioned Research Center speaker:

... the only way you really can get at this is with a direct question, is to have one card with the details of current procedures of auto insurance and another card with the proposed system as it would be after the introduction of the no-fault system and ask consumers which one of these do you like better and why. This is extremely hazardous, however. Simply because first, . . . most people don't have

<sup>2</sup>Speech to CPCU Clinic, Des Moines, Iowa (Mar 26, 1970).

<sup>3</sup>DOT Report, note 1 supra at 9.

very firm attitudes about insurance. People have not thought too much about insurance. Secondly, it is always hazardous in survey research to present people with something which does not exist, with which they have had no experience, and ask them how they would react to this; . . . It's a little bit like asking someone if they would love their wife if she were very beautiful; it assumes a condition contrary to fact.

The consumer has a difficult time putting himself in this position. Therefore, you tend to get a reaction off the top of the head. And it is sometimes in a situation like this that consumers will focus on things which are really not very germane to the problem . . .

Most of the surveys show, however, that—for reasons that they can't explain—there is at least a 50-50 split of people preferring the new plan . . . What this means, to me at least, is that people are aware of difficulties—most particularly the high price of auto insurance—are interested in anything that promises improvement and are ready for change.

So what kind of conclusion should be drawn from this? I think the point I have been trying to make can best be summed up as follows—namely, existing attitudes toward the no-fault plan can be summarized very quickly; namely, there aren't any because it doesn't exist. What attitudes toward a no-fault plan would be were it to go into effect might be entirely different from the attitudes as currently measured.<sup>4</sup>

Elaboration on the thoughts of the speaker, related to the completed survey, is necessary. Not only must attitudes expressed in favor of a no-fault plan be labeled as tentative, they must be considered from the viewpoint that explanation by the interviewer was needed before any response could be elicited on this topic which is unfamiliar to the lay public. At times, explanation, as presented was biased in favor of no-fault because thought was linked to lower insurance costs. In all instances, explanations were incomplete regarding the deficiencies of total self-insurance proposals. Therefore, it is certain that future attitudes would change when hitherto unknown limitations of the proposals began to burden those who buy automobile insurance.

<sup>4</sup>Speech, note 2 *supra*.

In addition, the Research Center spokesman, in effect, recommends "change for the sake of change" and asks that this be done on the basis of public attitude. Admittedly, this attitude is ill-defined. Furthermore, worthwhile leadership which effects change, is not a reaction to public attitude alone. Leadership includes a reasoned approach by fully-informed specialists who, according to their best lights, should act in the public interest:

. . . I believe that the fact that this new plan does achieve such a high rating in answer to these questions shows the consumers are ready, would react very, very favorably to something which resulted in more of the money that goes into premiums going back to consumers in the form of claims payments and would cover people in the case where they are, strictly speaking, at fault and suffer a loss.

The common thread that runs through all these things (campus riots, rush hour traffic and air controllers' strikes) is that America these days has come to be very much a society where things only really get done, changes take place when a crisis gets so bad that it is seen by very many people and someone finally does something about it. Usually, it takes the form of some very dramatic, emotional individual like Ralph Nadar pointing to the difficulties . . . When things get to that point, in other words when a crisis is seen as a crisis by the majority of people, then the people who have done nothing about that crisis before it becomes a crisis get a black eye. I think the automobile insurance industry might be in that kind of a situation right now. In other words, the automobile insurance industry should not wait for attitudes of consumers to tell them that a change is needed. For the reasons that I have explained, that comes rather slowly. Rather, the auto insurance industry should take leadership in this field—get a plan which is really better for consumers before consumers perceive a crisis.<sup>5</sup>

Such a statement must surprise forward-looking insurance executives who have quietly been developing improvements in the public interest over the decade, despite the goad of politicians and other critics whose harangues admit no accomplishment and impede progress.

<sup>5</sup>*Id.*

In addition, it is impossible to state that there is a crisis on the basis of this survey or to gauge the real problems of the insurance industry as revealed by the selected letters from consumers which have been appended as a portion of this Department of Transportation study.<sup>6</sup> It must be noted that these are *selected* letters, and it is well known that only the disgruntled communicate while very few of the satisfied ever tell of their satisfaction. When it is considered that insurance is a business, a balanced view of the letters provided by the study must insist that the majority of the persons involved fully deserved cancellation, non-renewal or assignment to high risk categories. Other letters also show clearly why some insurers have renewed their efforts to control fraud.

## ANALYSIS OF SURVEY QUESTIONS

### INITIAL ATTITUDE

Early in the survey, a question sought the initial attitude of respondents:

Taking into account whatever experience you have had with auto insurance, would you say that you are satisfied or dissatisfied with it?<sup>7</sup>

In response to this question, 65 per cent expressed satisfaction and 22 per cent expressed dissatisfaction.<sup>8</sup> Only 2 per cent of those dissatisfied made any reference to the fault concept. Note that the question does not differentiate between the insurance and legal systems. Also note that the authors attempt to minimize the degree of satisfaction expressed:

Much survey experience with the public's satisfaction or dissatisfaction regarding a variety of prevailing conditions indicates that what exists at a given time can almost always be expected to be viewed as "all right" or as satisfactory by many people. This is so not only because some and possibly many people will have had either a satisfactory experience or at least no adverse experiences but also because a random sample will always contain some and possibly many people who have given very little thought to the subject of the inquiry. The latter will seldom say that they are dissatisfied. For many people auto insurance is a routine matter consisting chiefly

of more or less automatic annual renewal of their policy.<sup>9</sup>

In effect, this states that the majority will vote for an existing institution or the status quo. As a generality, the statement has merit, but it is only a generality. This is an age of criticism, directed at institutions. Most persons have had considerable experience with auto insurance, but few are tranquil during the "routine renewal of their policy" which also involves payment of increasing premiums. Other portions of the survey indicate that cost is one of the major complaints and that many believe that insurance prices have increased more than prices of other things.<sup>10</sup> For years, experts within and outside of insurance have indicated that the industry's public relations needs improving, that the public is not being reached in respect to the true merits of insurance companies. In addition, insurance has been the whipping boy of publicity-seeking politicians. Although experts understand clearly the intricate divisions within their particular fields, the public blurs such distinctions. Thus, they view all insurance as a single entity. And who hasn't had difficulty in understanding the wording of a policy? Furthermore, insurance is an intangible which is neither felt, tasted, smelled or put to any other practical use except during an emergency. The outflow of premium money is continuous; the return seldom, if ever. Like the services of an attorney, insurance is valued only during periods of high emotion. In either instance, the process is accompanied by mental strain, sometimes by physical anguish and always by outlay of time and personal energy. These facts increase unpopularity. Vigorous support of this status quo — the institution of automobile insurance — would not be automatic. Therefore, the fact that 65 per cent express satisfaction has added significance.

### SHIFTS IN ATTITUDE

Authors of the study state that toward the end of the interview more people favored a no-fault system of automobile insurance than the prevailing fault system. They also state that 44 per cent favored claiming damages from their own insurance companies only and receiving no compensation for pain and suffering, irrespective of

<sup>6</sup>DOT Report, note 1 *supra* Part II at 137.

<sup>7</sup>*Id.* at 18.

<sup>8</sup>*Id.* at 17.

<sup>9</sup>*Id.* at 10.

<sup>10</sup>*Id.* at 11.

AGENCY

which party was at fault; 31 per cent gave this opinion definitely and 13 per cent conditionally. On the other hand, 36 per cent opted for the present system in which the guilty party pays for damages, including pain and suffering; 20 per cent expressed a definite and 16 per cent a conditional preference.<sup>11</sup> This leads to the following question: "How did this change come about and is the final attitude any more reliable than the initial response?"

One cause of change is the fact that key questions, A67, A68 and A68a, were asked in respect to evaluation of the respective systems only after a long series of questions, A7 to A54, had set forth any number of dissatisfactions which might be present—delay, partial compensation, cancellation, etc. Take a happy man and point out everything which might be wrong, and he will tend toward the negative; he will become more critical of the present system when he is questioned later regarding it.

Furthermore, key questions themselves deserve careful study. Question A67, tabulated in Table VII-6 reads as follows:

Suppose auto insurance were made similar to fire or hospital insurance. Then, in case of an accident your losses—including damage to your car, hospital or doctor bills, and loss of wages—would be paid by your own insurance company, no matter whether you or the other driver were at fault. Would you be in favor of or opposed to such a system?<sup>12</sup>

It would seem natural to expect that 57 per cent would favor such a system, as described, and that only 27 per cent would give unfavorable answers. It sounds easy and fair-minded. It is doubtful that most respondents were expert in semantics; therefore, they would fail to distinguish between the phrases "similar to" as against "the same as." But there are key differences between fire and auto insurance. In fires, the cause is often found in nature; in accidents on today's highways, the cause routinely can be traced to man. The thoughtful man cannot subscribe to the theories that most highway accidents are attributable to a roll of the dice, a natural catastrophe or the intervening hand of God. Furthermore, fire insurance usually recompenses for total property loss except for depreciation. It does not pay for

loss of life or personal injury. Current no-fault proposals would not cover all damages incurred by the individual, despite the glowing description. Furthermore, the individual would have to pay additional auto insurance premiums. For example, damage to his automobile could not be assessed against the wrongdoer. Such gaps are not mentioned to the respondents in the question which was posed.

It also is telling that Question A67 does not include the problem of pain and suffering, although it is part of Question A61 which has similar purpose:

On this card you will find a list of various things people have mentioned as reasons for carrying automobile insurance. As I mention each one, would you please tell me whether you think it is a very important purpose of auto insurance, fairly important, or not at all important.<sup>13</sup>

In response to the listed choices, 46 per cent said that payment for pain and suffering was "very important" and another 37 per cent listed such payment as "fairly important."<sup>14</sup> Presumably, in response to Question A67, respondents were not aware that current no-fault proposals either would delimit or eliminate payment for general damages, "pain and suffering." A total of 98 per cent in these two categories of response also indicated that they wanted payment for property damage, perhaps unaware that such payment under no-fault would be gained only from extra insurance coverage which they, themselves, would finance. In addition, another 87 per cent sought compensation for loss of wages, probably without knowing that no-fault proposals would delimit such compensation.<sup>15</sup>

#### ATTITUDES AND COSTS

Response to Questions A68 and A68a which seek a choice between the fault and no-fault systems furnishes no reason for rejoicing by no-fault proponents. To repeat, these questions were posed after a long series which suggested numerous complaints which might be made against the present system. In addition, the element of lower cost was tied to the no-fault system. This claim of lower costs for no-fault has been successfully disputed by actuaries.

<sup>11</sup>Id. at 9.

<sup>12</sup>Id. at 73.

<sup>13</sup>Id. at 64.

<sup>14</sup>Id.

<sup>15</sup>Id.

Even if lower costs were possible, it would be gained only through reduced benefits for innocent accident victims.

It also is important that some no-fault proposals provide that auto insurance would reimburse injured persons only after other insurance and fringe benefits have been financially exhausted. Should such primary sources rule out payments for auto connected injuries, auto insurance costs would increase.

Question A68 follows as do the variables of the systems presented to the respondents:

Suppose you had a choice between two kinds of auto insurance which cost about the same. Which would you prefer?

Type X pays for all expenses of the accident (including medical costs and loss of earnings) and sometimes an additional amount for pain and suffering; Requires establishing proof that the other driver was at fault and other person has right to sue you for accident injuries; Payment by the other driver or his insurance company; Depending on the other driver having insurance or assets sufficient to pay you for your losses.

Type Y pays for all expenses of the accident (including medical costs and loss of earnings), nothing for pain and suffering; Requires no need to establish proof that the other driver was at fault and other person has no right to sue you for accident injuries; Payment by your own insurance company; Depending on the limits of your own insurance (not the limits of the other driver's insurance assets).<sup>18</sup>

Companion Question 68a reads as follows:

Suppose the second type of insurance—the one which pays no matter who is at fault—costs less than the first type; would you then prefer Type X or Type Y insurance?<sup>19</sup>

The statistical tabulation of responses by the Survey Research Center is inadequate regarding the above two questions. It states that 40 per cent favors no-fault without qualification but that 35 per cent favors fault even if it is more costly.<sup>18</sup> The "equal cost" figure is missing. In addition, the tabulation indicates that 15 per cent can

be added to 40 per cent if the cost of no-fault were lower.<sup>19</sup> On an "equal cost" basis, it would be logical to assume that the fault concept would have a slight lead since more than half of this 15 per cent figure would favor that system. It would be a case of "too close to call," based upon these two questions. However, when the order of questions and the lack of understanding of no-fault, as it truly would exist, are added, many more individuals would hew to the personal fault ethic which is a part of our Western culture. In addition, respondents who were owners and operators of commercial vehicles would vote for fault if they knew that various no-fault plans would hold them responsible whether or not they caused the accidents.

Reference is again made to an initial claim by authors of the survey that in later questioning respondents favored seeking damages from their own insurance companies and foregoing payments for pain and suffering, irrespective of fault. The margin is cited as 44 per cent against 36 who chose the current system.<sup>20</sup> It must be emphasized that cost once again enters into this evaluation. If it is admitted that no-fault would cost less, that system would indeed have the edge. Such low cost is not admitted, nor can other variables of influence previously mentioned be brushed off as fiction.

It is, apparent that cost is the leading attribute that the public uses in judging auto insurance plans. But cost differences would have to be large to change personal habits and convictions. Few persons are willing to "shop around." In response to Question A48a which asked, "Do you think that once you are insured with a generally satisfactory company you are better off sticking with it, or should you keep shopping around for a better deal?" 76 per cent said they were better off to "stick with a satisfactory company."<sup>21</sup> It also is important to note that three out of four believe that costs of auto insurance have climbed in the last few years. Many believe that the increase exceeds the rising cost of other goods and services. They tend to see the increased number of highway accidents as the major cause of this rise.

In respect to cost, a blunt misrepresentation of the study itself is found in the illustrations employed on page 82 of the publi-

<sup>18</sup>Id. at 75.

<sup>19</sup>Id.

<sup>20</sup>Id.

<sup>19</sup>Id.

<sup>20</sup>Id. at 9.

<sup>21</sup>Id. at 118.

cation. The caption reads, "When given a choice between fault and no-fault systems, more than half preferred no-fault." The foregoing shows this is patently false and will result in nurturing distortions and erroneous conclusions.

Another strong influence revealed by the study is the danger of cancellation—a potential threat to the fault concept. Most at least knew someone who was affected by cancellation. An additional influence was the introduction of delay as a part of the present system. Here, the reaction is not as pronounced because less have personal experience.

#### CONTRADICTIONARY ATTITUDES

Respondents answered two questions in a contradictory manner—roughly 60 per cent favored both the fault and no-fault systems. One question A67, previously cited, compared no-fault auto insurance to fire or hospital insurance and ended with "Would you be in favor of or opposed to such a system?"

The other, Question A65, follows:

In most states, this is how automobile liability insurance is set up now: If you are involved in an accident, you have a claim against another person (or his insurance company) only if you can prove that the other person *alone* is at fault. Would you say that this is a good system, a bad system, or what?<sup>22</sup>

In response to Question A67 which presented the no-fault system, as described, 57 per cent approved and 30 per cent disapproved.<sup>23</sup> Answering Question A65, 56 per cent approved of the fault concept, as described, and 28 were labeled as dissatisfied.<sup>24</sup> It also should be noted that the questions are not completely comparable because of wording—in one, the choice was "good system versus bad system" and in the other, it was "in favor of versus opposed to." The confusion is perhaps best pinpointed by the authors' words:

Thus very many respondents either did not see any contradiction in approving two different insurance systems or changed their opinions when they heard of a no-fault system.<sup>25</sup>

Apparently, about one-fourth of the respondents gave contradictory responses to the two plans. An additional thought was not presented to them—how many saw the necessity of a state's having to choose between the plans or how many saw them as choices for individuals to make? And it should be noted that, although the statement of contributory negligence was properly qualified as applying "in most states," no mention is made of the fact that the doctrine of comparative negligence is now a part of tort liability in Puerto Rico and 12 of our states—Nebraska, South Dakota, Mississippi, Wisconsin, Maine, Minnesota, Massachusetts, Hawaii, New Hampshire, Vermont, Arkansas and Georgia. If a decision were made for no-fault by federal governmental leaders, it would be in the face of what leaders in these states have considered an improvement in the existing system.

#### FAULT AS A DETERRENT

In still another area, a sweeping conclusion detrimental to the fault system is based upon a response to an inadequate question. Question A62 and the response purport to show that the deterrent effect of the fault system upon highway accidents is not valid. The question follows:

Some say that people drive more carefully because they know that they have to pay for damages if they hit a person. Others say that how a person drives has nothing to do with his being responsible for such damages. What do you think?<sup>26</sup>

When 58 per cent of the respondents answer that liability makes no difference in driving, the authors of the study then decry the deterrence effect of fault:

... few respondents thought that people drive more carefully because they know that they would be liable for damages if they are at fault in an accident. In the opinion of most people, how a person drives is not influenced by his legal responsibility for the damage or injury he might cause. Thus, the notion that the present liability based insurance system has an important educational or deterrent effect on drivers is not supported.<sup>27</sup>

It is important that key elements of the insurance-tort systems have been omitted in

<sup>22</sup>Id. at 72.

<sup>23</sup>Id. at 73.

<sup>24</sup>Id. at 74.

<sup>25</sup>Id. at 74.

<sup>26</sup>Id. at 67.

<sup>27</sup>Id. at 97.

this evaluation. Other questions indicate that cancellation of insurance is uppermost in the minds of numerous respondents. When a driver has repeatedly been found at fault, resultant cancellation as well as increased insurance premiums certainly are deterrents of the system. Also neglected is the entire process which calls for investigations, confrontations, a loss of time and personal inconvenience. Such are not popular and are deterrents. Also, most persons accept the group standard of conduct which has impact upon individual responsibility, and, therefore, upon the highway accident level. This group standard and individual responsibility would be weakened by no-fault. In addition to supporting these named positions, Lawrence Lawton, New York traffic consultant, has further declared that criminal law deterrence would be diluted if the impact of civil law is lost, and if no-fault were enacted, a definite increase in highway accidents, deaths, injuries and property loss could be expected.<sup>20</sup> Lawton's research is supported by other professionals.<sup>20</sup>

#### FAULT DETERMINATION

In a further attempt to show a general disregard for the fault system, the study states:

Some doubt is cast on a major conceptual support for the present tort liability system, namely, that it is the guilty party who should pay, by the finding that the American people are about equally divided in their opinion as to whether it is easy or difficult to determine who the guilty party in an accident is.<sup>20</sup>

In this respect, the general public is not a reliable guide since persons involved in an accident usually are not charged specifically with determining where the fault may lie. Fault is fixed by a painstaking process which involves insurance claimsmen, attorneys, judges, police and scientific-minded experts who have made such determinations their life work. Further-

more, whether the guilty should pay and the difficulty of determining fault are separate issues and should be so considered.

Two other major surveys of public attitude directly contradict basic premises of the Michigan study.<sup>20a</sup> One, conducted by Market Facts, Inc., of Chicago, shows that over 90 per cent indicate that most accidents are the fault of someone and that this can be determined if the facts are carefully studied; six out of 10 opposed no-fault on the basis of a comprehensive description which was presented to them; and six out of 10 also believe that "pain and suffering" is a legitimate part of damages.<sup>21</sup> Findings of the Michigan study also are challenged by a survey conducted by State Farm Mutual Insurance Company.<sup>22</sup> Here, 2,669,034 policy holders, or 94 per cent of the respondents, favored the basic precept of tort liability by affirming that "the driver who causes an accident, or his insurance company, should pay for the losses of the other people in the accident." Answering a cross-check question, 89 per cent said that cause of an accident should definitely be considered when arriving at the decision regarding payment for losses. And 72 per cent believe that those hurt in car accidents should be able to receive money not only for medical and hospital expenses but for "pain and suffering." It also should be noted that the term, "pain and suffering" in the Market Facts study was comprehensively defined in a legal framework so that respondents would know more precisely what they would be surrendering if they opted for no-fault. No such attempt was made in the Michigan study; certainly, popular definition and understanding of this phrase do not match what would be lost legally.

#### GRATUITOUS PRESUMPTION

Wishful thinking is an apt description of an unwarranted forecast of the authors.

<sup>20a</sup>A second Department of Transportation Automobile Insurance and Compensation Study, Public Attitudes Supplement to the Economic Consequences of Automobile Accident Injuries (Sept 1970) employed many of the same questions developed by the University of Michigan for the earlier survey. This study measures a smaller audience. Since the same questions are used, many criticisms of the Michigan study should be applied to this one.

<sup>21</sup>See Major Survey Demonstrates Public Support of Fault, 10 For the Defense 110 (Dec 1970).

<sup>22</sup>See State Farm Survey Shows 94% Favor Fault Concept, 11 For the Defense 15 (Feb 1970).

<sup>20</sup>Lawton, *Psychological Aspects of the Fault System as Compared with the No-Fault System of Automobile Insurance*, DRI Special Report (Vol. 1969 No. 11, Dec. 1969).

<sup>20</sup>Testimony by Dr. James C. Mancuso, Professor of Psychology, State University of New York-Albany, before Joint Legislative Committee Hearings on Insurance, Senator Bernard Gordon, Chairman, February 10, 1971, Buffalo, New York.

<sup>20</sup>DOT Report, Note 1 *supra* at 11.

Such presumption has no place in a study which is purportedly an objective search for truth. The quarrelsome statement is as follows:

A question may be raised about the probable direction of future changes in public opinions and attitudes. Should the American people receive more information during the next year or so, for instance, by insurance companies proposing the introduction of new features for automobile insurance, or through a more general public debate over the advantages and disadvantages of the tort system, will public attitudes then change? Clearly, there are no solid scientific data on which to base an answer. But the shift in opinions observed during the interviews from general satisfaction to an approval of substantial changes in the insurance system makes it probable that the widespread availability of more information about such alternatives as a no-fault plan will increase the support for a change in the present system.<sup>33</sup>

Thankfully, the authors temper their previously quoted conclusion:

As mentioned earlier, it appears that there is receptivity to change but that as of now there exists neither overwhelming support for, nor overwhelming opposition to, a change in the insurance system toward some no-fault alternative.<sup>34</sup>

As stated previously, there is no solid scientific data on which to base such a conclusion. It is doubtful that there was even a legitimate shift of attitude during the interview. Rather, the seeming shift is caused by sequence and by slant, ambiguity and narrowness of the questions. Full information about the fault and no-fault concepts could be highly damaging to the latter since deficiencies, if explained, will show that this approach is inferior to the system which has proved its worth. Programs to inform the public would not be one-sided explanations of no-fault proposals, filled with glittering generalities which could never be fulfilled. Fault proponents also would launch information programs, with full faith in an informed public. Instead of such misleading forecasting, a summary statement such as the

following would have been fair and objective:

There seems to be no strong blanketing support for no-fault as an alternative to the present system. There has been no general public outcry against the tort system. Problems of insurance are not problems of law and vice versa. Alternatives will be considered seriously by the public to the extent that they lower the cost of auto insurance or alleviate other problems such as cancellation, non-renewal and insolvencies. Conversely, they will shun alternatives which appear to raise costs or to create other problems. The public gives no mandate to any plan; what is sought is reasonable cost and a minimum of problems.

#### USE OF STUDY RESULTS

As stated, shortcomings of the Michigan study itself are unfortunate. But the real danger is the use to which the results can be turned. Consider, for example, the following statement:

The results of this survey show *clearly* that when the people are *informed* and *understand* the "no-fault" or "insure yourself" system of automobile insurance a *majority* of them recognize its *advantages* over the present system and register their reaction in favor of the "no-fault" plan.<sup>35</sup> (Emphasis added)

Prior comment in this article has shown that the survey results are not clear, that relatively little informing could go on in the short wording of the questions asked, and that there is no direct evidence that the respondents understood either the fault or no-fault concept even after having been "informed." There also is no evidence that a majority prefer the no-fault plan when the direct comparison is made. Only when the assumption of lower cost is made, does a majority favor no-fault. The spokesman is confusing the terms "majority" and "plurality." In addition, only the "advantages" of no-fault have been posed to respondents. This is also done in the continuous bombardment of the mass media by no-fault proponents. The many disadvantages are not presented.

Consider also this public statement, despite deep concern by professionals who be-

<sup>33</sup>DOT Report, Note 1 supra at 12.

<sup>35</sup>Insurance Today—Tempo of Debate Quickens on Tort vs. No-Fault Auto Insurance System, *Journal of Commerce* (Apr 15, 1970).

lieve deterrence helps to control rampant highway accident levels:

This is poppycock. We believe that 22 million auto accidents in a year is tragic enough evidence that the lawsuit system is not effective in deterring crashes. We also believe that most people are deterred from careless driving by the real threat of physical injury—both to themselves and to others. We are supported in this belief by the recently published findings of a scientific survey by the University of Michigan Survey Research Center for the U.S. Department of Transportation.<sup>26</sup>

Since the questioning of respondents was elementary and did not cover the subject even in a simplistic manner, such a conclusion is dangerous risk-taking whose end result, if approved, could result in growing

tragedy and death. The gamble is not worth it.

Hopefully, when the Department of Transportation finally speaks out on improvements needed, the statement will be calm, logical and based upon scholarship, as the use of public money dictates.

### CONCLUSION

In the final analysis, it must be said that the public voice has yet to be heard fully and recognizably in respect to what the ultimate automobile insurance and accompanying legal systems should be. It is doubtful that the public will ever speak out in terms of full understanding. Instead, honest decisions based upon the best available knowledge must be made by leaders in insurance, the legal profession and government. Those decisions must be dictated by concern for the public good, not by personal or economic interests.

## FOREWORD

For years, the Defense Research Institute and other national and local defense lawyer associations have been committed to an action program intended not only to oppose unwarranted changes in the tort reparations system but also to present a positive and unified approach to its reform in the interests of the public.

Much of our action program has been set forth in special reports and papers which have been given a wide dissemination. The major efforts in this area include the following:

- Justice in Court After the Accident
- An Analysis and Critique of the Basic Protection Insurance Plan Prepared for Study and Comment by Robert Keeton and Jeffrey O'Connell
- An Analysis and Critique of an Automobile Insurance Proposal Prepared for Study and Comment by the American Insurance Association
- Responsible Reform — A Program to Improve the Liability Reparations System
- Fault — A Deterrent to Highway Accidents

Research and writings will continue and additional publications will be forthcoming.

In addition to preparing the foregoing materials and other reports, we have brought our program to the attention of state legislatures, Congress, bar associations, other interested professional groups and the premium-paying public. We have worked closely with the American Bar Association and its Special Committee on Automobile Accident Reparations. In addition, we have worked and cooperated with numerous study groups on a state level.

There has been much study and investigation at the federal level involving the tort reparations system and its funding by private insurance. We have cooperated with all levels of the federal government in these studies and investigations. Much time and effort has been spent during the past year with the Department of Transportation

and its study of the automobile reparations system. This work has involved meetings with the Assistant Secretary charged with the responsibility of the overall DOT study, meetings with the study staff, conferences and consultation with individual members of the staff, and the forwarding of materials, reports, and the exchange of views. The defense bar has had an opportunity to present its position and opinions and to submit information, research and materials to the DOT study staff and to pertinent advisory committees.

The latest action has been to file a statement with the Senate Subcommittee on Antitrust and Monopoly Legislation chaired by Senator Philip Hart of Michigan. The Subcommittee concluded its investigation with a wide-ranging examination of the automobile repair system and invited DRI to present its views. The following statement was presented to the Subcommittee on December 16, 1969, by Mark Martin as Chairman of the Board of the Defense Research Institute. This statement is being forwarded so that you will be informed of DRI's attempts to present a unified defense lawyer approach to the federal investigators and to offer a solution for the improvement of the tort reparations system through a program of evolutionary responsible reform.

**Introduction**

As the Chairman of the Board of the Defense Research Institute, I am pleased to submit the following statement for consideration by the Subcommittee in its investigation of the so-called "Automobile Accident Reparation System." I regret that the scheduled appearance before the Subcommittee by myself, other officers and staff members of DRI, and representatives of the International Association of Insurance Counsel, Federation of Insurance Counsel and Association of Insurance Attorneys had to be canceled because of the press of other Senate business. However, we welcome the opportunity to present this statement for your consideration and would be happy to receive further inquiry from you should you see a need for additional dialogue.

The Defense Research Institute is a national, non-profit organization with almost 6000 members, headquartered at Milwaukee. The great majority of them are trial lawyers who come from all fifty states, Puerto Rico and the provinces of Canada. These lawyers engage in the defense of civil lawsuits and, in turn, are members of firms which comprise over 20,000 lawyers in those areas.

The Defense Research Institute was organized in 1961 to promote improvement in the administration of justice and enhance the service of the legal profession to the public. We have sought to carry out these objectives.

**Legal Versus Insurance Problems**

Our interest in what has come to be called the "Automobile Insurance Reparation Controversy" arose at the inception of the discussion and debate of the subject. We quickly discovered that the matter had many facets which some persons tended to confuse and group together. In addition to questions relating to the operation of the legal system involved in the auto reparation process (the tort liability system), there were also questions relating to insurance marketing, underwriting, rating and the like. Because these areas are so vast and complex and because our expertise is concentrated in one specific area, we limited our work to a study and analysis of the problems which were claimed to involve the operation of the present legal system. We decided to consider problems involving the business aspects of the insurance industry only as they relate to the tort system. Therefore, my statement will be concerned only with the operation of the tort liability system and those matters outside the system which affect it.

**Legal Questions Relating To  
The Reparation System**

Many problems and criticisms have been placed at the door of the tort liability system. Some claim that all problems, even those related to the business aspects of insurance, would disappear—the millennium would be reached—if the tort liability system were abolished. They claim that the public is dissatisfied with the tort system and would prefer some sort of no-fault approach. We believe the solution to all of these problems is more complex. We doubt that the public's attitude on such complex issues can

be gauged by the results of over-simplified opinion polls that ask whether a less costly system, free of red tape and delay, would be preferred over the present system. The tort system is based upon the principle of individual responsibility — that a person causing damage to another by careless or intentional conduct should see to it that the loss is in some way compensated. If anything is certain, it is that there has been a re-emphasis in this country of public desire for personal responsibility and accountability.

No public opinion polls are needed to know that the public wants a system that is free from excessive expense, delay and inequity. The tort liability system has been criticized for alleged excesses in each of these areas. Our research was therefore directed to determine the validity of those criticisms and the best means to correct problems which were actually found to exist.

### Delay

It has been claimed that persons involved in motor vehicle accidents must wait many months and even years before compensation is received for the injuries and damages that are suffered. This is attributed to the tort system and the rules of practice and procedure involved in its application.

However, our research of this claim has shown that 94% of auto liability claims are settled without a suit ever being filed and that only one-third of the remaining 6% (2% of the total) are tried to a verdict without being settled in some other way. Therefore most auto liability claims never reach the courts.

It is also demonstrated that these claims that do not reach the courts are settled promptly. Figures from one source show that 68% of claims are settled within 3 months; 81% within 6 months; 86% within 9 months; 89% within 12 months; 93% within 18 months; and only 7% taking more than 18 months to settle. Other sources show similar results.

It must be noted carefully that the delay in the settlement of a liability claim does not

necessarily mean that the claimant will suffer economic hardship. Most Americans receive payments for the economic loss normally associated with automobile accidents (medical and hospital expenses, wage loss, auto physical damage) through first party insurance and benefit programs which are not connected with the operation of the fault system. For these persons promptness of the payment of duplicate benefits from any auto reparation system is relatively unimportant. This is demonstrated by the experience that the American Mutual Insurance Alliance had in experiments with its Guaranteed Benefits program. This is a plan which offered a claimant the option of seeking his normal tort recoveries or taking limited first party benefits in their stead. A reluctance on the part of many of the claimants to give up the right to seek tort recoveries in exchange for the no-fault, no-delay, no-red tape Guaranteed Benefits was found. One of the reasons ascribed for this reluctance was that the claimants were in no hurry to settle their claims since their out-of-pocket losses were covered by other non-auto insurance plans.

What of delay in our courts? When debate as to the merits of the present reparation system began, its critics made statements interpreted as meaning that long delays in the courts affected almost every litigant in almost every jurisdiction throughout the country. The typical claim was that there was an average delay of two and one-half years. The reason for this delay was said to be the auto accident case and the impression was given that if these cases were eliminated congestion would soon disappear.

We set out to determine the validity of these allegations and conducted two surveys to determine the true status of backlog in the country's courts. We found that far from affecting every court and every litigant, delay was limited to a small number of metropolitan jurisdictions. Admittedly this involves a large number of people. Other studies have shown that auto accident cases take up only a small percentage of the judicial time. The real culprit of court delay was found to be an increase in all judicial business and the failure to increase the number of judges

and court facilities to keep apace with population growth. In Manhattan and the Bronx in New York, for example, not one new judgeship was created for 43 years prior to 1968. However, the courts in other areas of large population density have no delay since there are provisions for the creation of a new judgeship based upon an increase in the population.

### Cost

Another of the major criticisms of the present auto reparation system has to do with the cost of its operation. The statement: "I'm paying too much for my auto insurance" is heard quite often. However, we also hear similar statements with regard to the cost of food, housing, services, interest rates, taxes and many other items in the typical family budget. The fact is that inflation has been no stranger to the cost of auto insurance or to the cost of all other consumer goods and services. In fact the cost of many of these items has risen much more sharply than have insurance premiums. There is no question that some persons pay very high insurance rates. However, statistics issued a short time ago showed that the average annual premium paid by motorists in the United States for \$10,000/20,000/5,000 was only \$79.64. It is not uncommon to find persons paying more to park their cars for eight to ten hours a day, five days a week than they pay for auto insurance protection which is in force twenty-four hours a day, seven days a week.

The impact of inflation upon auto insurance rates is more noticeable because the premium is paid once, or possibly twice, a year. Twelve dollars added to a yearly bill which was previously sixty dollars creates more of an impact in the mind of a person paying it than does one dollar added to a monthly bill that was previously five dollars. However, the annual increase is just the same. The fact remains that auto insurance is not the most costly item of expense associated with the operation of a motor vehicle. A study conducted by the Bureau of Public Roads showed that the cost of gasoline and oil (excluding taxes);

garages, parking and tolls; maintenance, accessories, parts and tires; and depreciation each exceeds the cost of insurance. Yet, the cost of these items is spread out through the year and insurance is purchased in one or two installments.

With all the discussion and debate over the high cost of the reparation system, sight is often lost of the fact that the typical automobile insurance premium includes charges for more than liability coverage. Most motorists now carry medical payments, collision and comprehensive, and uninsured motorist protection as well as their normal liability coverages. Yet, the typical premium payer tends to view his automobile insurance bill as an indivisible whole.

Only recently has real consideration been given to the most costly item in the automobile insurance premium statement. Recent testimony before this committee has demonstrated that the cost of coverage for damage to motor vehicles has been increasing at a rate more rapid than the coverage for personal injuries. One recent report indicates that over two-thirds of the typical automobile insurance premium is spent for coverage for physical damage to vehicles. A change in the method of compensation from the present system to some no-fault plan would have no effect on the cost of repairing motor vehicles.

Our studies of the matter of insurance costs have shown that there are two basic reasons for the increase — inflation and rising accident tolls. We believe that any proposals for change or modification of the present system must, of necessity, take these two factors into consideration. Any plan for change which seeks to lower costs by merely redistributing benefits and which does not take these two factors into consideration, will produce only artificial cost reductions which will be dissipated as inflation and accidents continue.

### Inequity

Some claim that the present tort system is inequitable since some persons injured in motor

vehicle accidents receive no compensation. The tort system is not intended to compensate everyone. The system is based upon the principle that one who causes injury to another by careless or intentional conduct should fairly and adequately compensate the injured person. This principle is deeply ingrained into the basic ethic of our civilization. Over the years the application of this principle has been strengthened, rather than limited, as various rules and procedures in the law which prevented its application have been stripped away. The trend has been to extend the principle of liability based upon fault to persons and organizations previously immune rather than to create more immunities. This ability of the tort system to modify in accord with society's needs is one of its most valuable characteristics.

It is true that there are persons who do not recover under the tort system because they are unable to trace their damages to the fault of another. Whether these persons should receive some form of compensation is a question of social policy and not legal policy. However, the nature of this problem must be carefully studied to determine its exact magnitude. We believe that in attempting to solve the problem, to whatever extent it actually does exist, the basic legal rights of those persons who can gain recovery under our present legal system should not be abrogated. If basic legal rights are destroyed in the name of social expediency, all men will eventually be the losers.

### No-Fault Plans and Proposals

In addition to studying the problems which have been attributed to the operation of the present tort liability system, we have also analyzed the proposals which have been proffered as claimed solutions. Some assert that what is needed is drastic change. They claim that the present system cannot be improved sufficiently to alleviate the problems to any significant extent. What

has been proposed are forms of no-fault, first party insurance coverages under which each person injured in an automobile accident would look to his own insurer for benefits. It has been claimed that such no-fault proposals would result in the prompt payment of claims, reduced insurance costs and more equitable treatment of claimants. We have carefully studied these plans and proposals to determine if they would produce the results which their proponents have claimed.

### Speed In Payment

The first advantage claimed of no-fault proposals is speed in the payment of claims. It has been asserted that the adoption of no-fault would result in a system under which all claims would be promptly paid without red tape, similar to the manner in which fire and health insurance claims are paid. While this is what proponents of the plans intend, there is no question that disputes between insurers and insureds would arise, resulting in litigation. Practices and procedures for resolving these disputes are written into two of the most widely publicized plans — Keeton-O'Connell and the American Insurance Association plans. A considerable amount of litigation presently arises under the medical payments provision of the standard auto insurance policy. This is first party, no-fault insurance.

Therefore, even though no-fault plans are designed to reduce delay and speed payment, all claims would not be promptly paid. There is no way to determine whether more claims would be paid promptly under a no-fault plan than under the present system or whether there would be more or less litigation. However, as was previously noted, the majority of claims are now settled promptly and without litigation. In addition, since most Americans presently have non-auto, first party insurance and benefit plans which duplicate the type of benefits offered under a no-fault system, there is a serious question as to whether prompt payment of duplicate benefits is really wanted or needed.

### Claims Of Reduced Cost

One of the most significant claims made for the advantage of adopting a no-fault auto insurance proposal is that the cost of insurance to the public would be reduced.

As lawyers, we do not claim to have the knowledge of insurance actuaries. We must rely upon the studies of others to ascertain the facts of this matter. Proponents of two of the most widely discussed no-fault proposals — the Keeton-O'Connell and American Insurance Association plans — have claimed that insurance costs would be lowered if such plans were adopted. However, other actuaries have studied the same proposals and have asserted that insurance costs would not be reduced; instead even higher insurance costs might result. As lawyers, we do not presume to assert that one set of actuaries is correct or that the other is wrong. All that we can ascertain from this matter is that a serious difference of opinion exists. This alone should be reason for serious reflection. No one knows better than members of the legislative branch that the cost of many projects and proposals, conservatively estimated before implementation, have ballooned all out of proportion when practical application is attempted.

There are observations as to the cost of no-fault we can make which do not require the expertise of an actuary. The first and most obvious is that an inexpensive product is not always a quality product. More specifically, under no-fault plans such as the Keeton-O'Connell and American Insurance Association proposals, the purchase of this coverage is a condition precedent to the registration and operation of a vehicle in a state enacting the plan. However, no provision is made under such plans for the motorist who has adequately protected himself and his family against the losses covered by the plan through other sources of indemnity. There is no way for him to avoid purchasing unneeded coverage. He is forced to pay another premium for duplicate indemnity. The plight of this "over-insured motorist" is further complicated under

some plans. For example, no benefits would be paid under the Keeton-O'Connell proposal if the insured received duplicate benefits from another source. Thus, under such a plan, this insured would be forced to buy coverage he does not need and under which he will be able to make no recovery. Even without such a setoff, it is inconsistent for plans which are offered for the stated purpose of reducing the cost of insurance to force persons to buy protection they do not need.

It should also be noted that the benefits to be paid under no-fault proposals are limited. Typically, benefits are received only for wage loss (up to a stated maximum per month), hospital and medical expenses and, in some cases, a limited death benefit.

Thus, no-fault forces a person to buy types of indemnity coverage that are presently available — if really wanted — from other sources. No-fault would pay only limited benefits for damages arising from auto accidents, while other sources cover a more broad spectrum of losses. Persons covered by the other sources would have no way of escaping the compulsion of buying unneeded, duplicate coverage. In some instances, persons forced to buy unneeded, duplicate coverage would be denied its benefits. Finally, all persons forced to buy this no-fault package would also be forced to give up the right to recover compensation for the pain, discomfort, disability, disfigurement and suffering caused by the fault of another to seal a bargain which many of them did not need but could not avoid. This may turn out to be a cheap product but we do not believe it is a quality product.

### Equity Of Compensation

Finally, it is claimed that a change from the present system to some no-fault scheme would result in equity since all persons injured in motor vehicle accidents would be entitled to the same type of benefits. Such a promise has, at best, superficial appeal. This is the most disturbing feature of the no-fault mystique.

The proponents of such plans realize that to compensate all—the persons who cause accidents and their innocent victims alike—it would be economically impossible to offer compensation similar in scope to that which is now provided under the tort system. Their solution is simple: reduce the scope of the benefits available to innocent traffic victims and pay these reduced benefits to everyone. The innocent victim is denied compensation for his scarring so that he and the drunk who ran into him can have their hospital bills and lost wages reimbursed. The innocent victim is denied compensation for the pain and suffering associated with a broken limb so that he and the reckless teenager who cared more about kissing his girl friend than which side of the road he was on can have their medical expenses paid.

This promise of the no-fault proponents is not for equity, it is for blind equality. While our constitution promises equality before the law, it does not promise equal treatment by the law. We do not jail the robbed with the robber, the assaulted with the assaulter. These plans do not seek to do justice. Rather, they attempt only to create limited funding schemes on the theory that it is too expensive to provide full and just compensation for the innocent victims of auto accidents. They set up the equivalent of boards of adjustment to fix allotments for injury and damage by formulae and percentages with no concern for the determination of responsibility for the loss or adequate compensation.

We do not oppose having insurance protection available for those who are injured through their own fault or through events which cannot be traced to another's fault. Such protection is now available for those who need and want it. We are opposed to any proposal which seeks to establish and fund such a system by restricting and reducing the compensation due to persons who are injured through the carelessness or intentional conduct of others. Such proposals violate the basic sense of fairness and justice which is inherent in our society. For your additional information we have attached Appendices A and B to this statement. They contain the results of the detailed analysis we have made of two of the most discussed no-fault proposals.

## Improvement Of The Present System

Our study has led us to believe that the basic principles which underlie the present automobile accident reparation system are sound. We believe that where problems do exist they can be resolved by modification and change within that system's basic framework. We have expended much time and effort to determine the best method in which this could be accomplished.

The first official statement of our position in this regard was contained in the special report, **JUSTICE IN COURT AFTER THE ACCIDENT** which was issued in January, 1968. It was developed by the Defense Research Institute in conjunction with the International Association of Insurance Counsel, Federation of Insurance Counsel and Association of Insurance Attorneys. A copy of that special report is filed with this statement as Appendix C. In **JUSTICE IN COURT** we stated our belief in the need to preserve and improve the present system and provided a broad blueprint for the areas in which this improvement could be achieved.

Although much time, effort, study and analysis went into the development of **JUSTICE IN COURT**, it was viewed by the four issuing groups as only a first step. Work was immediately begun to take the general principles of **JUSTICE IN COURT** and develop them into specific proposals for reform of the present system. That work culminated in a second special report by the four groups which is entitled **RESPONSIBLE REFORM—A Program To Improve The Liability Reparation System**. A copy is also provided as Appendix D to this statement.

We believe that the proposals contained in **RESPONSIBLE REFORM** would make the present system of automobile accident reparations less costly, more expeditious, more equitable and efficient, all within the framework of a system which is supported by the American public and which has proven its ability to adapt to changing circumstances.

13-100000

### Cost Of System

Several of the proposals found in RESPONSIBLE REFORM are concerned with the cost of the present system. The first of these deals with highway safety.

If a railroad train carrying dangerous chemicals were to explode in the midst of one of our most populated cities causing death to 150 persons and injuries to 14,000 others, the halls of Congress would reverberate with demand for immediate investigation and meaningful action. Yet, in 1968 that was the average daily motor vehicle accident toll. Great numbers of persons have marched in our streets demanding our disengagement from the Vietnam war. Yet, more persons have been killed and injured on our nation's highways than in all our wars. If a drug in common use in this country was found to be responsible for the death of 25,000 of our citizens, it would be summarily ruled off druggists' shelves. Yet, a report by the Department of Transportation shows that 25,000 persons lost their lives during one year in highway accidents caused by the use of alcohol, but laws concerning drinking and driving remain miserably weak. At a time at which our national priorities are being challenged, highway safety programs are being relegated to the back page of news publications, ignored by television and granted only token attention by legislatures.

We believe that, in addition to saving human life and suffering, the only way to significantly reduce the cost of the automobile accident reparation system is to take decisive and meaningful action to curb the number of accidents which occur on our streets and highways. Anything else would be an expedient stop-gap. We believe that much could be done to improve highway safety if greater concentration were placed on the motorist as the cause of accidents. Studies have shown the high involvement of alcohol and drug use as a cause of traffic accidents. The families and friends of the persons killed and injured in those accidents would not be convinced by arguments of no-fault proponents that accident causes are hard to prove. It has also been shown that traffic deaths and injuries could be

reduced by a substantial percentage if only a small number of habitual traffic law violators were ruled off the road. We believe that driving is a privilege and not a right. Therefore in RESPONSIBLE REFORM we have set forth certain proposals to deal with the accident producers. We have proposed legislation for mandatory license revocation and fines for those convicted of operating a vehicle while under the influence of alcohol and drugs; permanent license revocation for habitual traffic law violators; penalties for pedestrians who cause accidents while under the influence of alcohol or drugs; uniform licensing standards for drivers with periodic examination for driving competence; and mandatory use of motor vehicle safety equipment including seat belts and motorcycle safety helmets. We will also lend our support to all meaningful proposals of others to protect the careful motorist from those who abuse their driving privilege. While proponents of no-fault seem to treat all accidents as inevitable and are only concerned with treating the results, we are concerned with the cause itself.

### Fault As A Deterrent

As part of our concern with the driver as an accident producer, we were troubled by the claims of some that a shift to a no-fault auto reparation system would have no effect on highway safety. We were troubled because those who made the claims presented no empirical data. We believed that too many persons are already being killed and injured on our highways and that this subject is so important that decisions regarding it should not be made upon the basis of speculation and conjecture. We sought to study the problem.

Lawrence Lawton, a professional engineer and long-time traffic consultant from Westchester, New York, was commissioned by the Defense Research Institute to direct the research.

In a thoroughly documented study he has shown conclusively that the present fault system applies all possible psychological deterrents to highway accidents. In direct contrast, he concluded that adoption of a no-fault proposal would increase accidents, deaths, injuries and economic loss to the American public.

In his study, **PSYCHOLOGICAL ASPECTS OF THE FAULT SYSTEM AS COMPARED WITH THE NO-FAULT SYSTEM OF AUTOMOBILE INSURANCE**, Mr. Lawton utilizes empirical data gathered from numerous and authoritative psychological studies. He shows that group standards and their exercise have definite impact upon individual behavior of drivers. Under the fault system, the frequency of contact with established group values is optimum. In addition, aggressiveness which is the cause of many accidents is curtailed. Impact of the group standard would be non-existent under the no-fault proposals since pressure of community abhorrence against those who cause accidents would not be brought to bear. Thus, the deterrence of society's standards would be destroyed. Since there is no fault and accidents would be considered a result of random chance under that system, aggression would run rampant through a series of minor accidents. More minor accidents would ultimately result in more major accidents which kill and maim.

Mr. Lawton has also concluded that criminal law is not adequate in itself to curtail highway accidents. He notes that the present system's use of increased auto insurance premiums for bad driving practices would not be an influence under no-fault compensation plans.

Mr. Lawton has arrived at his conclusions on the basis of system analysis and has added his lifetime personal experience to analysis of experimental data. We believe his conclusions are correct. He warns against accepting the opinions of amateurs with regard to this subject before their theories have been adequately tested. The lives of drivers, passengers and pedestrians cannot be gambled on unsupported conjecture, particularly when such expert research indicates that the gamble would be lost by a shift to the

no-fault concept. We have provided a copy of a summary of Mr. Lawton's study as Appendix E to this statement.

Returning to the proposals of **RESPONSIBLE REFORM**, we also believe that the cost of the system, in terms of returning more money to deserving claimants, could be reduced if the abuse of the contingent fee system were checked. At the present time, no workable approach has been fashioned to allow actual legal expenses to be recovered by a successful litigant. Until one is, the contingent fee system provides the only means by which a person who is financially unable to retain counsel on some other basis may have his day in court. For that reason, the contingent fee system has proved beneficial. However, it is subject to misunderstanding and abuse. Those who abuse it are small in number, yet they bring the entire profession, and especially those who are conscientious in the use of the system into disrepute. The proposals found in **RESPONSIBLE REFORM** would make the contingent fee the subject of strict court control. It would also seek to correct some of the misunderstanding about the operation of the contingent fee system by requiring information as to its application to the specific case to be given to the client.

We also put forward proposals relating to the modification of the collateral source rule, control of fraudulent claims and efficient use of the legal effort. Since copies of **RESPONSIBLE REFORM** are available and self-explanatory, I will not discuss them in detail. However, each in their own way, would make the present automobile accident reparation system less costly.

### Speed In Payment

There are three specific proposals found in **RESPONSIBLE REFORM** which seek to expedite the compensation of persons injured in automobile accidents.

The first is a proposal that every automobile liability policy covering any private passenger vehicle, on a non-fleet basis, provide minimum stated first party coverages. These would be for medical and hospital expenses, uninsured motorist protection, income disability and accidental death benefits. They would protect the named insured and members of the family of the named insured residing in his household and would provide similar coverages to guest passengers injured while occupying the insured vehicle who are not afforded such protection by sources collateral to the insured's policy.

We differ in our approach to first party coverage from that proposed in no-fault plans. Although these benefits would be provided on a no-fault basis, they would not affect the rights of the injured person to seek tort compensation from the person causing him injury. In addition, the insured would not be compelled to purchase this coverage if he believed he was adequately protected by his other first party insurance and benefit plans. He would have the right to reject it as it affects himself and resident members of his family. He would not be able to reject this coverage for guest passengers. However, those passengers would be protected by the insured's coverage only if they did not have benefits available from other sources.

We believe that this approach is superior to that offered under a no-fault plan, since it offers protection only to those who need and want it.

RESPONSIBLE REFORM also seeks to alleviate the problem of congestion and delay in the courts. We have proposed that sufficient numbers of judgeships be created to meet the needs of society caused by population growth. Presently judges are shifted from civil to criminal litigation so that persons accused of crimes may have the charges against them disposed of promptly. We believe that the taxpaying, law-abiding citizen should have an equal right to the prompt disposition of civil litigation. We believe that creation of more judgeships will help to alleviate the problem of delay where it presently exists and also will prevent delay from occurring in those metropolitan jurisdictions which are not now troubled with the problem.

RESPONSIBLE REFORM also contains a proposal aimed at easing court congestion and delay in the few metropolitan areas where it now exists. We have proposed that a system of mandatory arbitration of all lawsuits involving claims under \$3000 be adopted in those jurisdictions. Matters are to be disposed of by panels of lawyers without the expense of more court personnel and facilities. This approach is presently working well in Philadelphia, where court delays for claims under \$3000 were reduced from 30 months down to only 30 days, and we believe will effectively reduce delay elsewhere.

We also believe that the insurance industry has been doing much to expedite the payment of personal injury claims through advance payments programs which provide claimants with funds for economic loss before liability is determined. RESPONSIBLE REFORM contains a proposal which would aid insurers in continuing and expanding this effective process.

### Efficiency and Equity Of The System

Several of the proposals found in RESPONSIBLE REFORM are concerned with improving the efficiency and equity of the reparation system. There has been considerable debate over the merit of adopting a system of comparative negligence to replace the rule of contributory negligence. Our proposal is that the determination of whether the rule of contributory negligence should be abandoned is a matter for local determination but that when the rule is to be changed, the present Wisconsin comparative negligence rule and procedure is preferable and should be substituted. We do not believe that the problem has a national solution. What may be workable in one area of the country may not succeed in another.

We have also proposed the modification, addition or elimination of many legal practices and procedures. We believe that many procedures continue to be followed simply because they have been used for a long time. They add nothing to the efficiency or effectiveness of the system.

Other procedures need to be added or brought up to date to make the system as efficient and effective as possible. Again, space limits their discussion in any but this limited manner.

Finally, we have concerned ourselves with the question of pain and suffering. Proponents of no-fault plans tend to imply that there is something immoral about paying an accident victim for anything other than his direct economic loss. If pressed on this point, they generally retreat to the position that it is impractical to pay for general damages since they are hard to measure.

The mere fact that an accident victim cannot produce a signed receipt for all of those damages does not mean that no loss has been incurred — nor that it is so unimportant that it should be disregarded. In actuality, the major portion of the money paid for general damages is not for "pain and suffering," in the literal sense of that term. It is for such items as bodily impairment, disfigurement, temporary or permanent interference with normal activities, the inconvenience and disruption of personal plans, and — in the case of permanent disability — of the immeasurable but nonetheless real diminution of the victim's prospects for business success, marriage and continued happiness.

There are some who propose that the compensation for pain and suffering be completely eliminated. Others propose that formulae be developed so that compensation for pain and suffering can be computed upon a multiple of some item of the claimant's out-of-pocket expense. We believe that a person should continue to receive full compensation for tortiously caused pain and suffering. We believe that a person should not be denied recovery for pain and suffering simply because its severity does not measure up to some artificial quantum. We are convinced that juries have been performing their function of setting compensation for these losses well and that every effort should be explored to aid their task.

21

## Need For Continued Study and Improvement

These then are the proposals of RESPONSIBLE REFORM. We do not suggest that the proposals are a panacea. Other groups including the American Bar Association have studied the problems and proposed programs of reform within the framework of basic legal doctrine. Much found in the report of the ABA Special Committee on Automobile Accident Reparations, which was approved by the American Bar's House of Delegates last August, finds support in RESPONSIBLE REFORM. Likewise, support for the proposals of RESPONSIBLE REFORM is found in the ABA Special Committee report. We believe it is significant that the American Bar and the four groups which sponsored RESPONSIBLE REFORM have agreed on the position that the present system is worth preserving and can be improved within its own framework. It is also significant that each has found proposals which seek to limit the compensation now available to innocent victims of traffic accidents contrary to the public interest.

When we first began our study and analysis of these problems we were certain that, should we find the present system was worth preserving, we as lawyers would be labeled as subjective defenders of the status quo, more interested in preserving our self-interest than the public's. Therefore, we were placed in the unenviable position of being required to either approve proposals which we found to have no merit or having our integrity challenged if we were critical of such proposals. It would be naive to suggest that members of the Bar do not have a financial interest in the present system which provides a means to earn their livelihood. However, it does a great injustice to the members of the Bar to suggest that they are unable to objectively analyze proposals which would greatly affect the public interest. As defense lawyers we could have taken the safe and expedient position of spectators to this controversy. In so doing we

22

would have avoided the possibility of causing antagonism to be created against us by some of our major clients. We could live very well under a no-fault system. Other areas of the law are increasing at a rapid pace and new legislation always results in the need for the services of one skilled in the law. There would surely be litigation under the no-fault plans themselves. However, we believed that it was incumbent upon us as attorneys to resolutely carry out the obligation we embraced with our oath to lay bare flaws of any proposal which would lead to the deprivation of the basic rights of the public — no matter what the personal cost.

We knew that ours was not an easy task since, ironically enough, a system of law was judged and condemned before all the evidence was collected or a defense presented. In support of this statement all we need do is look to the Congressional Record and examine the statements made in support of the resolution calling for the Department of Transportation investigation.

Nevertheless, we have completed our studies, have made our proposals and place our integrity behind them. We will lend our support to the implementation of these proposals and any others which are found similarly sound. We will also re-examine our recommendations in the light of future developments and will add, modify or change proposals if events indicate that the interest of the public merits such action.

We will never in right conscience be able to approve of no-fault schemes which deny innocent victims the right to just compensation for loss caused by another's carelessness and recklessness. No-fault plans are offered as cure-alls for all of the problems, real or imaginary, which are claimed to beset us — just as the medicine show peddlers of the past offered a magic elixir claimed to cure everything from baldness to fallen arches. The "medicine man's" standard pitch was to caution the people not to listen to what their family doctor had to say about the product. He would be against it because of the fear of being put out of business by the wonder tonic.

We believe that no-fault is something that the public does not need and, in possession of all the evidence, would not want. We do not mean to impugn the motives of those who propose such plans. We are convinced that they truly believe in their merit. Although they have spent much time and effort in developing these proposals, pride of authorship sometimes tends to dull objectivity. On the other hand, lawyers did not create the principles of individual responsibility and accountability — they arose from a time more ancient and a power greater than mortal man. However, part of the stewardship for maintaining these proposals has been entrusted to lawyers and we as members of the legal profession intend to fulfill that trust by protecting, perfecting and maintaining the principles of individual responsibility and accountability.

## Foreword

**I**N OUR civilized society, we recognize the right of each individual to seek redress in a court of law, and according to the mores of his society, for the wrongs done to his person or property. This process has been thoughtfully and carefully developed for the common good and to serve the best interests of each individual.

The end of our system of jurisprudence is justice, as complete and tailored to the rights of each litigant and the needs of each lawsuit as can be developed by man. The greatness of our system lies in the fact that the results of each case determine whether justice was truly done. While all men are entitled to equal justice under the law, it is recognized that the facts and circumstances of particular cases differ so greatly that no abstract rule can be established which will automatically provide justice in every case and for each litigant.

However, society has created general rules of conduct so that, based upon the circumstances of a particular situation, it can be determined whether someone's rights were transgressed. We believe that men who enter into a legal contract should be bound to carry out its terms. We oblige a man who damages property to compensate its owner. We believe that one who is injured through the carelessness of another should be compensated by the person who was responsible for causing the injury. All of these concepts and many more stem from society's deep concern with individual responsibility. The principle that the rights of citizenship carry corresponding responsibilities is securely woven into the fabric of our society.

Of late there have been claims by some that these principles of individual responsibility, at least as they relate to reparations for injuries sustained in auto accidents, are archaic and no longer have a valid place in our society. Concern is expressed for persons who are injured in auto accidents and receive no compensation from the auto reparations system because their injuries are not traceable to the carelessness of any third person. Plans are pro-

posed to absolve the careless motorist of any responsibility to the person he injures and to require all to protect themselves from this type of loss through the purchase of limited protection insurance.

While it must be admitted that some problems do exist in the operation of the present auto accident reparations system, it is clear that the no-fault plans that have been proposed do not seek to meet and correct them so that our system of justice will be improved and preserved. Rather, they attempt only to create limited funding schemes on the theory that it is too expensive to provide full and just compensation for the innocent victims of auto accidents. These plans do not seek to do justice but set up the equivalent of boards of adjustment to fix allotments for injury and damage by formula and percentage with no concern for the determination of responsibility for the loss or adequate compensation.\*

It is said that the needs of those who recover nothing from the present system due to an absence of provable fault are not met by our present system of justice. But this argument confuses justice with the concern that all men have for their unfortunate neighbors. There is serious question as to whether this problem is as great as claimed. But if it is, the solution should lie outside the framework of the law, the end of which is justice and not charity. If justice is destroyed in the name of charity, all men will eventually be the losers.

The Defense Research Institute is fully committed to the preservation of individual responsibility and to the preservation of the right of the innocent victim of another's carelessness to recover just compensation from the person who caused that loss. For this reason this Special Report was prepared analyzing the no-fault auto compensation plan offered for study and comment by the American Insurance Association and entitled "The Complete Personal Protection Automobile Insurance Plan." We believe it necessary to give the

\*See Davitt, *The Elements Of Law*, at 243 (1959)

public, Congress, state legislatures, the bench, the bar, the media and all others concerned with this subject a detailed analysis of the plan so that they may place it in its proper perspective. Most of the noted shortcomings in the plan are similar to those found in other no-fault proposals. Their concern is to provide some limited compensation to all who are injured in auto accidents, even the careless and reckless driver, and to do so at the lowest possible cost. To do so they deprive the innocent victims of these accidents of the full measure of compensation they are entitled

to under our present system of justice. DRI is opposed to all plans that provide for the settlement of disputes between individuals on a no-fault basis since they are not in the public interest. Nevertheless, DRI is mindful of the fact that the AIA study may be helpful in the development of proposals that can better serve the public without impairing the basic concept of fault.

Defense Research Institute  
February 1, 1969

## Synopsis Of The Critique

**I**N THE following pages the plan offered for study and comment by the American Insurance Association, entitled "The Complete Personal Protection Automobile Insurance Plan," as set forth in its *Report Of Special Committee To Study And Evaluate The Keeton-O'Connell Basic Protection Plan And Automobile Accident Reparations*, dated October 21, 1968 is analyzed. Despite the apparent good motives of AIA in offering the plan it is concluded that, for the following reasons, the plan should not be adopted:

	<i>Page</i>
1. The entire fabric of the tort system is constructed around the principle that one who causes injury to another should fairly and adequately compensate him for the injury. The plan eliminates this responsibility and treats the careless motorist as the equal of the person injured by his careless conduct .....	6
2. The plan would force motorists to purchase insurance to protect themselves against loss caused by the careless conduct of others. For many this new coverage would unnecessarily duplicate existing coverages .....	7
3. The plan would sacrifice basic legal principles in the interest of a competitive advantage in the market place .....	7
4. The plan's limitation on recovery for work loss clearly discriminates against 30% of the population .....	8
5. The plan would eliminate recovery for impairment of earning capacity which can be a substantial loss to many injured workers .....	8
6. The plan would eliminate all recovery for pain, suffering and inconvenience suffered by innocent victims of traffic accidents caused by careless drivers .....	8
7. The plan provides only limited benefits for disability and disfigurement based upon an arbitrary formula, not the nature and extent of the injury .....	9
8. The plan would force owners of vehicles to pay the cost of repairing automobile damage caused by carelessness of others .....	10
9. The promised reduction in insurance costs under the plan is dubious and may not materialize .....	11
10. The rating structure of the plan may result in higher premiums for careful drivers and lower rates for those who cause accidents .....	13
11. The areas of potential controversy between the insurer and insured are greatly increased and are likely to cause increased litigation. In addition, other civil litigation may increase if the plan were enacted .....	14
12. Once enacted, the plan is likely to be found unconstitutional, based on violation of the due process and equal protection clauses .....	16
13. The plan is far from being a "complete" or "personal" protection plan .....	20

## An Analysis And Critique\*

### ELIMINATION OF TORT-FAULT

Under the American Insurance Association (hereafter referred to as AIA) proposal, the fault of a person causing an automobile accident would not be considered to determine his benefits. This means that the careless or inattentive driver, the speeder, the reckless or drunken driver would be treated as the equal of the innocent accident victim who is injured as the result of such conduct.

One of the stated "basic principles" in the development of the plan was:

Fault is not a proper factor to determine reimbursement for motor vehicle accident injuries.<sup>1</sup>

The proposal does not set forth the reasons which led to the adoption of that principle. Its validity is clearly open to serious debate, especially since so much emphasis has been placed on law, order and individual responsibility in recent months.

Proponents of "no-fault" plans contend that the fault concept has been destroyed because many tortfeasors escape responsibility for the injury and damage they cause. The widespread use of liability insurance, they claim, has eroded the concept of individual responsibility upon which the tort-fault system is based. They also claim that the fault system has little meaning since individuals may purchase first party insurance which will return benefits despite the negligence of the insured and no matter how much that negligence may have caused the damages and injuries he suffered.

Persons who raise such arguments fail to understand that the true purpose of the tort-fault system is not to punish tortfeasors. The entire fabric of the tort system is constructed around the premise that

one who causes injury to another should fairly and adequately compensate him for that injury.<sup>2</sup> Once liability is determined, it is the tortfeasor's obligation to see that the compensation is paid, either from his own assets, liability insurance, or other sources. The fact that the vast majority of motorists have purchased liability insurance proves that the general public has assumed this obligation.

Those who claim that the widespread use of liability insurance destroys the concept of individual responsibility fail to recognize some significant facts. In many automobile personal injury actions, there is always the possibility that the final verdict will exceed the limits of insurance coverage with the result that the insured will be personally liable for the excess. Even with adequate liability insurance coverage, it is foolish to say that the insured is not concerned about the possibility of a negligence action against him. Once involved in such a lawsuit, he will suffer personal inconvenience and possible financial loss due to his attendance at conferences with his counsel, attendance at depositions and trial. Liability insurance does not extinguish personal responsibility; if it did, there would be no valid justification for merit rating in computing auto insurance premiums.

It is true that the tort-fault system does not concern itself with persons who are injured through their own carelessness. Whether persons so injured should receive compensation is a social question, not a legal one.

The great percentage of the population is covered by first party accident and health insurance, hospital, and medical plans, and wage continuation programs. Such individuals have recognized the need for protection from the contingencies of sickness and injury which are not caused by anyone except possibly themselves.

Proponents of no-fault plans have recognized that it would be too costly to have one plan which would retain all features of the present system for innocent traffic victims, while offering added benefits to

\*The facts concerning the American Insurance Association plan upon which this critique is based were drawn from the report offered for study and comment by AIA as noted in footnote 1.

<sup>1</sup>American Insurance Association, *Report of Special Committee to Study and Evaluate the Keeton-O'Connell Basic Protection Plan and Automobile Accident Reparations*, at 5 (Oct 1968). The House of Delegates of the American Bar Association voted disapproval of the AIA plan at its mid-winter meeting held in Chicago January 27, 1969.

<sup>2</sup>See *Exodus* 21:5, 18 (RSV)

those who could not recover because of their own fault. Therefore, they declare fault meaningless and deny the innocent traffic victim his full, fair and adequate compensation so that all may recover limited benefits.
